AUG 2 1991

JUKADO COMBINES THE FUN AND EXCITEMENT OF A WONDERFUL PHYSICAL FITNESS ACTIVITY WITH PRACTICAL, EFFECTIVE, SAFE SELF-DEFENSE.

BRUCE TEGNER presents his original system of modernized jiu jitsu which he has named JUKADO. In JUKADO, utility and pleasure are joined. There are good, simple, workable defenses, adapted mainly from judo, karate and aikido and there is a progression of ranks for achievement goals—from white belt through black belt.

Whether you are a beginner, an experienced enthusiast or a teacher, you will find this book of great value. JUKADO is Bruce Tegner's most brilliant original contribution in the subject field.

"This is the most useful book on the Oriental fighting arts that I have ever seen."

Michael H. Dygert, LIBRARY JOURNAL

BRUCE TEGNER BOOKS REVIEWED

BRUCE TEGNER'S COMPLETE BOOK OF KARATE (2nd revised edition)

"... Tegner suggests and illustrates changes which would bring karate more in line with modern concepts of physical education ... invaluable as a guide to teaching karate in schools, colleges and recreation centers."

Dr. Ray Snyder, CAHPER

DEFENSE TACTICS FOR LAW ENFORCEMENT

Volume One: Weaponless Defense and Control

"... a comprehensive manual ... a practical tool applicable to police academy programs, pre-service police science programs at the university level and for the (individual) officer ..."

THE POLICE CHIEF

BRUCE TEGNER'S COMPLETE BOOK OF JUKADO SELF-DEFENSE: Jiu Jitsu Modernized

"This is the most useful book on the Oriental fighting arts that I have ever seen."

Michael H. Dygert, LIBRARY JOURNAL

SELF-DEFENSE YOU CAN TEACH YOUR BOY: A Confidence-Building Course (for elementary school age boys)

"The easy to learn defenses are safe and practical."
JOURNAL OF HEALTH, PHYSICAL EDUCATION and RECREATION

SELF-DEFENSE FOR GIRLS & WOMEN (with Alice McGrath, a physical education course for girls and women in secondary schools.)

"... The authors' advice is sound and their methods could easily be practiced in gym classes."

Charles Curran, LIBRARY JOURNAL

SELF-DEFENSE NERVE CENTERS & PRESSURE POINTS

"Students and teachers of unarmed fighting will find much valuable source material in this attractive book."

SCHOLASTIC COACH

SELF-DEFENSE FOR BOYS & MEN (A physical education course for secondary schools.)

"... recommended for school libraries. The text deserves inspection by physical education instructors."

Charles Curran, LIBRARY JOURNAL

KUNG FU & TAI CHI: Chinese Karate Forms and Classical Exercise

"... recommended for physical fitness collections."

Charles Curran, LIBRARY JOURNAL

BRUCE TEGNER is a specialist in sport and self-defense forms of weaponless fighting. He is regarded as this country's outstanding authority, teacher and innovater in the field.

He was, literally, born to the teaching of unarmed fighting skills; both his parents were professional teachers of judo and jiu-jitsu and they began to train him when he was two years old! Until he was eight years old, his mother and father taught him fundamentals; after that, he was instructed by Oriental and European experts.

In a field where most individuals study only one specialty, Mr. Tegner's background is unusual. His education covered many aspects of weaponless fighting and included instruction in sword and stick fighting, as well. Before he gave up competitive judo, he was the California state judo champion. He holds black belts in judo and karate.

Although Bruce Tegner was trained in the traditional manner, he originated a new style and method when he began to teach. He separated and distinguished between sport and self-defense forms of weaponless fighting. He introduced new concepts for modern applications of the ancient skills.

In the U.S. armed forces, Mr. Tegner trained instructors to teach weaponless combat, he taught military police tactics and he coached sport judo teams. He has trained actors and devised fight scenes for films and TV. From 1952 to 1967 he operated his own school in Hollywood where he taught men, women and children, exceptionally gifted students and blind and disabled persons.

Bruce Tegner has twenty-five books in print in this subject field, with additional titles in preparation. Many of his previous books have been highly praised by professionals in physical education and recreation. The books range from basic, simple self-defense to exotic forms of weaponless and stick fighting for experts and specialists. Bruce Tegner's books are used for physical education classes in public and private schools, recreation centers, law enforcement training academies and by enthusiastic individuals throughout the world.

BOOKS BY BRUCE TEGNER

BRUCE TEGNER'S COMPLETE BOOK OF SELF-DEFENSE:

BRUCE TEGNER'S COMPLETE BOOK OF KARATE

BRUCE TEGNER'S COMPLETE BOOK OF AIKIDO

BRUCE TEGNER'S COMPLETE BOOK OF JUKADO SELF-DEFENSE
Jiu Jitsu Modernized

BRUCE TEGNER'S COMPLETE BOOK OF JUDO

KARATE: Self-Defense & Traditional Sport Forms

KARATE & JUDO EXERCISES

STICK FIGHTING: SPORT FORMS

STICK FIGHTING: SELF-DEFENSE

DEFENSE TACTICS FOR LAW ENFORCEMENT:
Weaponless Defense & Control

SELF-DEFENSE NERVE CENTERS & PRESSURE POINTS

BRUCE TEGNER METHOD OF SELF-DEFENSE:
The Best of Judo, Jiu Jitsu, Karate, Yawara, etc.

SELF-DEFENSE FOR BOYS & MEN:
A Physical Education Course

SELF-DEFENSE YOU CAN TEACH YOUR BOY:
A Confidence-Building Course, Elementary School Age

SELF-DEFENSE FOR WOMEN: (With Alice McGrath)
A Simple Method for Home Study

SELF-DEFENSE FOR GIRLS & WOMEN: (With Alice McGrath)
A Physical Education Course

BLACK BELT JUDO, KARATE, JUKADO

AIKIDO and Jiu Jitsu Holds & Locks

JUDO FOR FUN: Sport Techniques

SAVATE: French Foot & Fist Fighting

KUNG FU & TAI CHI: Chinese Karate & Classical Exercise

Additional titles in preparation

AN APPRECIATION:

Richard Windishar, who demonstrates with me most of the techniques in this book, is the personification of the ideal Black Belt holder. His very high level of skill in the un-armed arts is impressively evident on the mat; it contrasts pleasingly with his personal modesty. To new and less able students he has been unfailingly generous with time and help. During the years that he trained and taught at my school he was, in every action, a positive influence and a good example. His help with my books is much appreciated.

BRUCE TEGNER

CONTENTS

THE STORY OF JUKADO / 23

DESIGNATION OF RANK BY BELTS AND OTHER SYMBOLS / 26

HAND CONDITIONING IS NOT NECESSARY / 27

WHAT KIND OF FIGHTING IS DONE IN THE MOVIES? / 27

WHEN TO HIT FIRST / 28

AN ARMED ASSAILANT: When to Defend / 28

DISTRACTION: For Use With Defenses Against Armed Attack / 29

DISTRACTION: For Use With General Defenses / 29

HOW TO IMPROVISE TRAINING AIDS AT HOME
- Accuracy and Coordination Ball / 30
- Hanging Bag for Impact Blows / 33
- Padded Surfaces for Fully Released Hand Blows
- Found Areas for Kicking / 33
- Mat Substitutes / 33

WHITE RANK—PRELIMINARY (Beginner—One Stripe)

BALANCE / 34
- Natural Stance / 35
- Boxing Stance / 35
- One-Point Balance / 36
- T-Position / 36
- Slide-Stepping / 37
- Leaping / 38

FIGHTING STANCES / 39

ON-GUARD STANCES / 43

THOUGHTFUL GUARD / 44

HAND POSITIONS FOR STRIKING / 45
- Edge of the Hand / 45
- Fist / 46
- Extended Knuckle Blow / 46
- Heel-of-the-Palm Blow / 47
- Finger Stabs / 47

FOOT POSITIONS FOR KICKING / 48
- The Toe / 48
- Ball of the Foot / 48
- Edge of the Shoe (or Foot) / 48
- Bottom of the Foot / 50
- The Heel / 50

MUSCLE REACTION: BODY REACTION / 50

NATURAL AND UNNATURAL GRIP / 52

SAFETY AND CONTROL / 52

THE RULES OF SAFETY / 54

HOLDS AND LOCKS: Practice Safety / 56

PULLING HAND AND FOOT BLOWS FOR SAFETY IN PRACTICE / 56

THROWING PRACTICE SAFETY / 58

SAFETY FALLS / 59
- Basic Back Fall / 59
- Basic Side Fall / 60

BREATH CONTROL / 61

DISTRACTION AND FEINTING / 63

HOW WHITE RANK (ONE STRIPE) IS AWARDED / 64

BLUE RANK—BASIC DEGREE

HOW TO STRIKE: Ten Basic Hand Blows / 66
- Edge of Hand Horizontal Blow—Palm Down / 66
- Edge of Hand—Vertical Blow / 67
- Edge of Hand—Palm Up / 67
- Edge of Hand—High to Rear / 68
- Edge of Hand—Low to Rear / 68
- Cupped Hand Finger Stab / 68
- Heel of Palm / 68
- Foreknuckle Blow / 70
- Side of Fist / 70
- Elbow—Straight Back / 70

HOW TO KICK: Ten Basic Foot Blows / 71
- Ball of the Foot—Straight Out / 72
- Bottom of Foot—Snap Kick to Front/ 72
- Edge of Foot—Snap Kick Forward / 72
- Bottom of Foot—Snap Kick Rear / 74
- Edge of Foot—Snap Kick Rear / 74
- Toe or Ball of Foot—Hook Kick Forward / 74
- Toe or Ball of Foot—Hook Kick Rear / 74
- Toe or Ball of Foot—Low, Forward / 74
- Edge of Foot—From Side to Side and Forward and Backward / 76

NERVE CENTERS AND PRESSURE PPOINTS:
- Vulnerable Areas of the Body / 77

FRONT BODY AREAS / 78
- Temple / 78
- Under The Ear Lobe / 78
- The Nose / 78

Up Under the Jaw / 78
Side of the Neck / 80
Side of Body / 80
Solar Plexus / 80
Elbow / 80
Forearm / 81
Knee / 81
Shin / 81
Instep / 81

REAR BODY AREAS / 82
Side of the Neck / 82
Kidney Area / 82
Behind the Knee / 82

HOW TO AVOID AND STOP ATTACKS / 84
Leaping/ 84
Dodge and Parry / 85
Blocking / 85

HOLDS AND LOCKS: Basic Techniques / 88

HOLDS AND LOCKS: (For Formal Demonstration) / 89
Basic Arm Bar / 89
Straight Arm Lock—Side / 90
Front Bent Arm Lock / 90
First Wrist Hold / 92
Bent Arm Lock—Rear / 92

USES OF HOLDS AND LOCKS:
Showing Attack, Defense, and Takedown / 94
Basic Arm Bar / 94
Straight Arm Lock—Side / 94
Front Bent Arm Lock / 96
First Wrist Hold / 96
Bent Arm Lock—Rear / 98

FALLS / 100
Standing Back Fall / 100
Step and Pivot / 102
Step and Sit Fall / 104

THROWING AND BEING THROWN (Receiving) / 105

PRE-THROWING ACTION / 106

THROWS / 106
Back Takedown / 106
Straight Foot Throw / 108
Kick Back Throw / 108

DEFENSES AGAINST MINOR (NON-VICIOUS) ATTACKS

DEFENSES AGAINST WRIST GRIPS / 111
Two-Handed Grip Against One Wrist / 111
Two-Handed Grip Against Both Wrists / 112
Shoulder Grab Defense / 114
Front Under-Arm Grab Defense / 114
Front Over-Arm Grab Defense / 116

DEFENSES AGAINST VIOLENT ATTACKS / 116
Close-In Fist Attack: Grab and Hold Defense / 116
On-Coming Fist Attack / 119
Rear Body Grab—Under Arms / 120
Club (or Stick) Defense: Over-Head Attack / 122
Knife Attack: Defense Against Straight-In Thrust / 123

SURPRISE ATTACK: TRAINING FOR RESPONSE AND DEFENSE / 124
Front Surprise Attack / 124
Rear Surprise Attack / 125

GIVE AND TAKE SPARRING / 127

HOW TO TAKE THE BLUE RANK TEST / 128

BROWN RANK—INTERMEDIATE DEGREE (One Stripe)

HOW TO STRIKE: Ten Intermediate Hand Blows / 132
Two-Knuckle Punch—Straight Out / 132
Two-Knuckle Back-Handed Blow / 132
Foreknuckle Blow—Rear / 133
Open-Handed Finger Stab—Front / 133
Open-Handed Finger Stab—Rear / 133
Forearm Blow—Outside Edge / 133
Forearm Blow—Inside Edge / 134
Elbow—Front / 134
Elbow—High Rear / 134
Elbow—Rear, Vertical / 135

HOW TO KICK: Ten Intermediate Foot Blows / 135
Edge of the Foot—Forward / 135
Edge of the Foot—Side / 135
Edge of the Foot—Rear / 135
Knee / 136
Inside Edge of Foot—Forward / 136
Bottom of the Foot Stamp—Rear / 136
High Arc Kick / 136
High Stamp Kick—Rear / 137
High Stamp—Forward / 137
Hook High / 137

NERVE CENTERS AND PRESSURE POINTS:
Vulnerable Areas of the Body / 138
Front / 138
Rear /140

KICKING DEFENSES / 142
Toe Kick Defense / 142
Knee Kick Defense / 142
High Kick Defense / 143

HOLDS AND LOCKS (for Formal Demonstration / 143
Second Wrist Hold / 143
Under Arm Lock / 144

Straight-Up Arm Lock / 144
Choke Hold: Knuckle in the Back / 146
Bent Arm Restraining Hold / 146

USES OF HOLDS AND LOCKS:
Showing Attack, Defense, and Takedown / 148
Second Wrist Hold / 148
Under Arm Lock / 148
Straight Up Arm Lock
Choke Hold: Knuckle in the Back / 150
Bent Arm Restraining Hold / 150

FALLS / 150
Basic Side Roll / 150
Forward Roll—Staying Down / 152
Forward Roll—Coming Up / 153
Intermediate Side Fall / 153

THROWS / 154
Hip Throw / 154
Sweeping Foot Throw / 156
Hip and Straight Foot Takedown / 156

DEFENSES AGAINST ATTACKS / 158
Front Choke Defense / 158
Fist Attack—Close In: Three Blow Defense / 158
Fist Attack—Out of Range: Parry Defense / 160
Back Body Grab—Over Arms / 160
Rear Choke with Forearm / 160
Club Attack—Back-handed / 162
Knife Attack—Slashing Style / 162

FREE-STYLE SPARRING / 164

HOW TO TAKE THE TEST: BROWN RANK (One Stripe) / 166

BROWN RANK—ADVANCED DEGREE (Two Stripes)

HOLDS AND LOCKS (for Formal Demonstration) / 167
Control Side Hold / 167
Choke Hold To Side of Neck / 168
Hand and Arm Hold / 168
Hand and Arm Hold, Cross-Body / 168
Straight Down Arm Lock / 170

USES OF HOLDS AND LOCKS:
Showing Attack, Defense, and Takedown / 170
Control Side Hold / 170
Choke Hold to Side of Neck / 170
Hand and Arm Hold / 172
Hand and Arm Hold, Cross-Body / 172
Straight Down Arm Lock / 173

FALLS / 173
Intermediate Side Roll / 173
Intermediate Side Leaping Roll / 174
Forward Fall / 174

THROWS / 176
Lateral Dash Throw / 176
Inner Hook Throw / 176
Over-Shoulder Throw / 178

DEFENSES AGAINST ATTACKS / 178
Front Choke—Defense Number 2 / 178
Close-In Fist Attack—Block and Leap Defense / 178
Fist Attack—Out of Range / 180
Rear Finger Choke / 180
Hair Pulling Defense / 182
Shoulder Grab Defense / 183
Club Attack—Side Swing / 183
Knife Attack Threat—Low Crouch Style / 184
Knife Attack Threat—High / 184

ABOUT BRUCE TEGNER

Bruce Tegner is regarded as the most experienced instructor in America in the field of the Oriental fighting arts for sport and self-defense. By an interesting coincidence, his birthday is the same as that of Dr. Jigaro Kano, founder of judo. Dr. Kano was born on October 28, 1860; Bruce Tegner was born on October 28, 1929. Dr. Kano made his important, original contribution to the fighting arts by modifying the ancient jitsu of throwing techniques and developing it into a sport. He clearly defined the differences between sport and self-defense training. Bruce Tegner, with the founding of jukado has made an important, original contribution to the arts by adapting them to this century. His system is appropriate to western culture and to the practical needs of the modern student.

Born, literally, into judo-jiu jitsu, Bruce Tegner has had a lifetime of training, teaching, and researching the unarmed arts of the Orient and Europe. Both his parents were black belt holders and professional instructors in judo for sport and jiu jitsu for self-defense. His mother and father taught him the fundamentals of judo, karate, and jiu jitsu until he was eight years old; then he was trained by high-ranking Oriental and European masters. In an area where specialization is the rule, Bruce Tegner's training was unusual; he was taught many different kinds and types of unarmed fighting, and sword and stick fighting as well. He became familiar with the different styles of karate which had developed in the various Asian countries.

His professional teaching experience began before he was fifteen, an age at which most youngsters are only beginning their training. At seventeen he was the youngest judo black belt on record in the United States. His Second Degree Black Belt was won in contest and in 1949 he was California State Judo Champion.

Believing that tournament training is not compatible with teaching activities, Bruce Tegner gave up competition and devoted his full time and energy to teaching, research, and writing.

In the US Armed Forces, Bruce Tegner was an instructor to teachers of weaponless combat and he coached special services sport judo teams.

From 1952 to 1967 Bruce Tegner had his own school in Hollywood where he taught thousands of men, women, and children. At the present, he is giving full time to writing, continued research, and lecture-demonstrations.

THE STORY OF JUKADO

Jukado was founded by Bruce Tegner in 1963. It was the culmination of many years of teaching and researching in the field of the Oriental and European unarmed fighting arts. The word jukado does not have a meaning in Japanese; it is formed of three syllables taken from the words judo, karate, and aikido. The techniques in jukado are taken mainly from these three forms of weaponless fighting; it is a completely modernized version of what is commonly known as jiu jitsu. The jukado system of rating proficiency (by belt color or rank designation) is Bruce Tegner's brilliant, original contribution to the field.

The old-fashioned way of teaching the unarmed fighting arts—jiu jitsu, karate, kung-fu, aikido, etc.—is stubbornly rooted in the ways of the feudal Orient. The method of teaching, the selection of techniques, the relationship of teacher to student, all are reflections of a formal society and of conditions quite unlike those of the modern world.

Because the unarmed arts were taught for warfare, the sole purpose of the training was to make killers of the selected few who were thought capable of learning. The training was harsh and brutal, as befitted the aim. Even when weaponless fighting for warfare became outmoded, the attitude of the teachers remained the same; it had become formalized through the years. Even when the training no longer had the purpose of killing, the techniques included unnecessarily vicious ways of dealing with relatively simple situations. The relationship of the teacher to the student was that of a tyrant to his slaves. It is, unfortunately, still the attitude of many teachers of judo and karate today, even outside Japan.

Because Oriental culture is highly formal, practices become stylized and rigid; there evolves a "correct" way of doing things. Once set, this "correct" way is frozen into a cultural pattern. With the original purpose gone, the pattern continues to be followed. The traditional method of teaching is as rigid as the tea ceremony. No one in his right mind would suggest that it is not possible to make a good cup of tea without going through the ceremony. The cup of tea which results from the tea ceremony is the least important part of the procedure. As a choreographed, visually beautiful relic of old Japan, the tea ceremony is lovely; as a way of making tea it would hardly do for every day.

Yet, the same frozen attitudes which might insist on the tea ceremony for daily use, persist in the teaching of the unarmed fighting

arts for self-defense today. The old system of teaching is, at its best, a relic of the charm and etiquette of feudal Japan; at its worst it is brutal. Unlike the tea ceremony, it had its beginnings not in the drawing room but on the battlefield.

Though Bruce Tegner was trained in the traditional method of learning the Oriental arts, he began to introduce changes as soon as he began to teach. He began to experiment with more modern methods of teaching while he was still in his teens. His first innovation was to eliminate the harshness and brutality from the classroom. Instead of making corrections by hitting and humiliating his students, he explained their mistakes and gave them encouragement to improve. The old-fashioned teacher made the early training deliberately difficult in order to weed out the less able. The people who were thus prevented from learning self-defense were actually those who needed self-defense training the most! Those who could survive the early training were those who needed training the least. Bruce Tegner found that patience and encouragement kept the self-conscious student in training. This modern approach to teaching, which is used in many fields, athletic and intellectual, is still resisted with ferocity by dogmatic instructors of the unarmed arts.

Along with the change in attitude toward his students, Bruce Tegner first modified and then completely dropped the ceremonial trappings in his classroom. Ceremony which has no emotional or philosophical meaning for the person doing it is foolish and demeaning. As a student, Bruce Tegner was required to bow to a Shinto shrine and to *both* the American and Japanese flags before beginning a session of judo practice. As a teacher, he eliminated this meaningless procedure and found that his students learned more quickly when they were relieved of the embarrassment of exotic ritual.

The next phase of improvement which Bruce Tegner introduced was the classification of techniques according to usefulness and simplicity. He differentiated between those which were possible for most students to learn and *remember* and those which were very difficult to learn and remember; he differentiated between those which were useful as training procedures only and those which had practical application as well; he realized and emphasized the fact that different techniques work best for different students, that individuality is an important factor.

He made the startling proposal that the *least* competent student should be encouraged to stay in training, not only for self-defense, but for sport! Whereas previously only the potential champion was urged to continue his training, Bruce Tegner urged anyone who had an interest in the sport to use it as recreation. He was pro-

posing that the same attitude be taken to judo and karate as is taken to tennis; that there be many levels of play and that those with the ability and interest to become champions do so, but that the majority of people participate at their own level of competence for pleasure, health, and diversion.

Another important innovation which Bruce Tegner made to the teaching of self-defense skills was his presentation of "types" of defenses which could be used in "types" of attacks, in place of the old method of training which taught every defense as a "trick" which was used in a specific attack. To learn all the "tricks" of jiu jitsu did, indeed, take many years. In the course of working with thousands of students, Bruce Tegner found the most useful groups of general defenses which worked best for most people, thus eliminating the need for spending years in training to learn practical self-defense. The development of his method of training was greatly accelerated during the time he taught in the Armed Forces. There, the urgency of the situation imposed the necessity for faster methods of training than had ever been used before. Bruce Tegner's teaching methods were appropriate and successful in that situation.

After leaving the service, Mr. Tegner continued to improve his training methods, always with the aim of adapting them to the needs of the students. The popularity of his school in Hollywood was evidence of the enthusiasm with which his training methods were received. In his school he specialized in teaching self-defense and the students he taught were widely diversified. He taught law-enforcement officers, movie stars, professional people, working people, the very young and the old, the mentally retarded, and the intellectually brilliant who were physically timid.

In 1963, as the result of student interest, Mr. Tegner began to teach his method of self-defense with a completely new approach; he added to the practical self-defense training course a system of rating proficiency by ranks or colored belts, and called his new system jukado. He awarded the first blue belt rank in June, 1963. In November, 1963, he presented a general set of requirements for jukado rankings, which were revised in 1967. The revisions were the result of student response, interest, and need. For the first time, the instructions for learning jukado are presented here. For the first time, a practical, modern course of self-defense with a system for rating achievement and proficiency is available to the public.

DESIGNATION OF RANK BY BELTS AND OTHER SYMBOLS

The monks who developed forms of unarmed fighting for use against the bandits of feudal China, and the Japanese peasants who trained secretly to fight armed Samurai warriors, needed no outward symbol of their fighting proficiency. In their original forms, none of the unarmed arts had ranks, degrees, or belts.

Awarding belts for proficiency in sport judo was begun in 1882 — many, many years after the throwing jitsu were developed. In karate, belts have become common as a symbol of rank only since the early 1950's! There are forms of the fighting arts which have only awarded ranks since the 1960's.

The colors of belt ranks, and what they symbolize, vary from country to country, from style to style and even within styles, depending on the teacher. Belt ranks are not recognized from one style to another, or from one kind of fighting art to another. The choice of belts of different colors to symbolize rank in sport judo was made by its founder, Dr. Jigaro Kano. There were, at that time, certain types of clothing and adornment which symbolized rank in social life. These were symbols of class permitted only to the members of that class and forbidden to the common people. Culturally, it was a highly class- and rank-conscious society. The choice of a belt symbol was very natural in a culture which regarded clothing symbols as symbols of caste.

Because the judo uniform (and copying it, the karate uniform) are simply variations of what was then ordinary street dress — the kimono — the uniform is not especially suited for practice of either judo or karate, but it has become the custom.

Custom is hard to change; the custom of using the judo uniform for practice of many types of the unarmed arts continues. There is a trend away from this costume and there is no real necessity for insisting on its use. Where different types of training clothes are used, there will have to be different types of proficiency awards given. It is for this reason that I use the words "rank" and "belt" interchangeably. There will be increasing numbers of groups who will train in sweat shirts and old pants. For these people, a belt symbol of rank would be inappropriate; more appropriate would be a cloth patch, distinctive stripes, or some other symbol of advancement in place of the traditional colored belt. There will be, I hope, increasing numbers of clubs which will formulate original and creative ways of existence. Among them there will be original training clothes and original ranking designations. This is a devel-

opment to be encouraged. Proficiency, whether it is designated by belt, patch, stripes, or any other symbol, has real meaning to the person who has worked hard to earn the rank, who appreciates the effort and time which have gone into his training, and the satisfaction which comes to him when he has reached certain goals which represent progress and achievement.

HAND CONDITIONING IS NOT NECESSARY

Hand conditioning (hardening and callusing the hands) is not necessary for modern self-defense. In ancient times it was practical and necessary; the unarmed peasants who fought armored Samurai soldiers needed to toughen their hands into weapons. Today the situation is much different and we are not trying to kill with a single blow! Hand conditioning can result in deformity which is permanent; it impairs the flexibility of the hands; it is unattractive in appearance; it gives the impression of aggressiveness. In a word — DON'T. It is true that the spectacular stunts of brick breaking and the like cannot be done except with heavily conditioned hands, but those stunts are not essential for practical, useful, effective self-defense training.

WHAT KIND OF FIGHTING IS DONE IN THE MOVIES?

In reply to the question above, frequently asked, there is an answer: It is theatrical fighting. You should not confuse the make-believe world on film with actual conditions on the street.

The choice of techniques in a film fight scene is not based on the practical, but on the spectacular; the more gaudy the scene, the more successful it is. It is not intended to demonstrate the useful and simple self-defense techniques which would work on the street.

In films, the hero wins because that is the way it is written in the script. Whether he can actually fight or not is entirely beside the point. The stunt man, who plays the villain and has to lose the fight, is usually a man with greater stamina and fighting ability than the actor-hero; he loses the fight because that is the job he is paid to do! Compare the situation with that in which the actor plays the role of a lawyer; for the interval when we see the film, we believe utterly and completely, for instance, that the late Spencer Tracy is a fine, competent, wise attorney. We would be innocent to the point of imbecility if, after the film, we asked the movie star for his opinion on legal matters. We could believe utterly and completely in Spencer Tracy in his fight scene in *Bad Day at Black Rock,* because he was a fine actor and the film was well done. It makes no difference at all whether Spencer Tracy could, outside of the film, defend himself in the same effective way. Just remember that films are not made for your instruction; they are made to entertain.

WHEN TO HIT FIRST

"Offensive" defense measures may seem to be a contradiction. Not so. The aggressor in a fight is the one who insists on fighting, not necessarily the one who strikes the first blow. Clearly, when an adversary moves in to attack, you move as quickly as you can; you do not have to wait for him to hit you first. There are many situations in which a bully announces his intention to fight, or challenges you to a fight, giving you enough time to decide on your course of action. If you make it perfectly clear (to him and to any possible onlookers) that you do not want to fight, that you prefer not to fight, and he still insists on fighting, you are altogether justified in taking action first.

When attack is certain, you gain a psychological advantage when you go into action first. By moving first, you might end the fight with one blow. In the instance of a gang attack, a successful defense is much more certain if you take the initiative.

You are *morally* the defending man when you have tried to avoid a fight, even if you strike first.

AN ARMED ASSAILANT: When to Defend

When threatened by an armed adversary, no matter how well trained you are, the prudent action is to make every effort to avoid physical action. As you must realize by now, this is the attitude which I advocate when you are confronted by any threat of violence; it is even more important when your adversary carries a weapon. Some situations of armed threat of attack call for action even if you are not highly trained or skilled, because the alternative might be passive acceptance of death or serious injury.

Unprovoked, motiveless, unpremeditated armed attack is very rare. Even though it seems you read about such attacks often, it is *because* they are rare and exceptional that they make the headlines. Most threats of armed attack have a motive. It is very important that you decide what the situation is before you rush into action or fail to act when that is necessary.

When the motive for threat with a weapon is robbery — the most common motive — your only sensible action is to offer no resistance. An armed assailant has an advantage over you which is worth challenging when you are defending your life or avoiding serious injury, but it is not worth challenging for the sake of money! A prudent, reasonable person threatened with gun or knife by a robber will quietly assure the man that no effort will be made to interfere with his plans.

If you are faced with threat of gun attack and the motive is not robbery, you might know your assailant. You must decide if you can reason with him (or her); if you cannot use reason and the assailant really intends to kill you, you must go into action with the appropriate defense.

When the motive for armed attack (knife, chain, bottle, etc.) is "thrill," you have no choice except to go into action as quickly as possible; such an assailant cannot be reached by reason. Whatever chances you take are worth it, for this specimen of unhumanity is encouraged by passivity and the less resistance you offer to him the more cruel he will be.

The general rule is: AVOID CONFRONTATION if you can; if you must defend your life, do it with spirit and determination.

DISTRACTION: For Use With Defenses Against Armed Attack

Distraction, which is a most useful aid to many defenses, is essential when making a defense against an armed attack. If you can confuse or disorient the assailant only for the fraction of a second and take his mind off his intended attack, this is precious time in which to take action. For use with armed attacks, the distraction must be very subtle — a slight movement of hand or foot, just enough to make him look in that direction but not enough to startle him. Use the feinting principle to decide what type of distraction will be most useful; if you intend to kick first, a slight hand movement is appropriate; if you intend a parrying action, a subtle shifting of a foot will do. Some situations will allow you to use verbal distraction — whispering something which makes him concentrate on your voice for an instant, for example. Gross movements should be avoided because a nervous or agitated gunman might be provoked into shooting if you startle him with obvious gestures.

DISTRACTION: For Use With General Defenses

Except when the threat of attack is made by an armed assailant, distraction can be in the form of yelling, throwing objects at hand, or making wild gestures which would make it difficult for your assailant to anticipate your next movement. Feinting tactics used as distraction and diversion are very useful as an aid in street defense.

HOW TO IMPROVISE TRAINING AIDS AT HOME

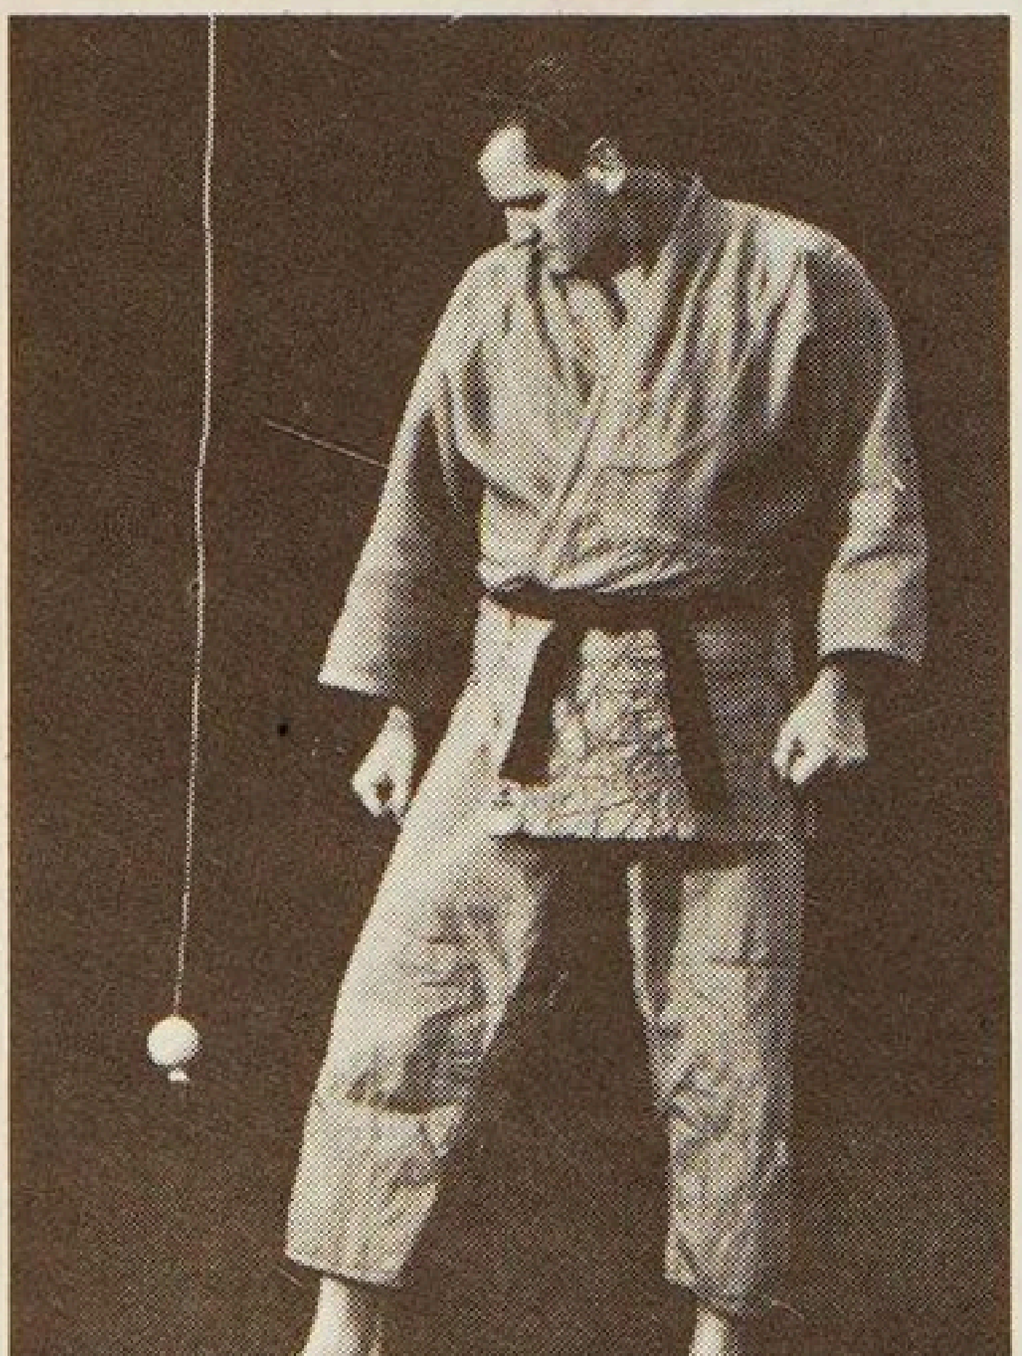
Accuracy and Coordination Ball

Among the improvised home training aids which you can set up for practice alone, the swinging ball is one of the very best. Depending on the facilities you have available, you can hang the ball from a ceiling, a door jamb, or any other location which permits it to swing freely. You can make your own variation but most of my students do it thus: Using a solid rubber ball 2 to 3 inches in diameter, force a piece of cord through its center with a screwdriver. Knot the cord. Using a length of cord which allows you to position the ball at knee height at the lowest point, run the cord through a small pulley which is fastened to the ceiling or door jamb. You should be able to raise and lower the ball so that you can practice hand and foot blows.

The amount of accuracy which is needed to hit the little ball is much more than you would ever need to hit an assailant. Striking at a small, swinging ball develops a high degree of precision. This is excellent all-around coordination exercise, as well. Do not attempt heavy blows against the ball; light, precise, well-timed blows are what you are trying for.

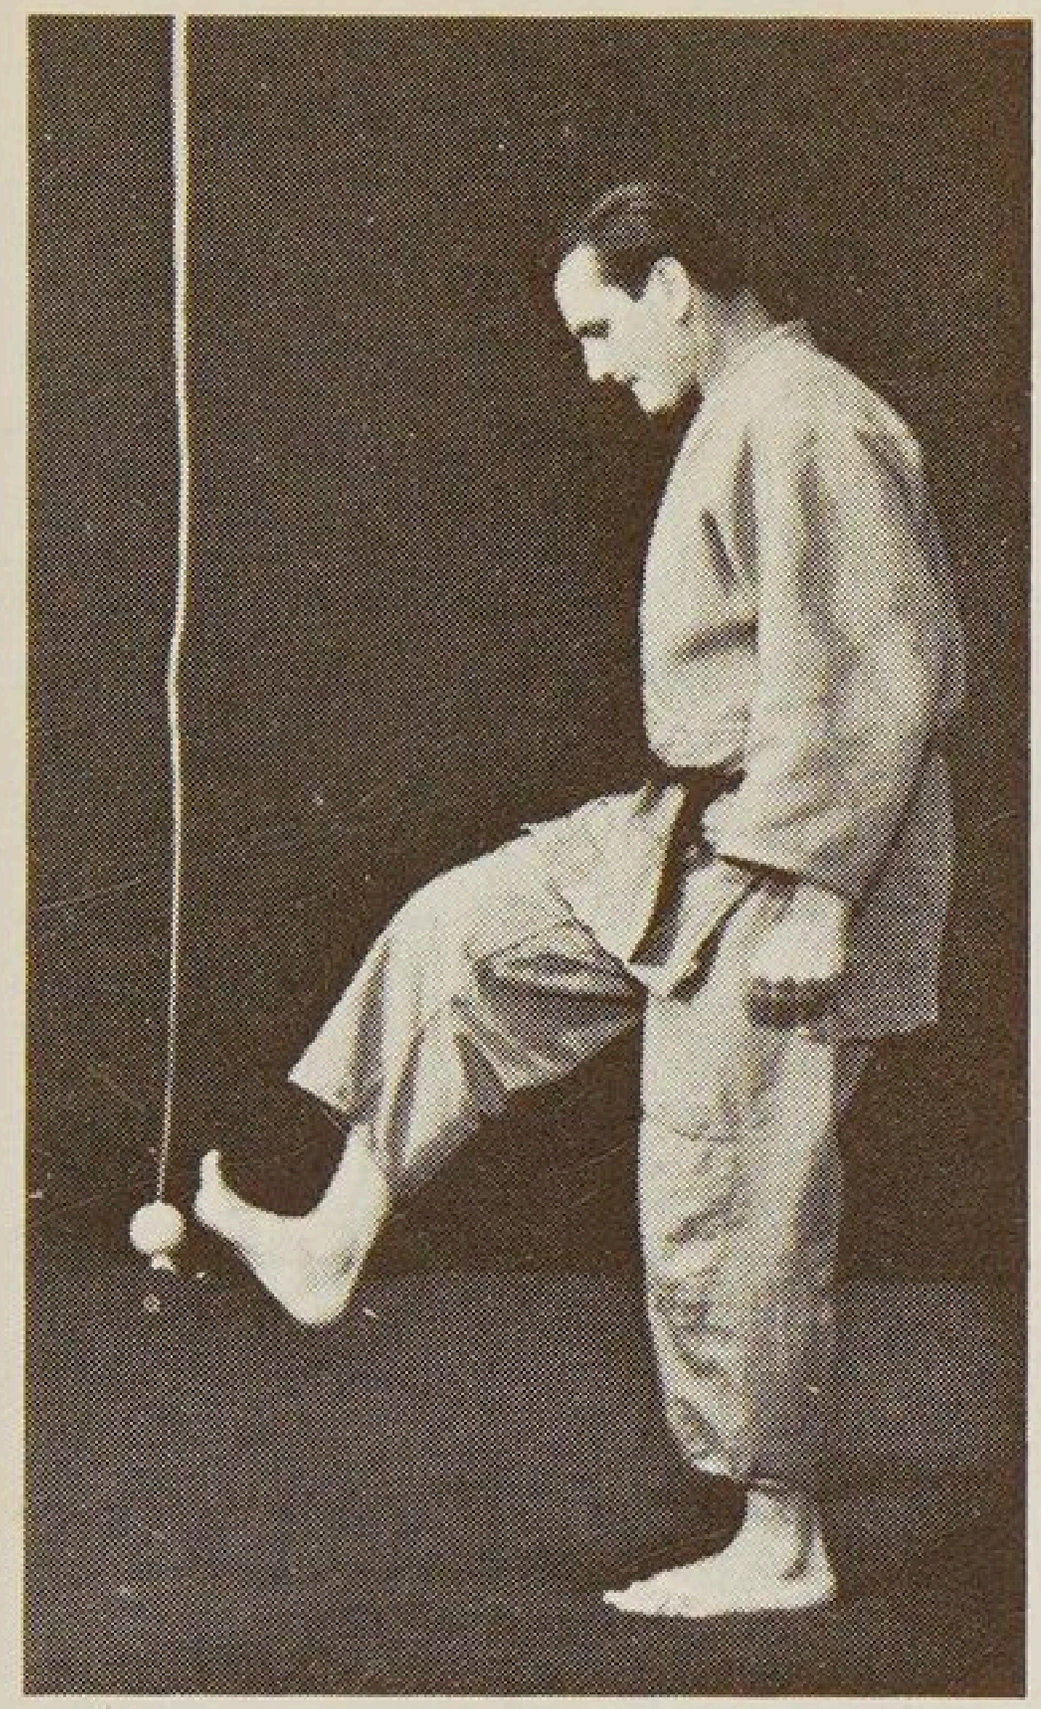
1 to 4. With the ball lowered to your knee height, strike at it with a variety of foot blows, trying for as many consecutive hits as you can. Alternate feet as you practice. You may find it difficult to deliver more than two consecutive kicks when you first begin to practice. Do not be discouraged; practice will improve your accuracy.

1

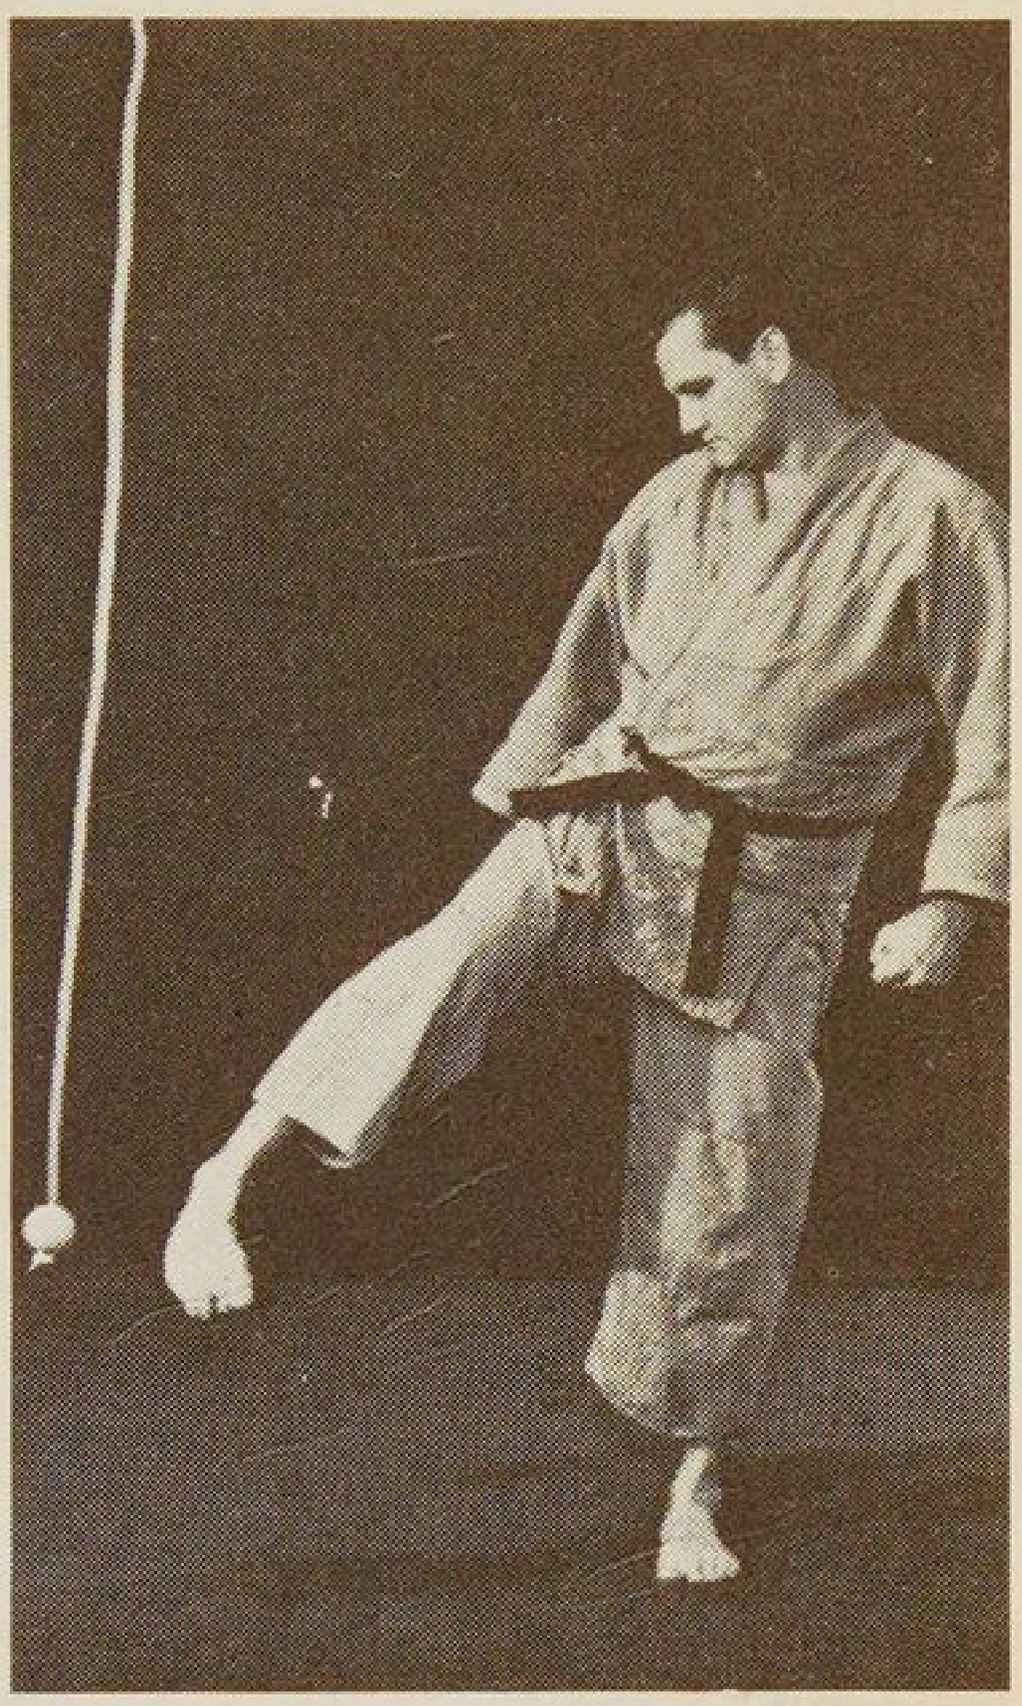


2

3

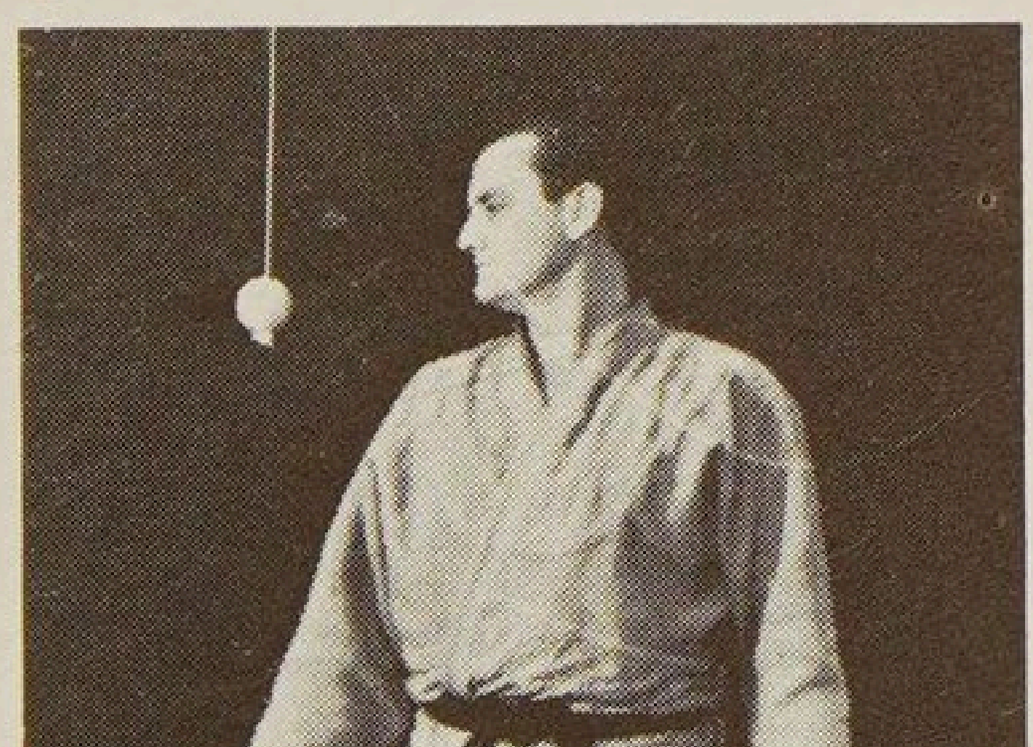


4

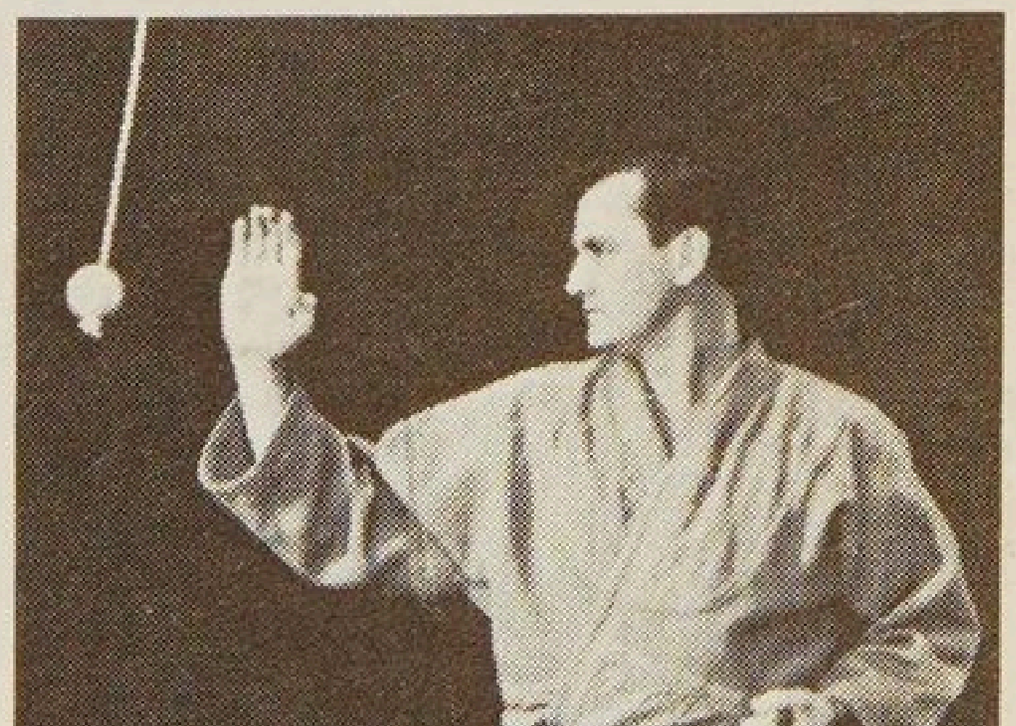


5 to 10. Raising the ball to your face height, strike a variety of types of hand blows, using both hands alternately. Light, precise well-timed blows are what you are trying for.

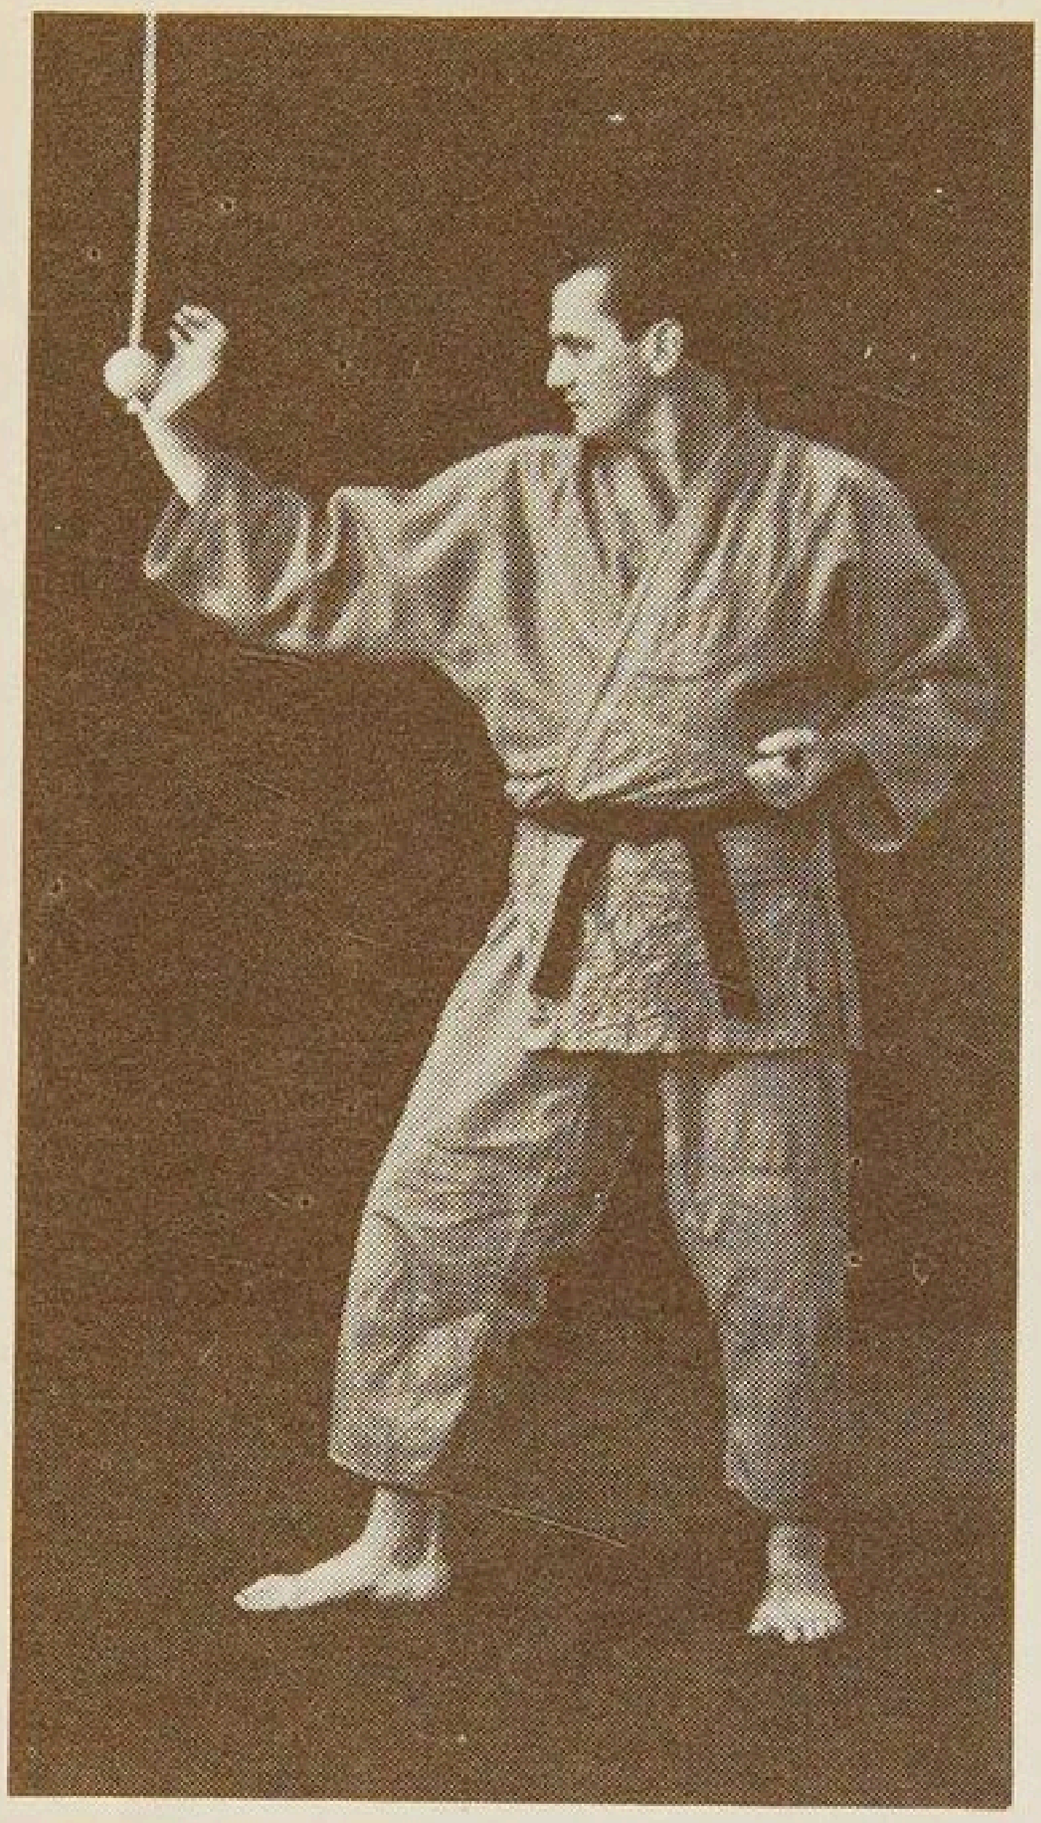
5



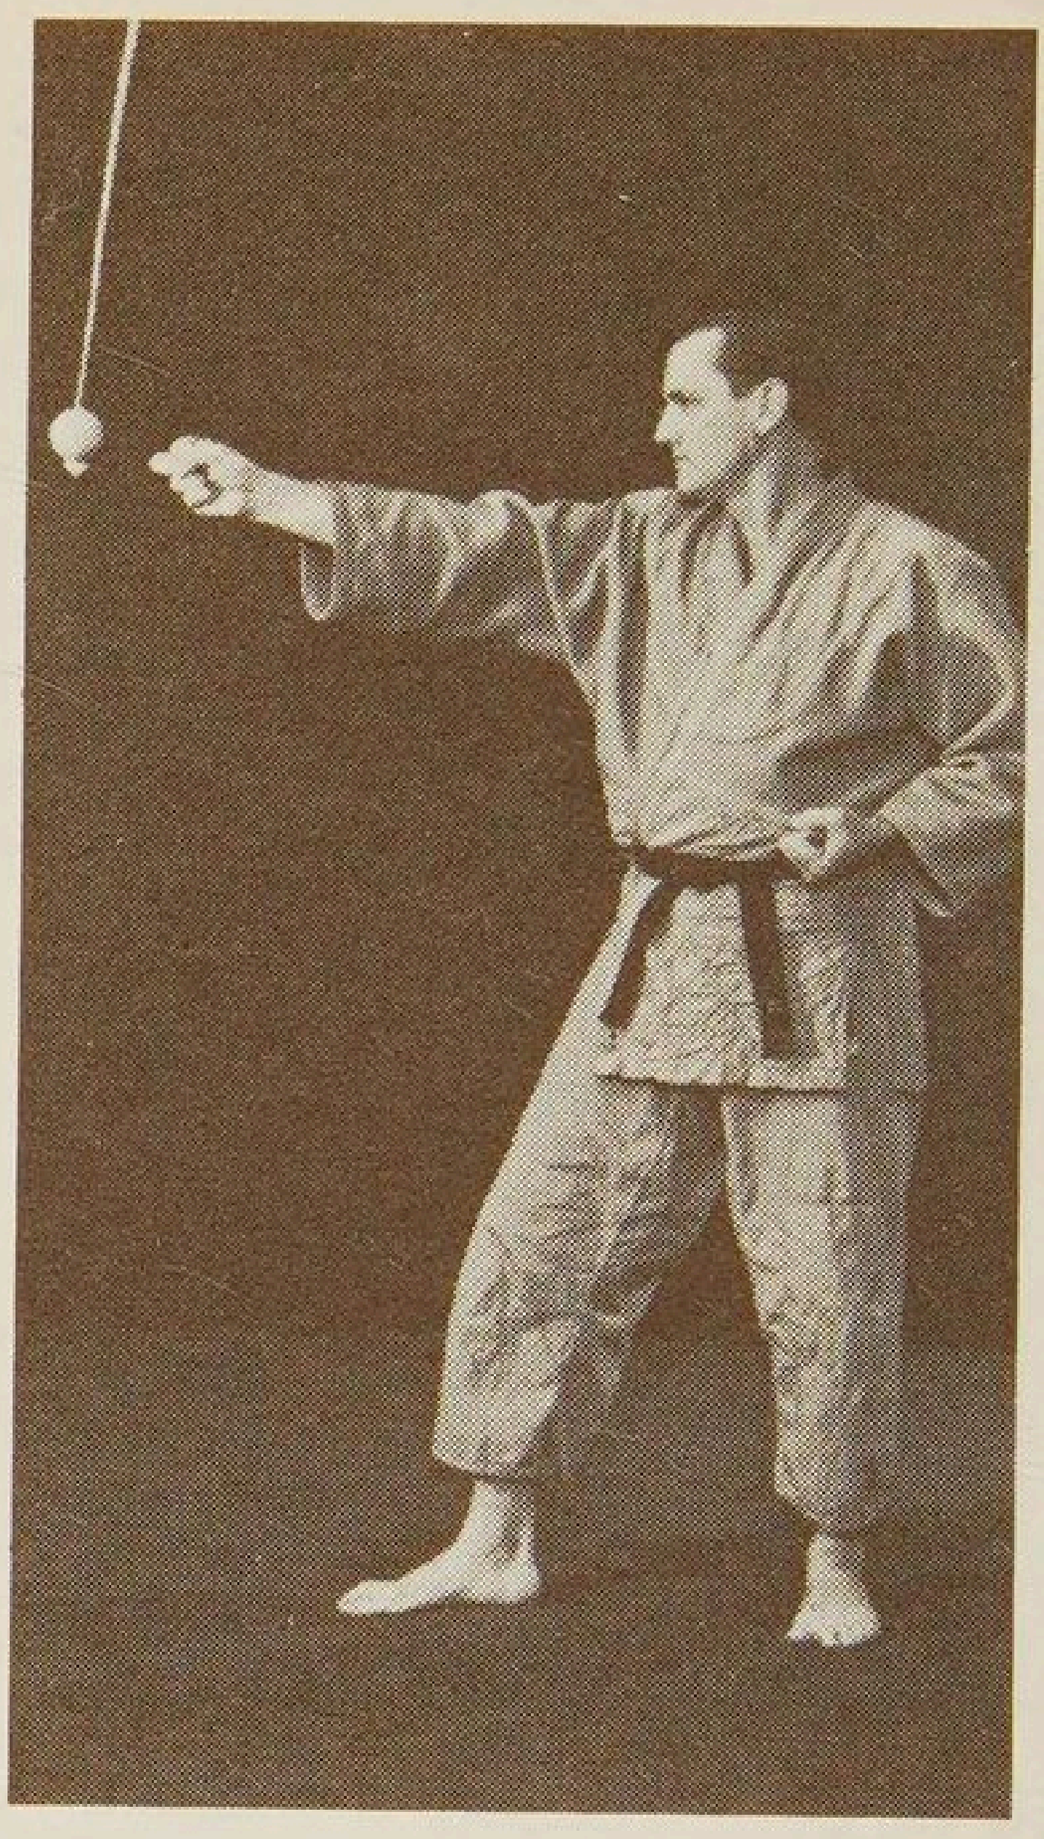
6



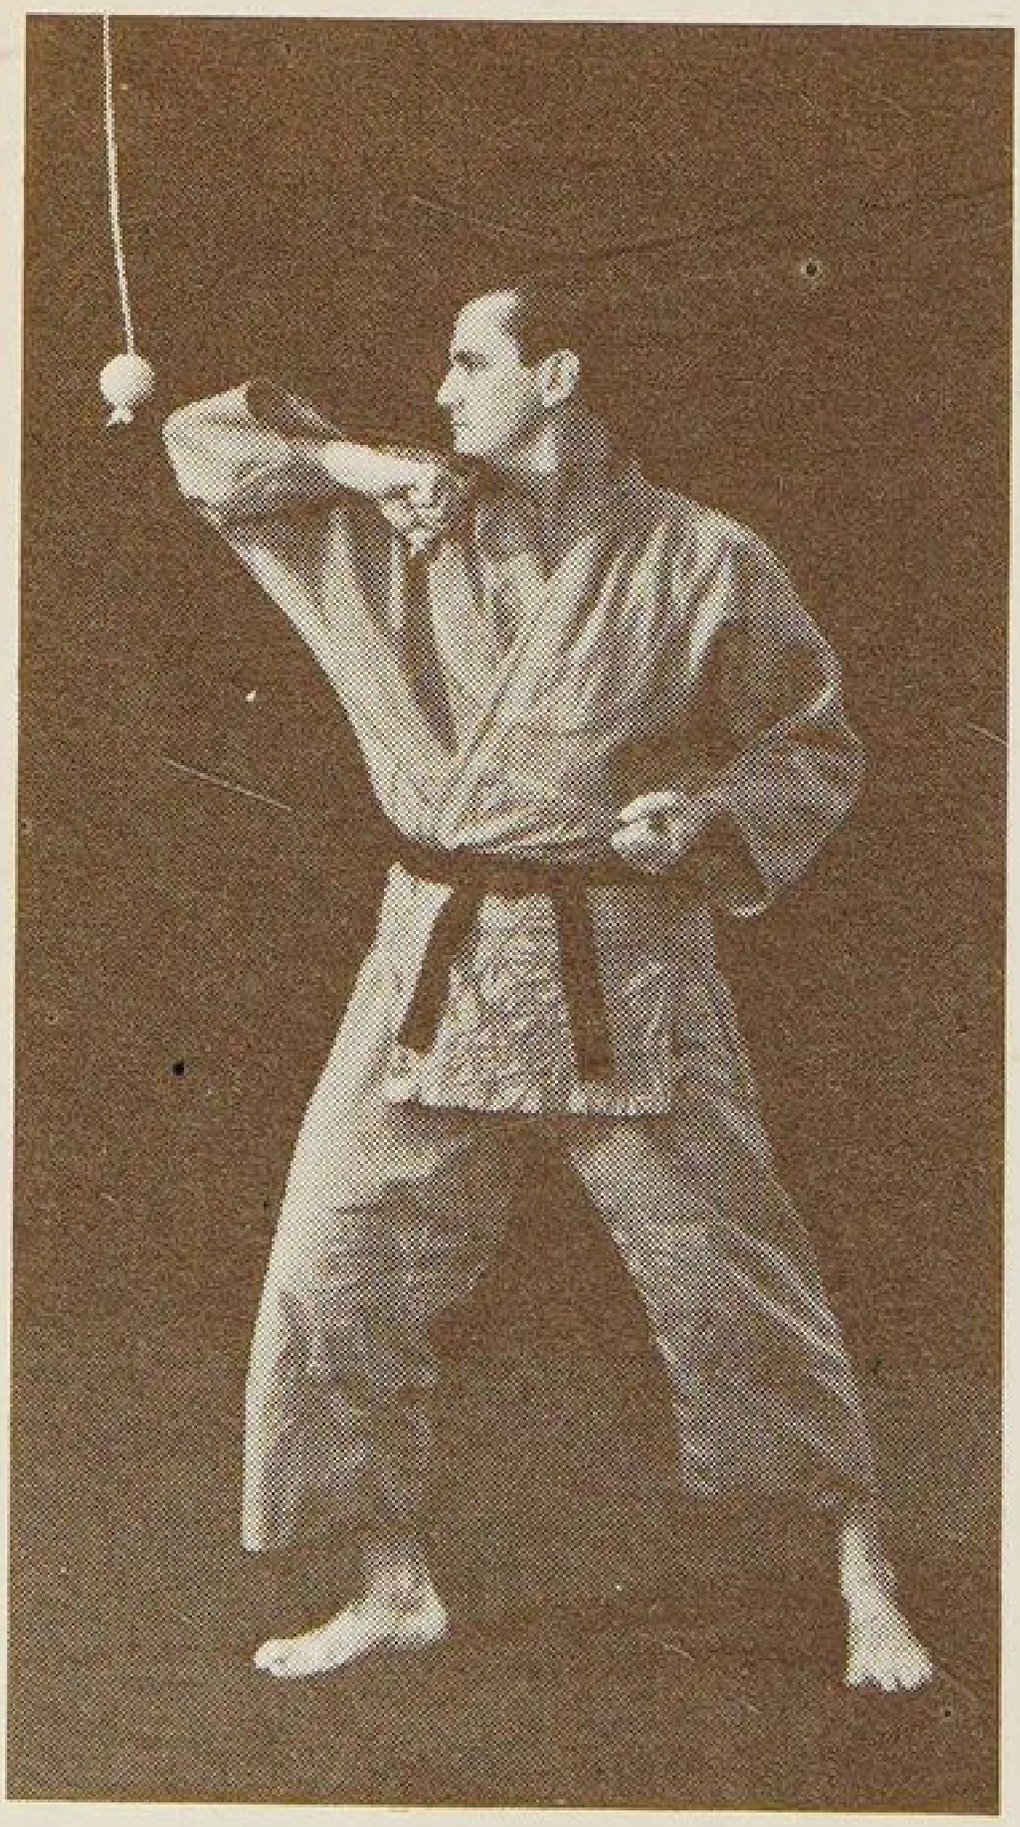
7



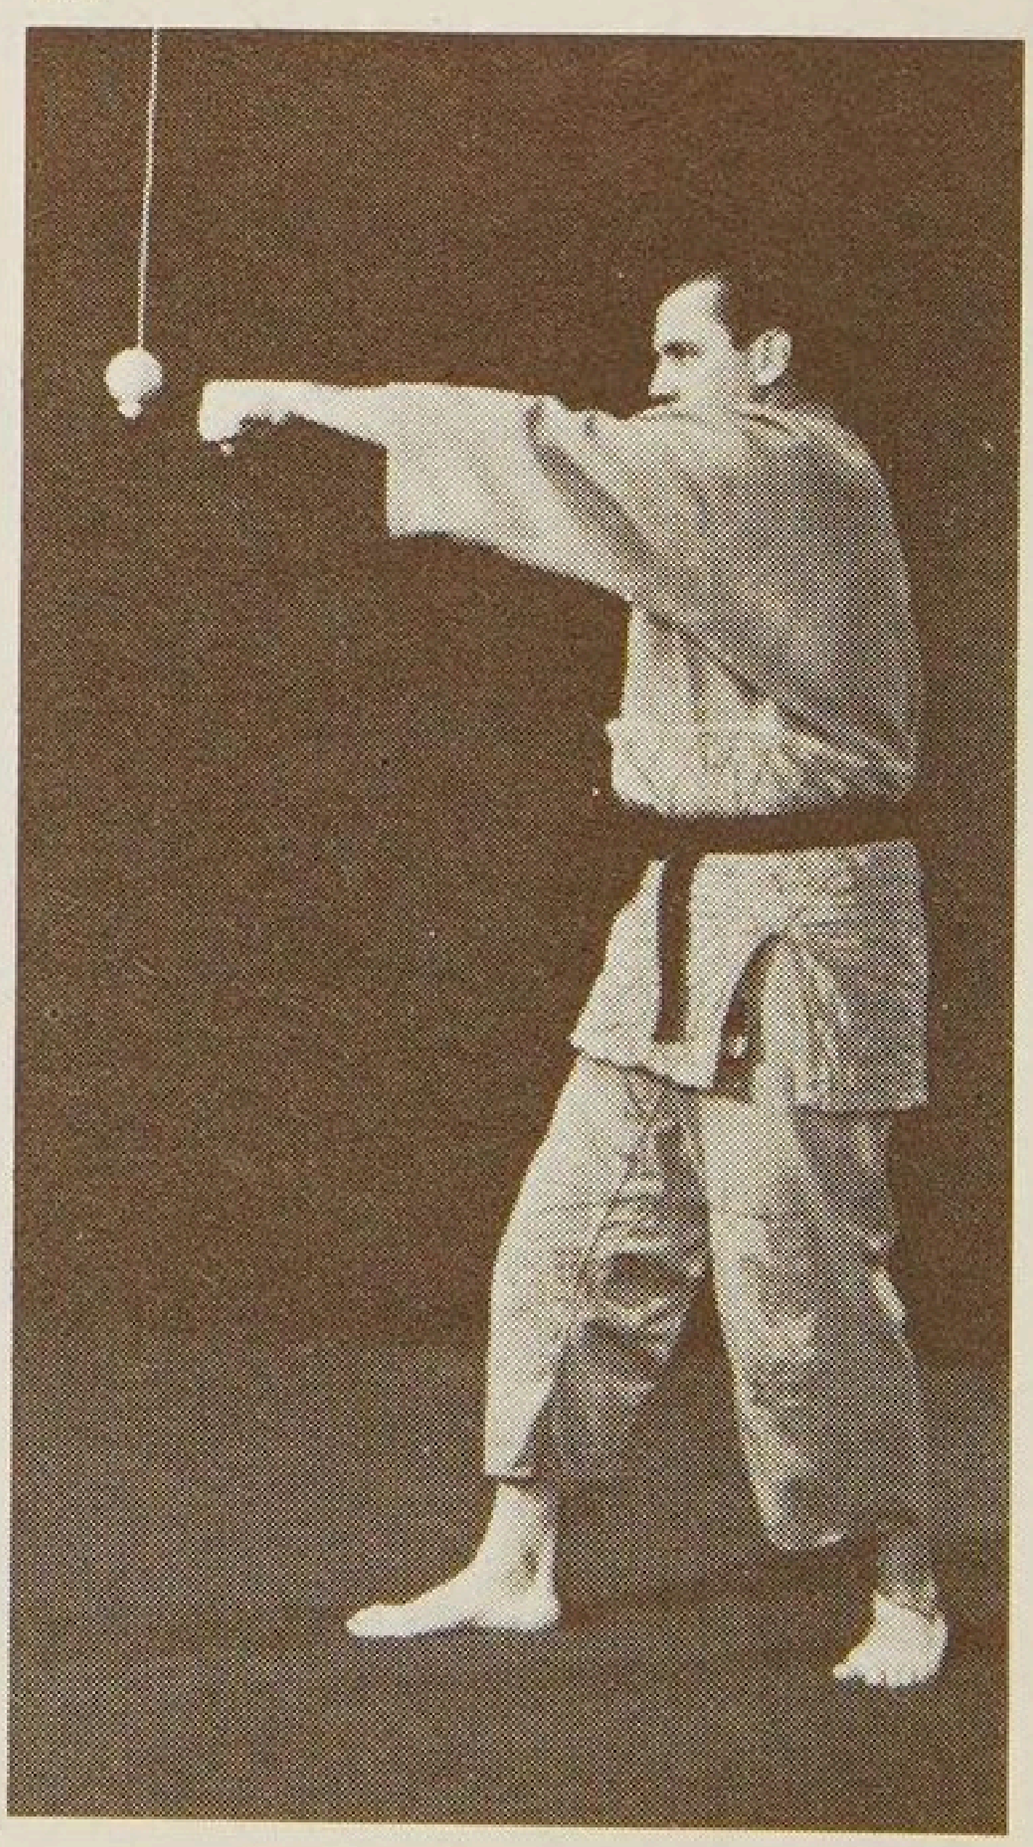
8



9



10



Hanging Bag for Impact Blows

To allow you to get the feel of a fully released hand or foot blow, you can improvise a hitting bag thus: Using a duffle bag or similar heavy canvas bag, fill it with wood shavings, sawdust, rags, or similar material. Avoid using anything which has sharp pieces or splinters; avoid using sand, it is too heavy. Hang the stuffed bag from a cross-brace in your garage, from a tree, or from any heavy, strong support.

Use the bag for practice of fully released kicks and hand blows, using a variety of types of blows and practicing with left and right hands and feet.

The aim of this type of training is not so much to develop power as to allow you to realize how much power you do have and to allow you to experience the feel of hitting at a fairly solid object.

Padded Surfaces for Fully Released Hand Blows; Found Areas for Kicking

If you do not wish to improvise a striking bag for hand and foot blows, you can merely use towel padding on a tabletop for practice of hand blows (though this does not allow the range of variety in practice), or construct a padded object using a heavy building block as the core. Always fasten the padding (toweling or foam rubber) with tape, never with nails or tacks.

You can practice full power kicks against a telephone pole or solid wall when you are wearing shoes. Just use your judgment to make certain that you are not being offensive or annoying; choose your kicking wall with some sense of other people's rights.

Mat Substitutes

Professional gym mats are very expensive and unless you have institutional mats at your disposal, you are going to have to improvise. As noted below in the section on Throwing Practice Safety, there are certain natural surfaces which can be used when the weather allows. A good mat substitute is the felt padding used under rugs. Several layers of this padding make a moderately good mat when covered with canvas. Another substitute is a layer of wood shavings, also covered with canvas. Unless you intend to operate a professional school, you can get along with a mat substitute.

WHITE RANK — PRELIMINARY
(Beginner — One Stripe)

Student is designated White Rank when he begins to train and is privileged to wear one stripe after he has passed the test for preliminary work as outlined below.

Balance

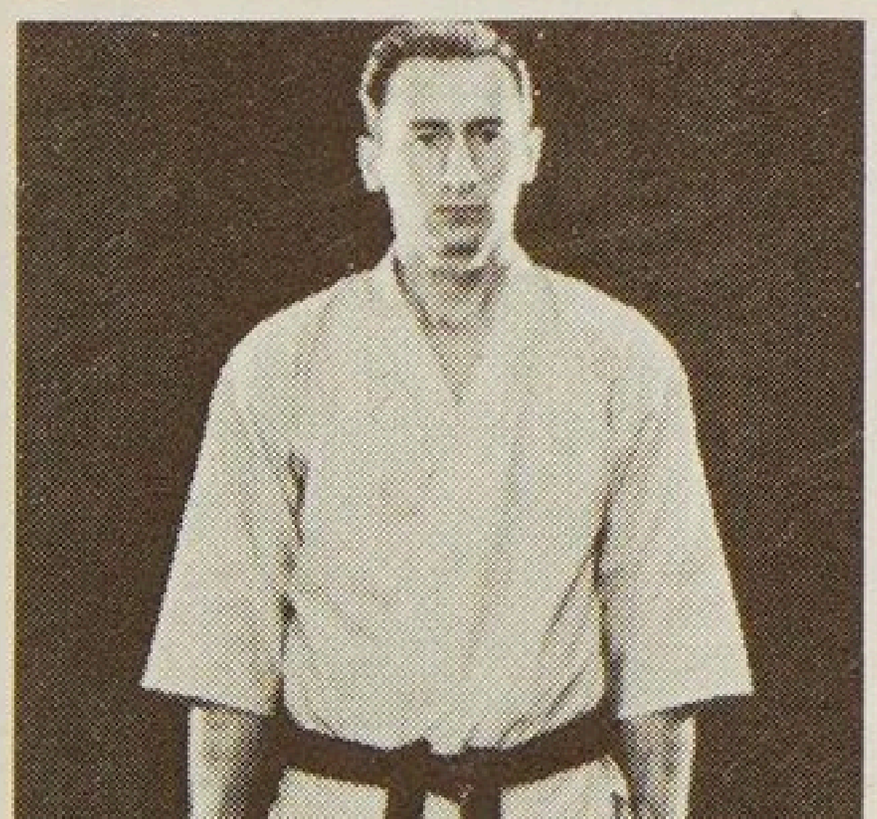
Knowing how to keep your body in strong balance, and how to take advantage of your opponent in weak balance is essential for proper use of many of the techniques of jukado. A technique which might be difficult or impossible to apply when your opponent is firmly balanced, will be easy if you recognize the perfect time for trying the same technique: when he is in weakest balance.

Natural Stance

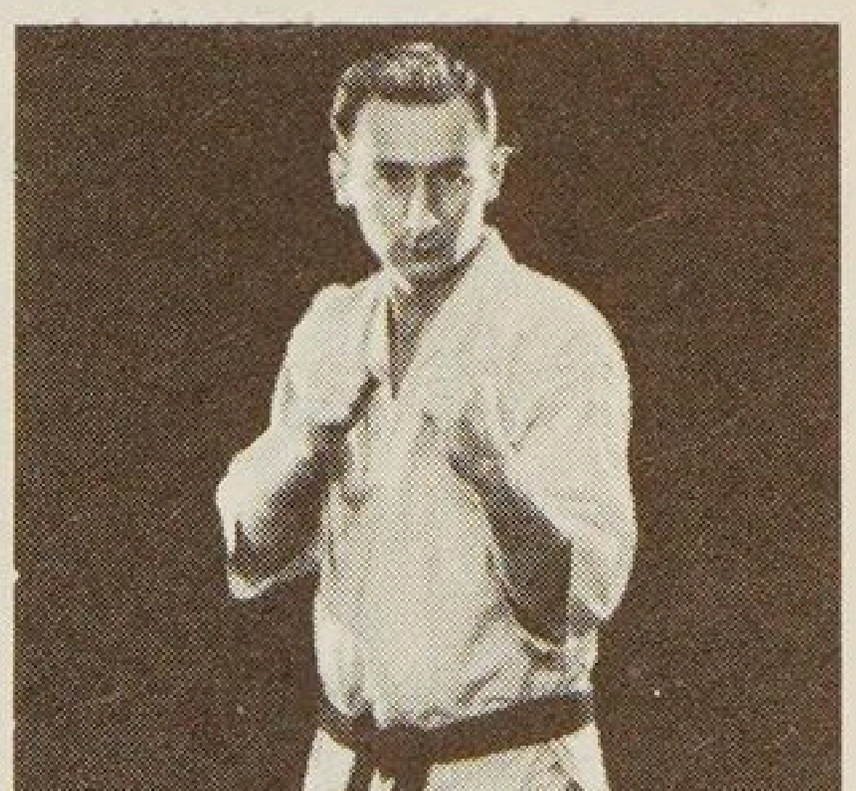
11. In a normal, relaxed standing position, as shown, you are strongly balanced from side to side, that is, you can resist a push from either side. But, in this position, you are very weak from front to back; you can easily be pulled forward or pushed backward. Since you will not spend the rest of your life anticipating attack wherever you go, you might find yourself in this stance when confronted by an attacking adversary. Part of your training should be how to move quickly into a stronger balance even when you make no other preparation to fight. If you slide into a T-position while you are determining whether or not it is possible to avoid fighting, you are not making an obviously aggressive move, yet are better prepared, if necessary, to carry on in the event you are forced to defend yourself. There are some situations in which there is no time to make a move other than a quick defense. It should be clear, therefore, that you ought to learn to defend yourself from your weakest balance as well as practice getting into strong balance when you can.

Boxing Stance

12. The conventional boxing stance is much stronger than a normal stance, but there is still little resistance to a push at the chest; only the direction of weakness has shifted 90°. The advantage of taking a boxing stance is the very fact of its conventionality; from this stance, a conventional type of defense is expected by your adversary. An unconventional, unexpected type of defense will then come as a surprise.



11

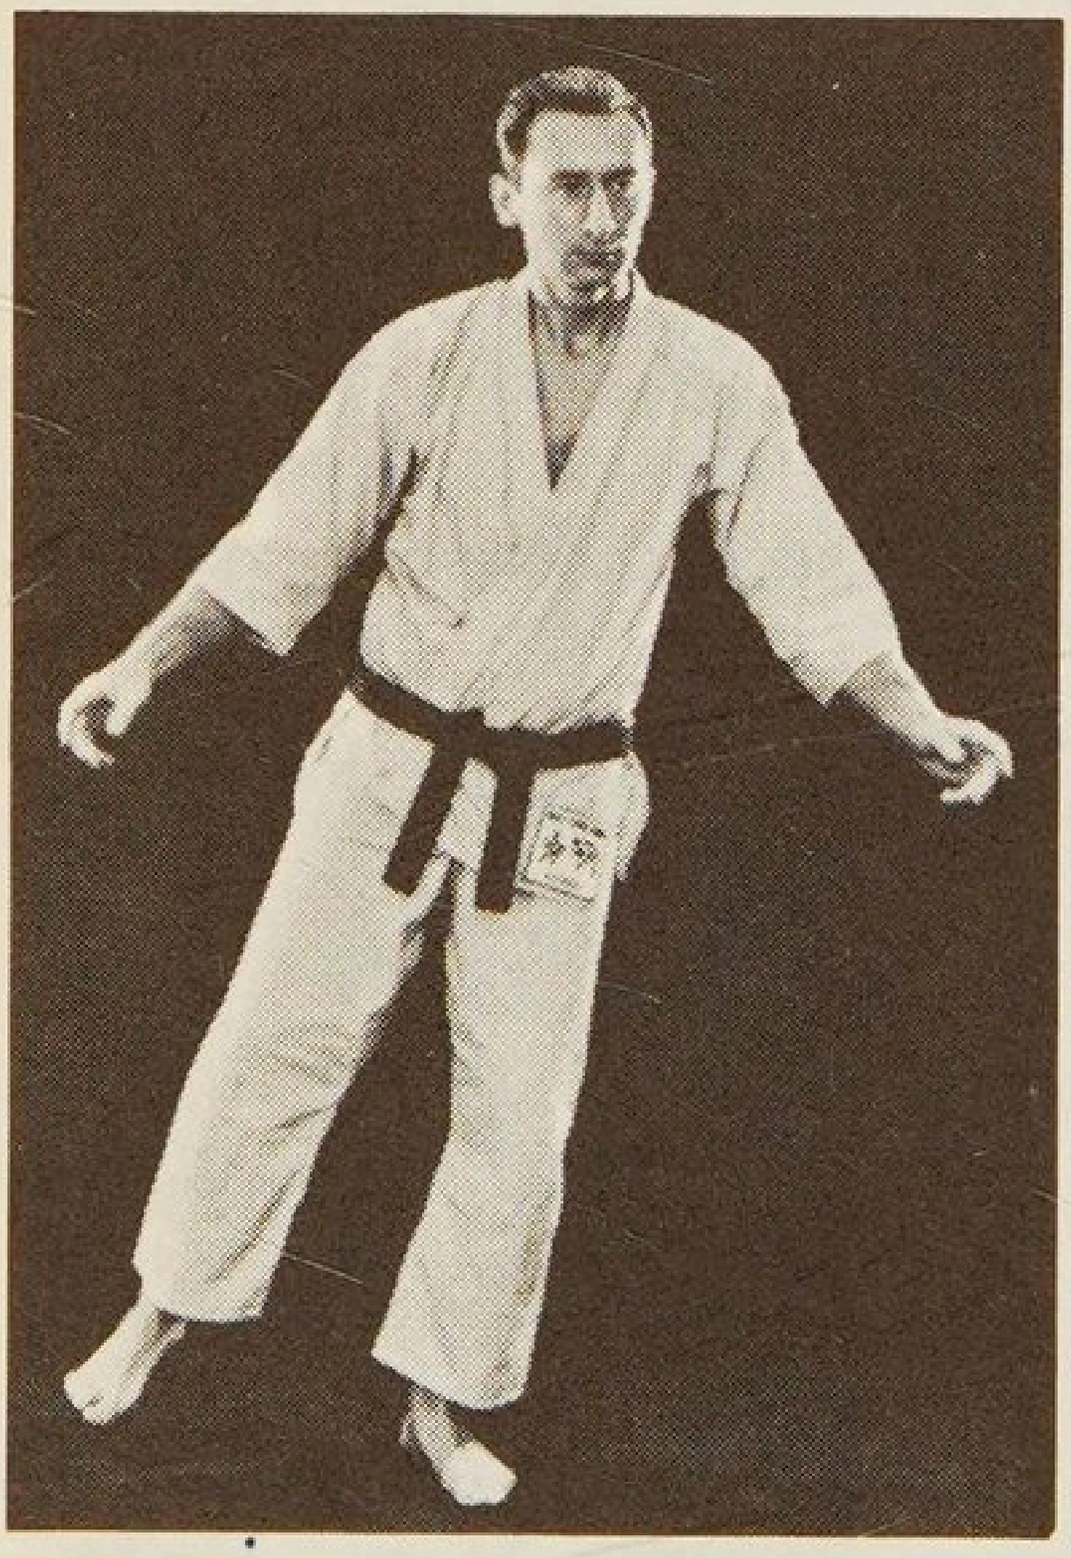


12

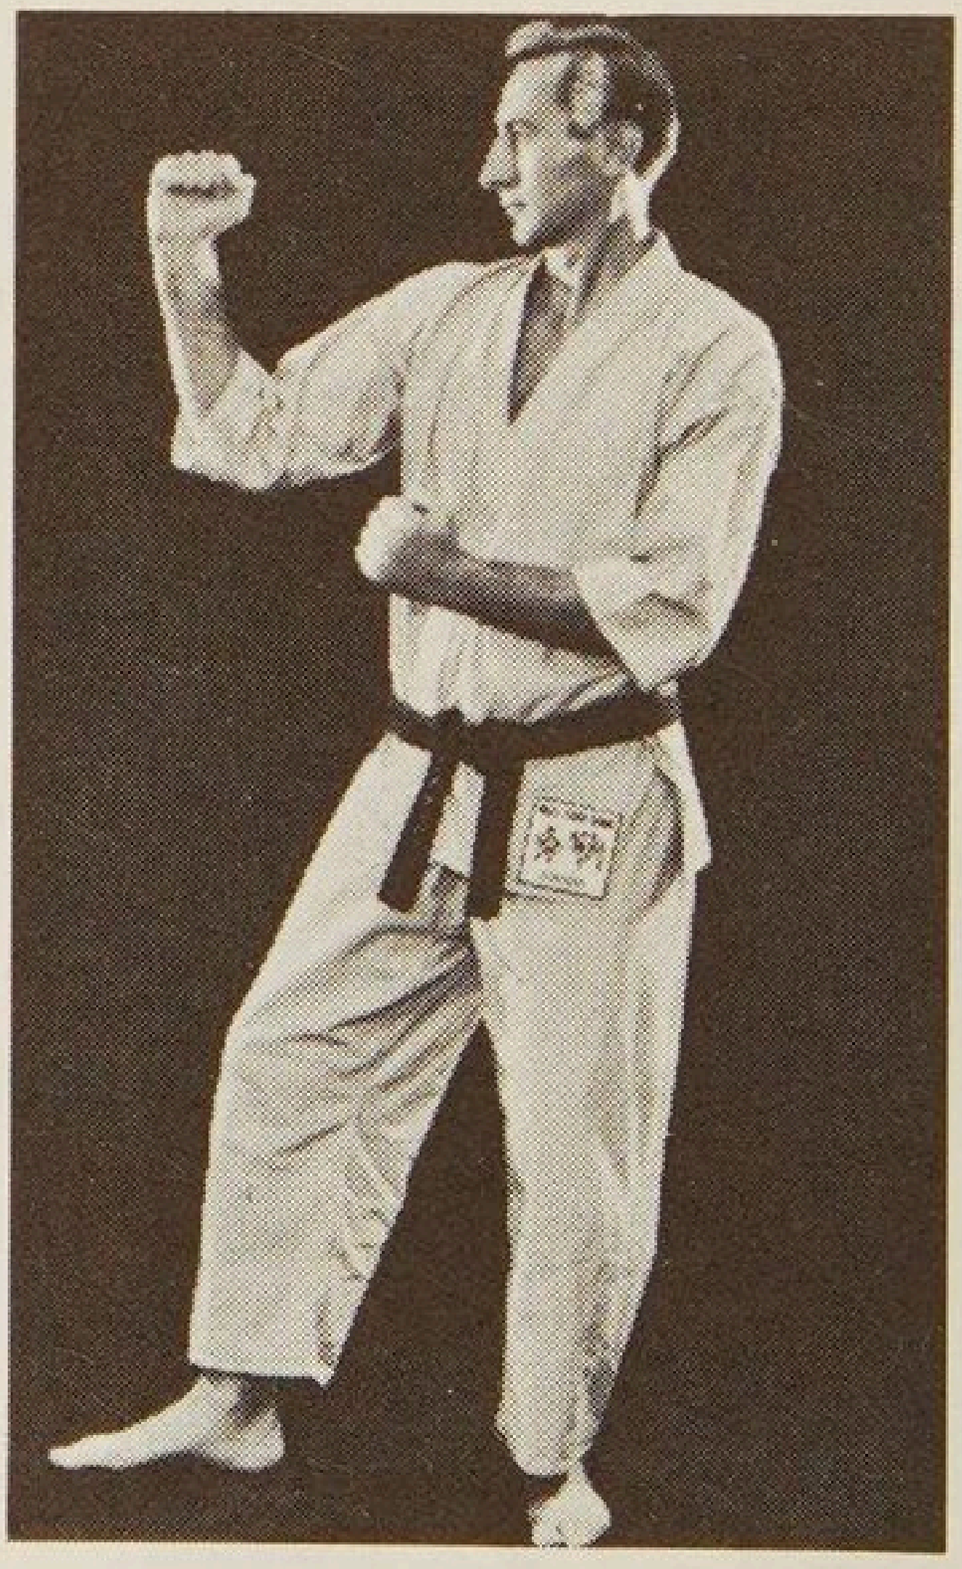
One-Point Balance

13. When we stand on one foot, we are weak in all directions; a push or pull from or to any direction is difficult to resist. It is in this position that any technique is most likely to be successful and some techniques (as will be noted when this applies) will not work at all unless your opponent is on one-point balance. There are three circumstances which put your opponent in his weakest balance. Every time he takes a step, there is a period when he is on one point. The other two circumstances are planned. By tilting and pulling, you can place your opponent on one-point before applying the technique. With practice, this can be done easily. Finally, a feinting or faking action on your part can make your opponent react and move into one-point balance. If you want him to move forward, a fake retreat will draw him in your direction; and if you want him to move backward onto one foot a fake attack forward could work.

13



14



T-Position

14. The strongest balance of which we are capable is the T-stance. The name derives from the relative position of the feet. In the photo, it is the right foot which is forward; if that foot were drawn back to touch the left foot, the two feet would form a "T." Feet are about shoulder width apart; the forward foot points in front of you; the rear foot is held at a 90° angle to the forward foot. Your body will naturally shift to about 45° from front, but your head is turned directly to the front. In this position you are

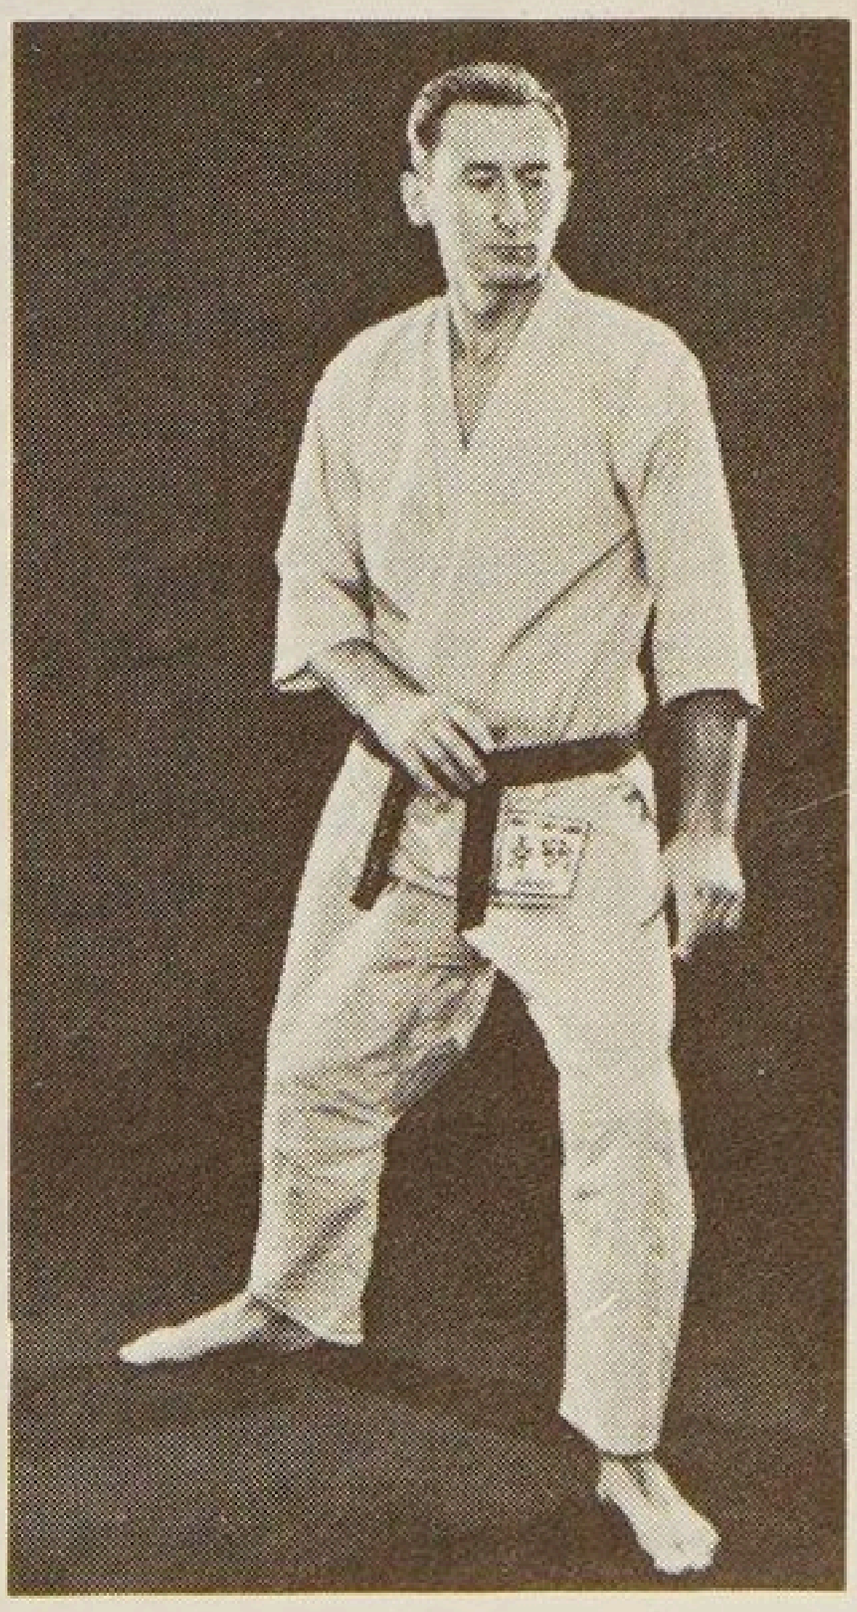
least vulnerable to being pushed, pulled, or knocked down; your body offers less target than when you face full front; you can shift your weight easily in all directions. It is a strong, flexible stance and does not require unreasonable practice time to become accustomed to using it. Generally, it is best to have your weight distributed equally on both feet. For kicking, however, the T-position allows you to shift your weight to either foot without shifting of body position and without giving away your intended kicking action. There are many other stances favored by various teachers of different styles of Oriental fighting. For practical self-defense, this is my choice as the best, all-around stance.

Slide-Stepping

The ability to move easily and quickly from position to position is useful for self-defense and essential for contest. You must learn to be in the right position to deliver offensive tactics and you must learn to get out of the way in order to use evasive tactics. Better than ordinary walking action for jukado, slide-stepping permits you to change your position with the least loss of strong balance; during the sliding-stepping action you do not get into one-point balance at any time. Not only will the practice be useful to you now while you are actively practicing jukado but it will, with moderate practice, change your mode of movement so that a more smooth, graceful, effortless style of body movement becomes normal for you, enhancing your appearance and your efficiency.

15, 16. From a T-position, slide your rear foot back, keeping the ball of your foot on the ground.

15

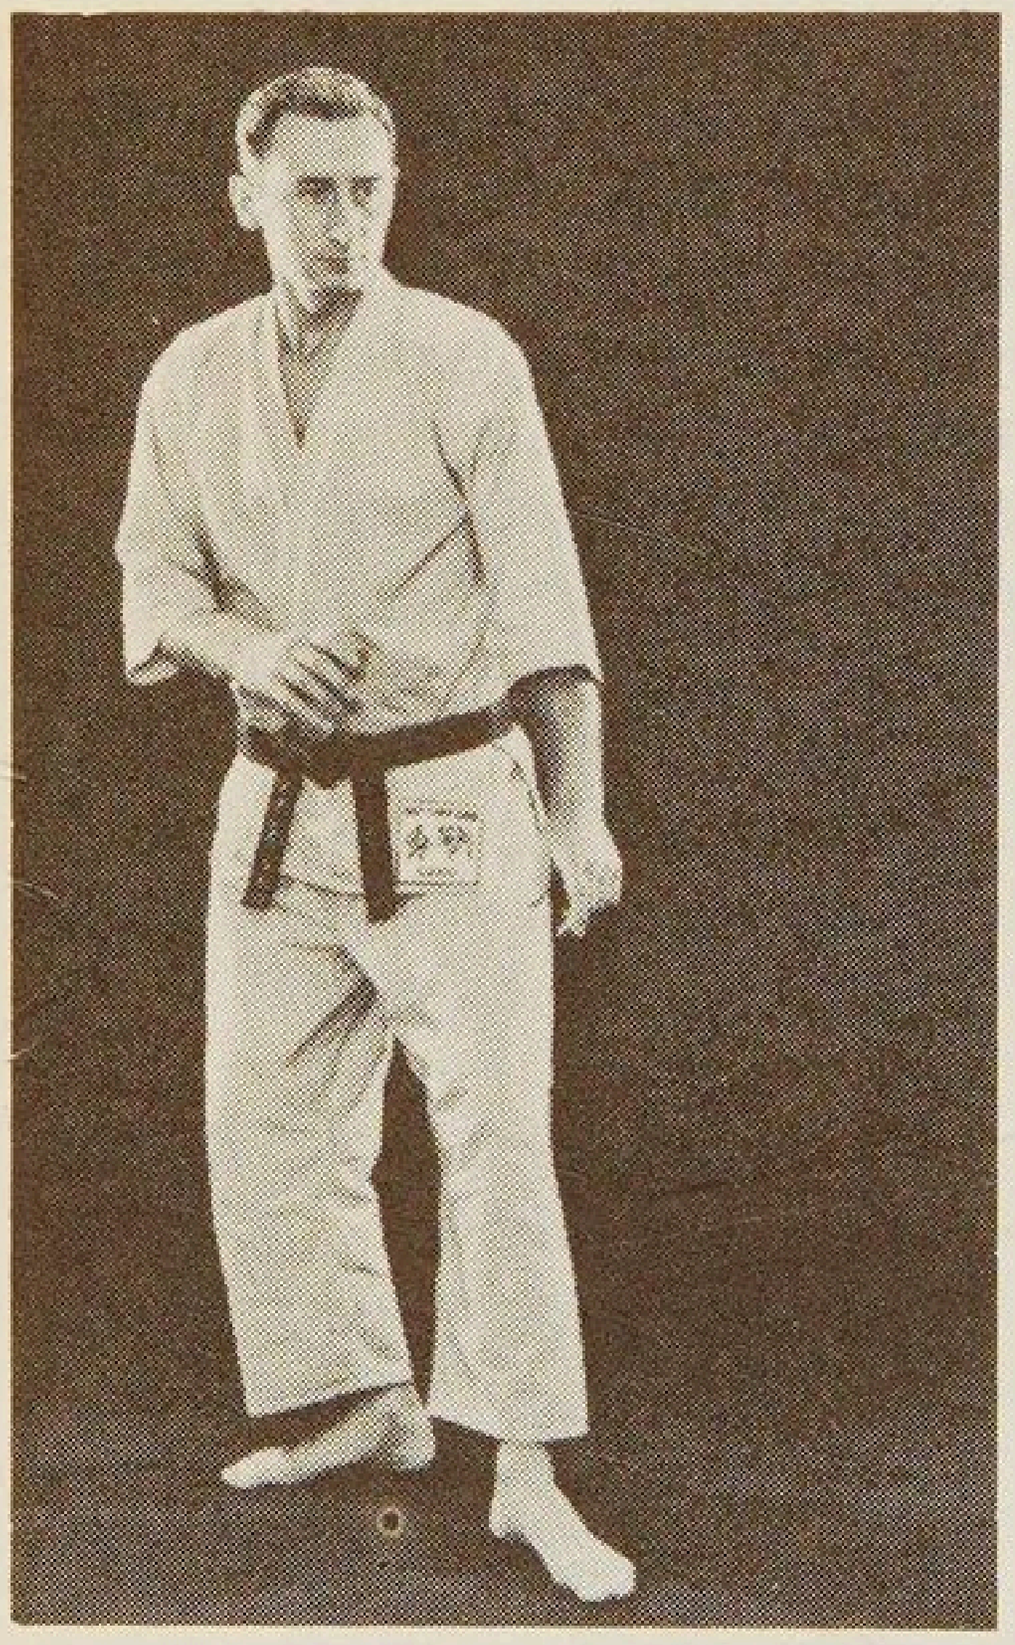


16

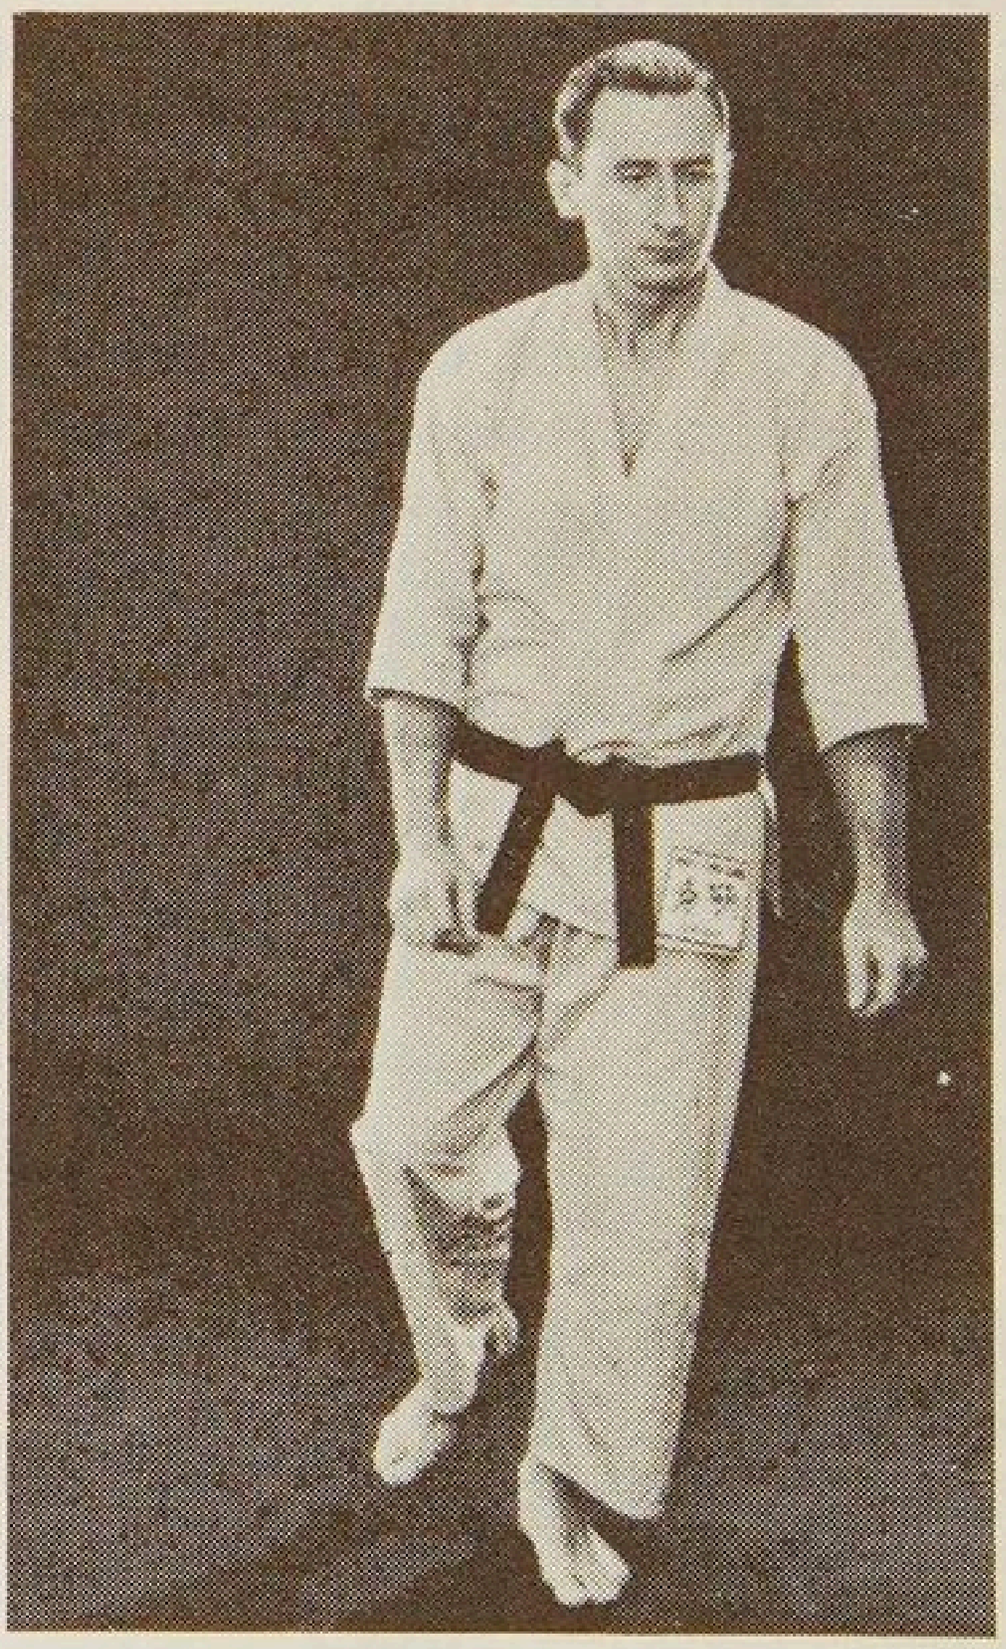
17. Draw the forward foot back to the rear foot, keeping the ball of your foot on the ground.

Practice these from rear to front, from side to side, in all directions, until you can swiftly and smoothly change your position without completely lifting either foot from the ground. There should be no unnecessary body movement during slide-stepping practice. If you practice as though you had a glass of water balanced on your head, it will assist the proper control, or, you can actually balance a book on your head as you practice until you get the feel of the correct method.

17



18



Leaping

Like slide-stepping, practice of leaping is useful for swift movement out of range of an attack without loss of balance.

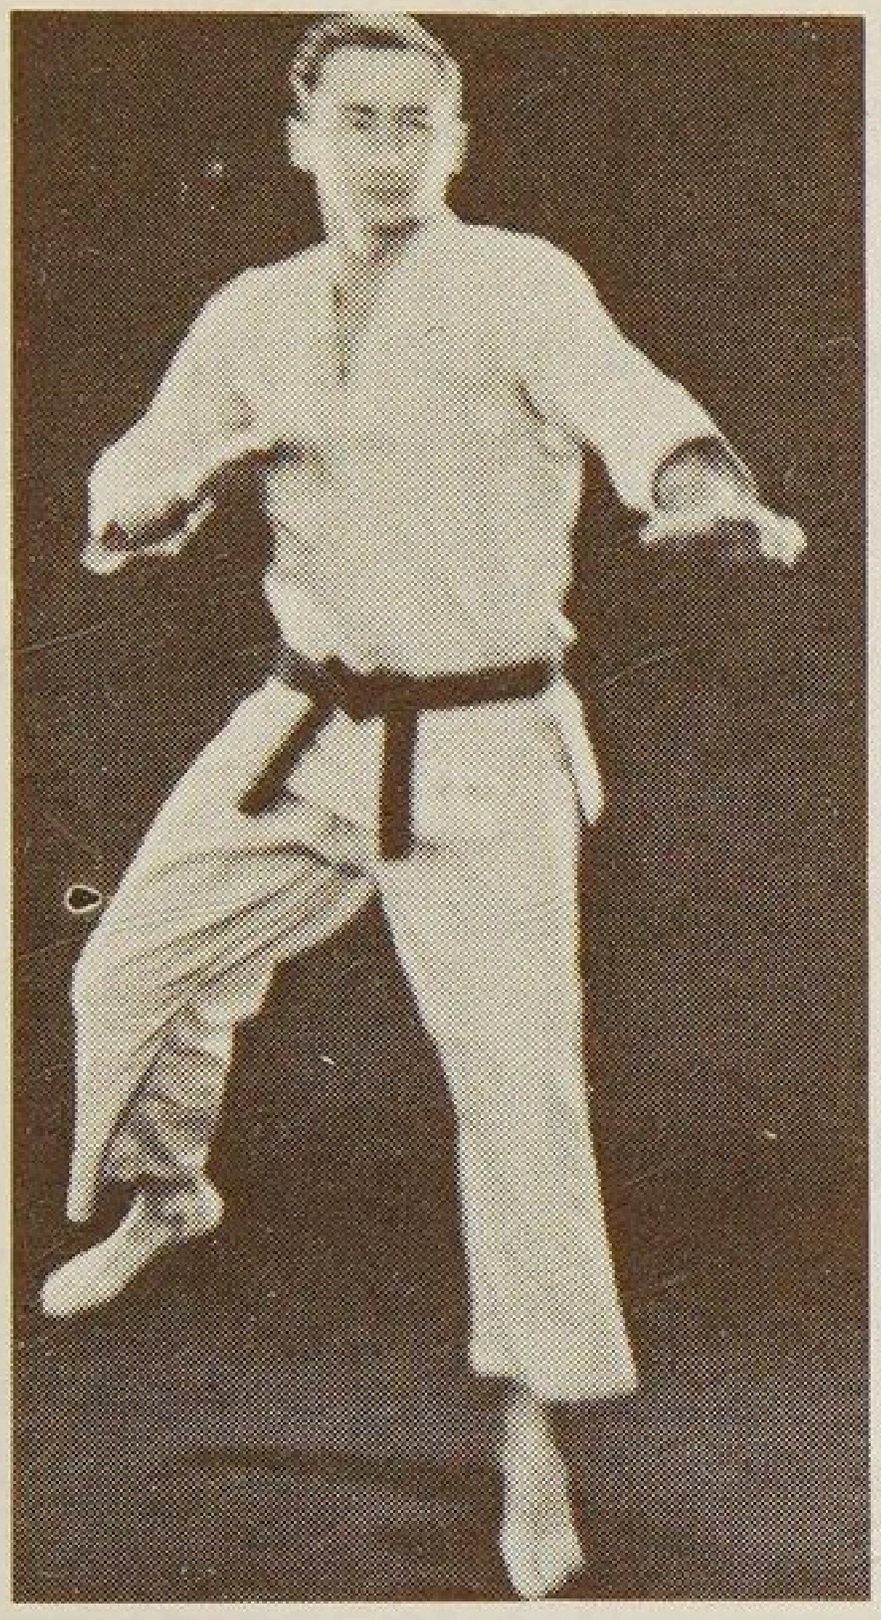
18. Backward leaping: From a T-position, shift your weight to the ball of the forward foot; draw your rear foot up.

19. Push off from the ball of the forward foot, leap back as far as you can.

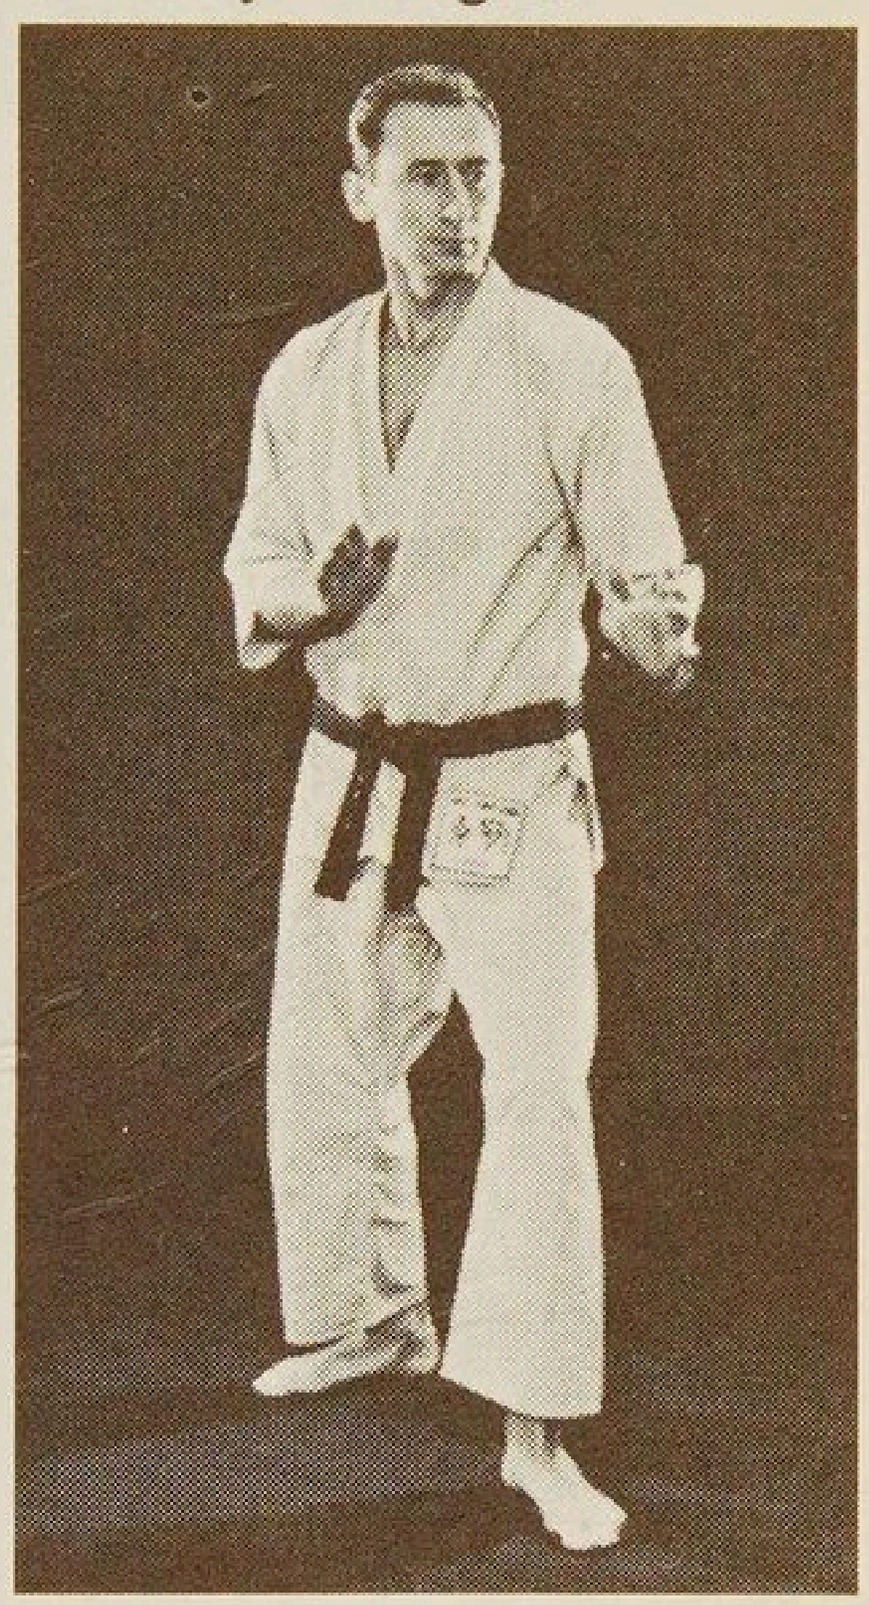
20. Practice ending in a T-position.

From 20, shift your weight onto the ball of the rear foot and raise your forward foot. To leap, push off from the ball of the rear foot.

Practice leaping forward and backward, as well as from side to side. Practice from a natural stance as well, but be certain that you end in a T-stance, no matter from what stance you begin.



19



20

FIGHTING STANCES

The classic fighting stances of karate are primarily useful for contest and for free-style practice; as self-defense tactics they are often neither practical nor possible. When you assume a karate fighting stance, you announce your intention of fighting and by so doing you lose the chance of trying to avoid a street fight. The fighting stances imply belligerence and make you seem the aggressor even when you are in a situation which you have not created and even though you may prefer not to fight. It is a psychological disadvantage to take on the role of the aggressor. Because you may not always have the time or opportunity to assume a fighting stance, practical and useful self-defense training must be based on the assumption that you can effectively defend from a natural stance, from a seated position, or even from the ground. Finally, there are a number of fairly common attacks which, if applied, do not allow you to assume a fighting stance: back-attacks and wrestling-type attacks are examples.

It is typical of TV and movie fight scenes to have the karate fighter take a stylish and showy stance as part of the action; it always works on the screen for the simple reason that the hero has his victory written into the script and the villain is paid to lose. Real life is considerably different; don't let film fantasy make you lose your sense of judgment.

Of the various fighting stances which are useful for sport, excellent for free-style practice, and sometimes useful in self-defense, five are shown here. There are literally hundreds of possible fighting stances which could be taught — variations of these and other hand and foot positions. These are examples of only a few of the possibilities:

21. Feet are in T-position; both hands in open, slashing position.

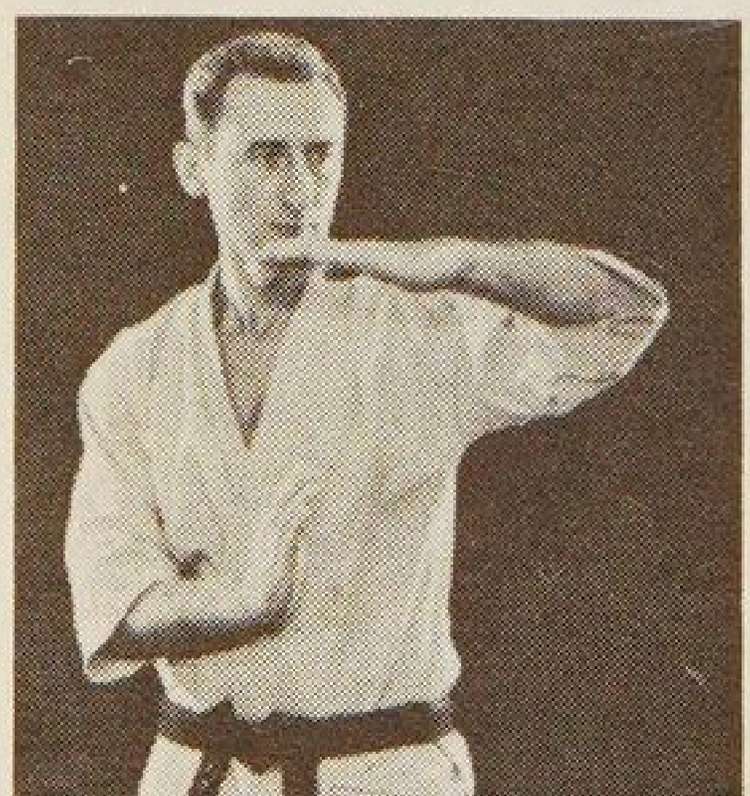
22. Feet in T-position; both hands in fist position.

23. Feet in T-position; one hand in very high defensive position, the other hand very low.

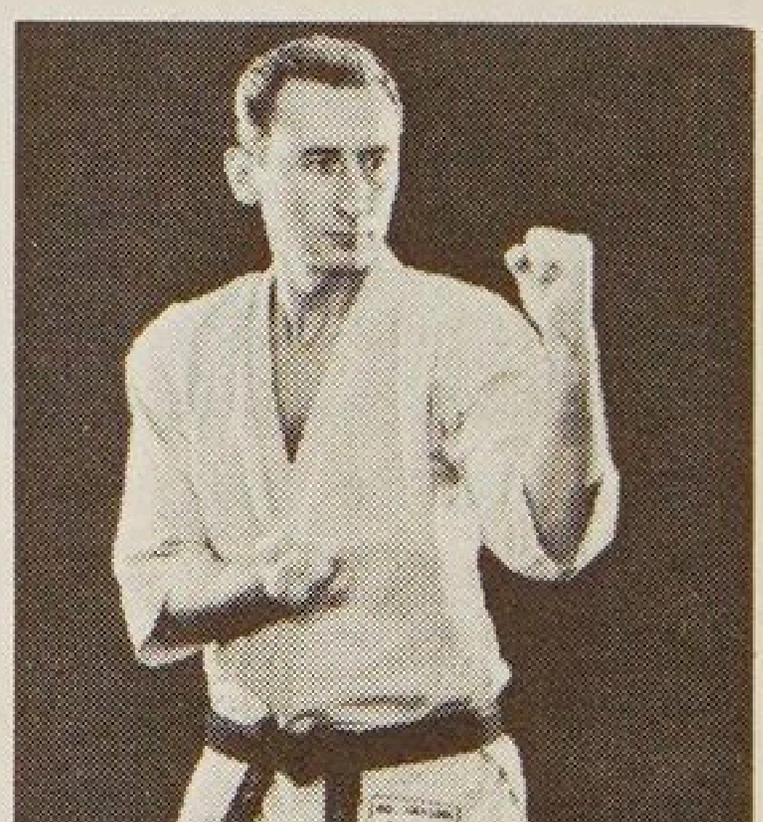
24. Feet in modified T-position (halfway between T and boxer stance); lead arm held horizontal.

25. Feet are in T-stance; lead hand held vertical.

It should be immediately apparent that variations of the above five stances are almost endless; the hand positions in any case could be reversed; where there is a slash shown, a fist could be substituted; the exact height of the guarding hand can vary; the foot positions can be varied; lead hand and foot can be alternated; and different hand positions can be used as desired. The fighting stance *you* take will depend on several factors: The primary factor is the way in which you feel most comfortable and effective. What is a

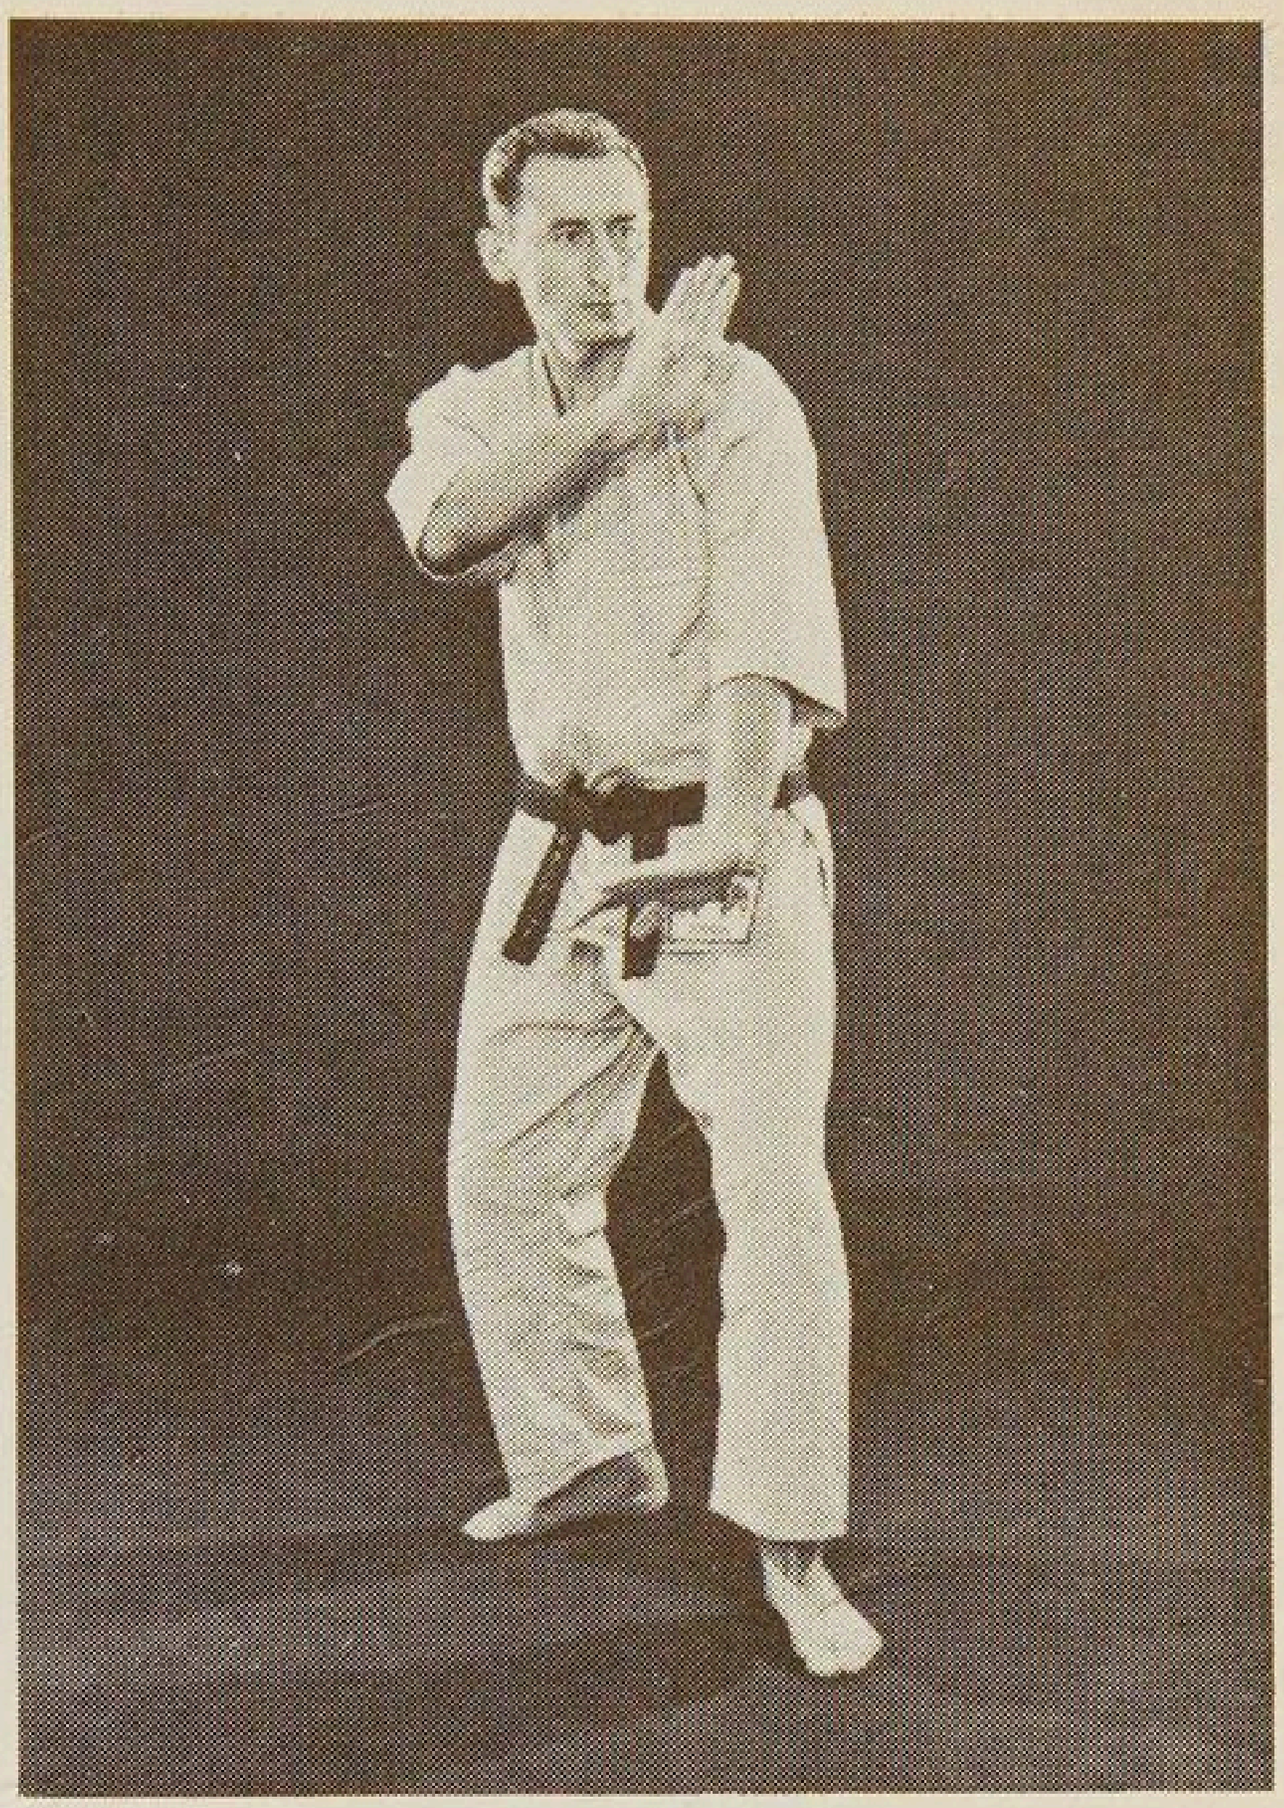


21



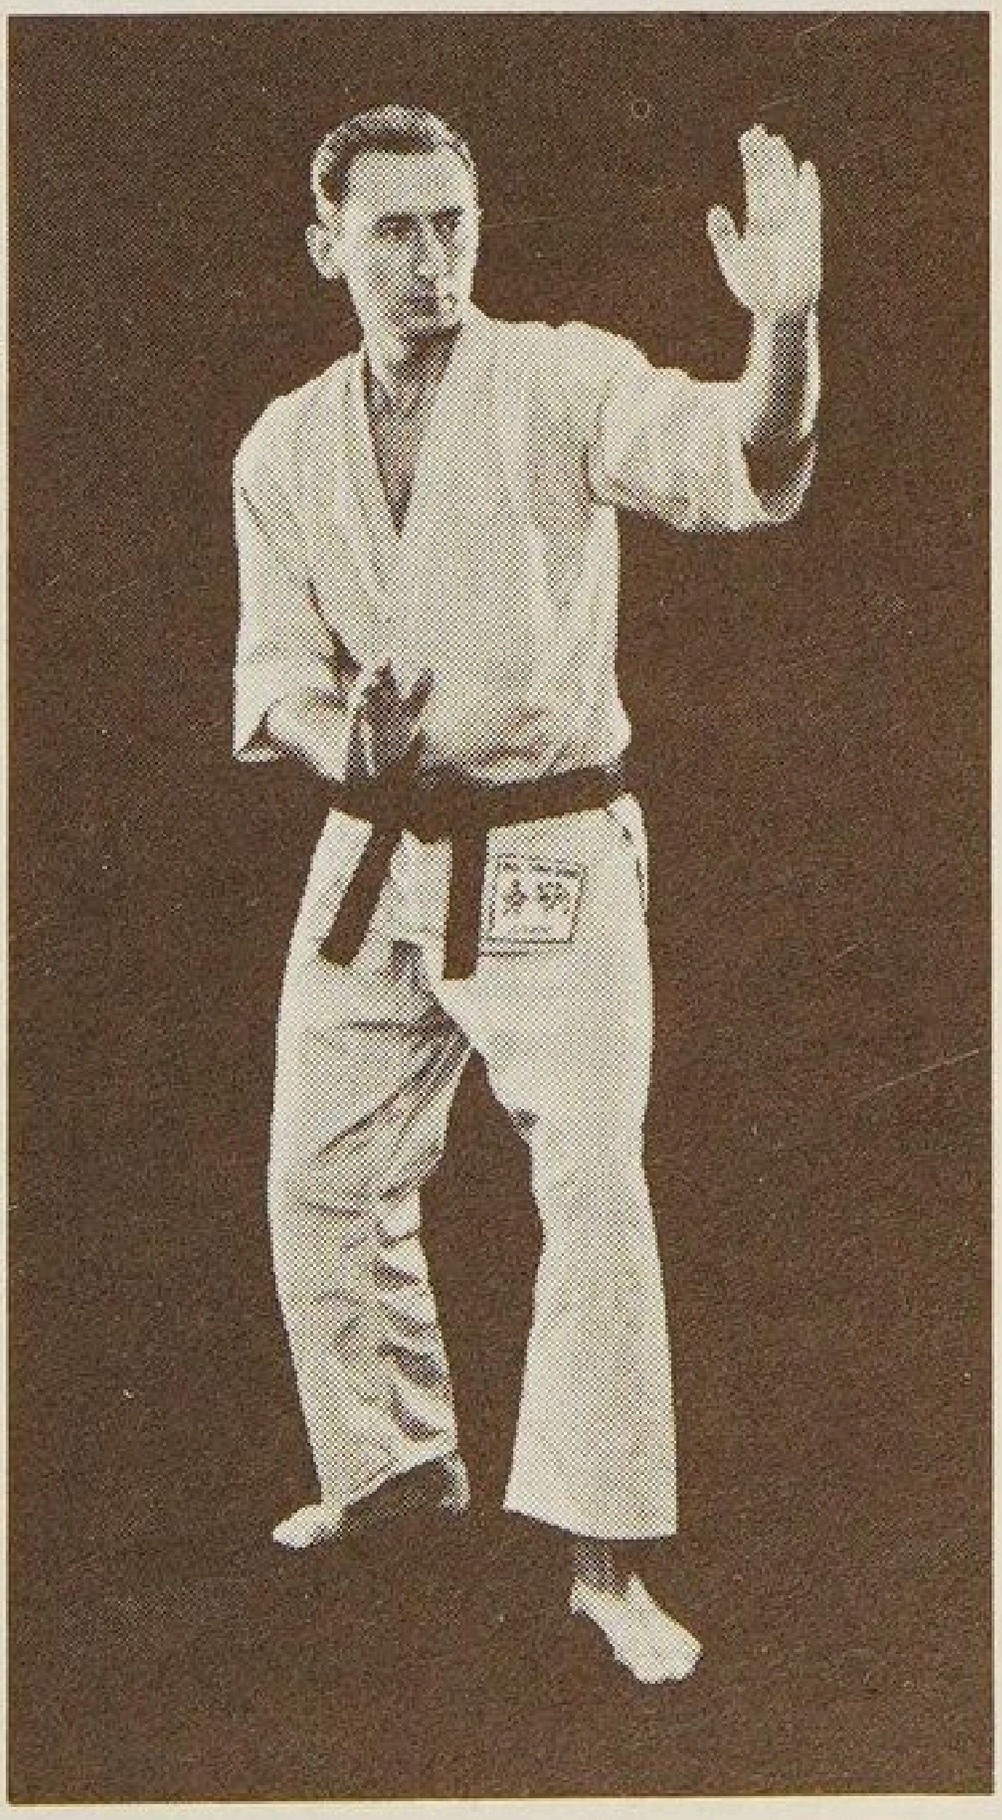
22

23



24

25



splendid fighting stance for one person might feel very awkward for another. The second factor, which is a constantly shifting condition, is the type of attack being made. In order to deal effectively with different types of attacks, you must allow your stances to vary as the attack varies. If you allow yourself to get trapped into the false idea of "best" stance, your defense will be rigid and unflexible. If, for example, you are to deal effectively with an adversary who specializes in low kicks as street fighters do, it is perfectly obvious that you must assume a low guard. If you are to deal effectively with a person who attacks primarily in a boxing style, low guards are unnecessary.

Karate fighting stances were evolved for karate contests in which all point blows are delivered above the belt. Unlike karate, sparring in jukado requires the ability to deal with attacks ranging the full length of the body to simulate street-fighting situations.

It is my experience that the T-position or the modified boxer stance is preferred by most people. I do not insist on it, as I place a high value on versatility and on individuality of style, but it has proven most practical of all the foot positions. In addition to giving strong balance, it allows very free use of foot blows, evasive tactics, and quick movement. For this reason, it is more useful in self-defense than, for instance, the horse stance, which gives very strong balance to the side, but does not allow such free and quick foot movements as the T.

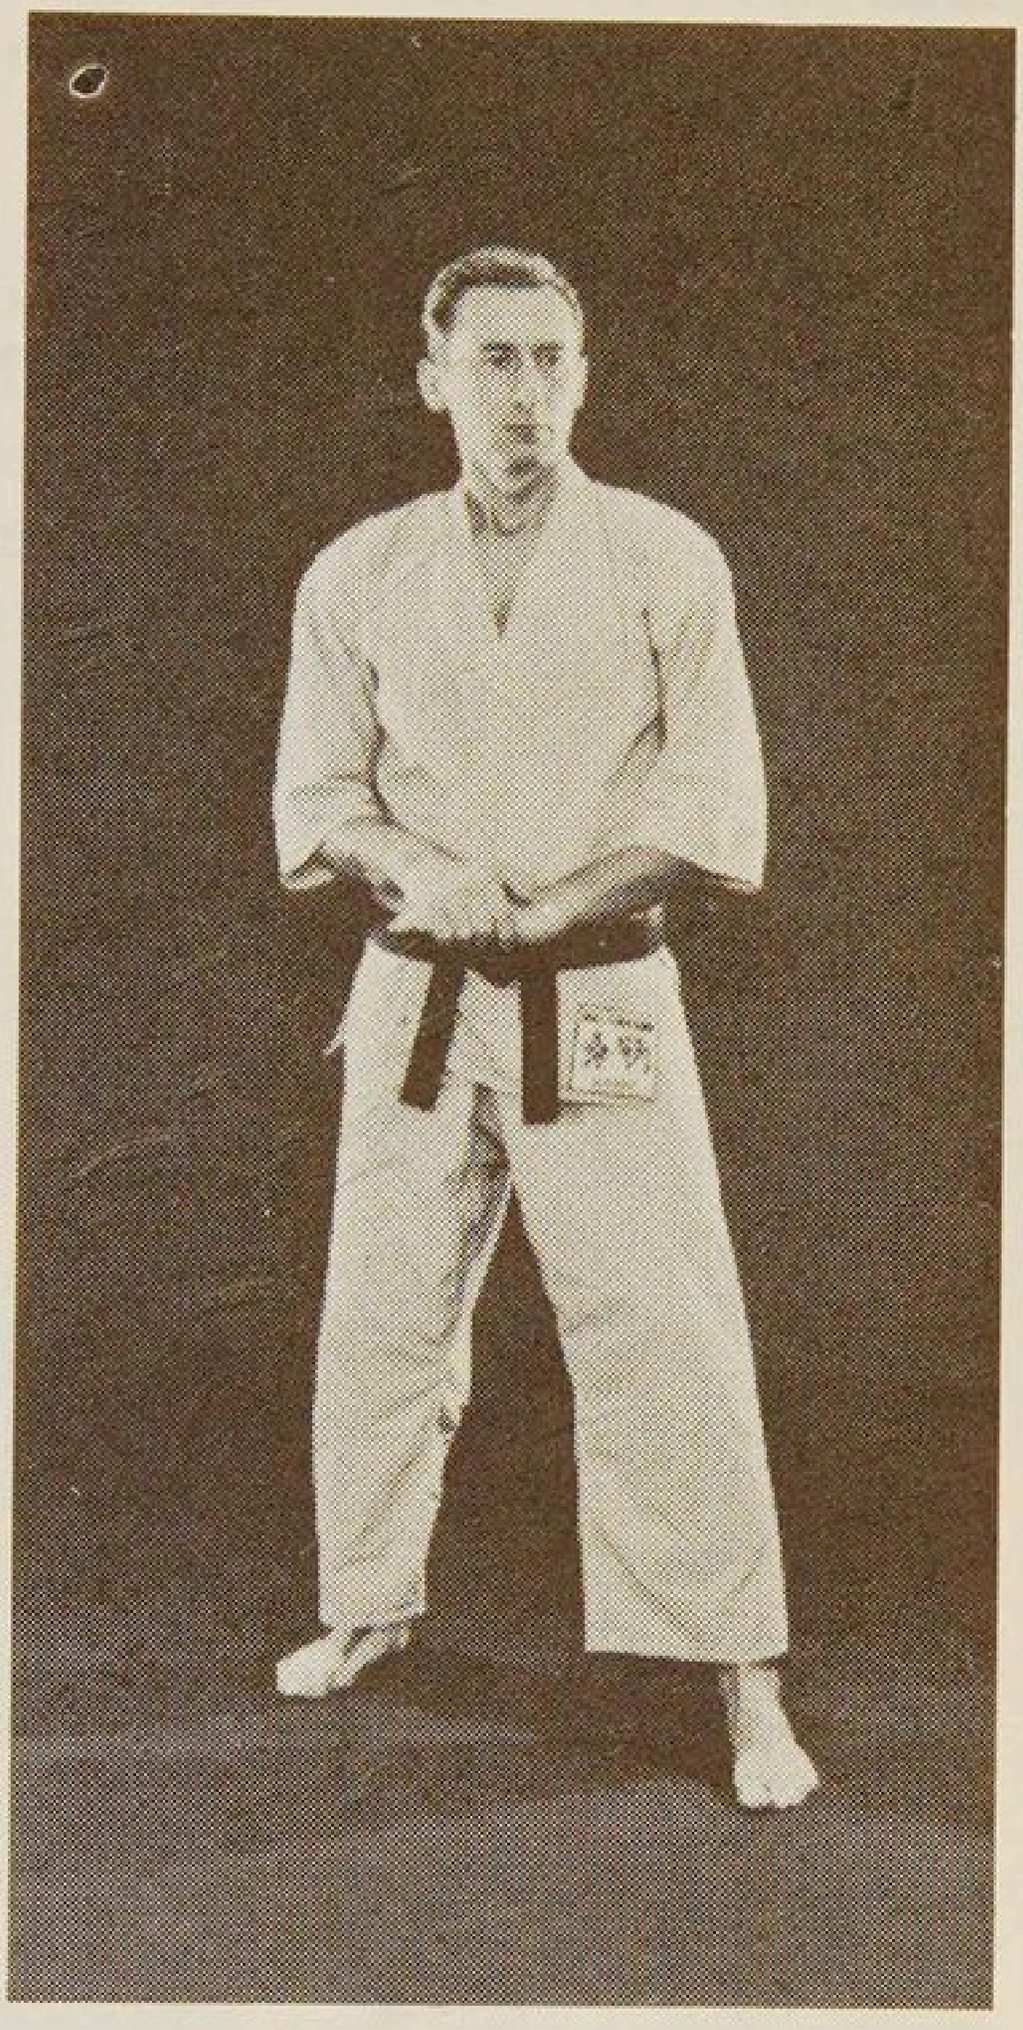
The old-fashioned methods of teaching include exercises in which the student assumes the horse stance, for instance, and holds it from periods of a few minutes to an hour! As disciplinary training it may have value, but this procedure certainly has no place in modern teaching methods. Like a number of other practices in classical training, it is a holdover from feudal times and conditions.

In Photo 26 the horse stance is seen from the side; weight is equally balanced on both feet, knees somewhat bent and the side of the body faces the opponent. The advantage of this stance is that it offers minimum body target area to the adversary and it gives very strong balance to the side. The disadvantage is that it is a rigid stance, allowing limited response to various street-attack situations.

Although the horse stance is a favorite with teachers of several styles of karate, particularly the kung fu style of karate, I much prefer the more versatile, free-moving T-stance for self-defense. Remembering, always, that it is not possible to assume a stance in surprise and back attack situations.

26

27



ON-GUARD STANCES

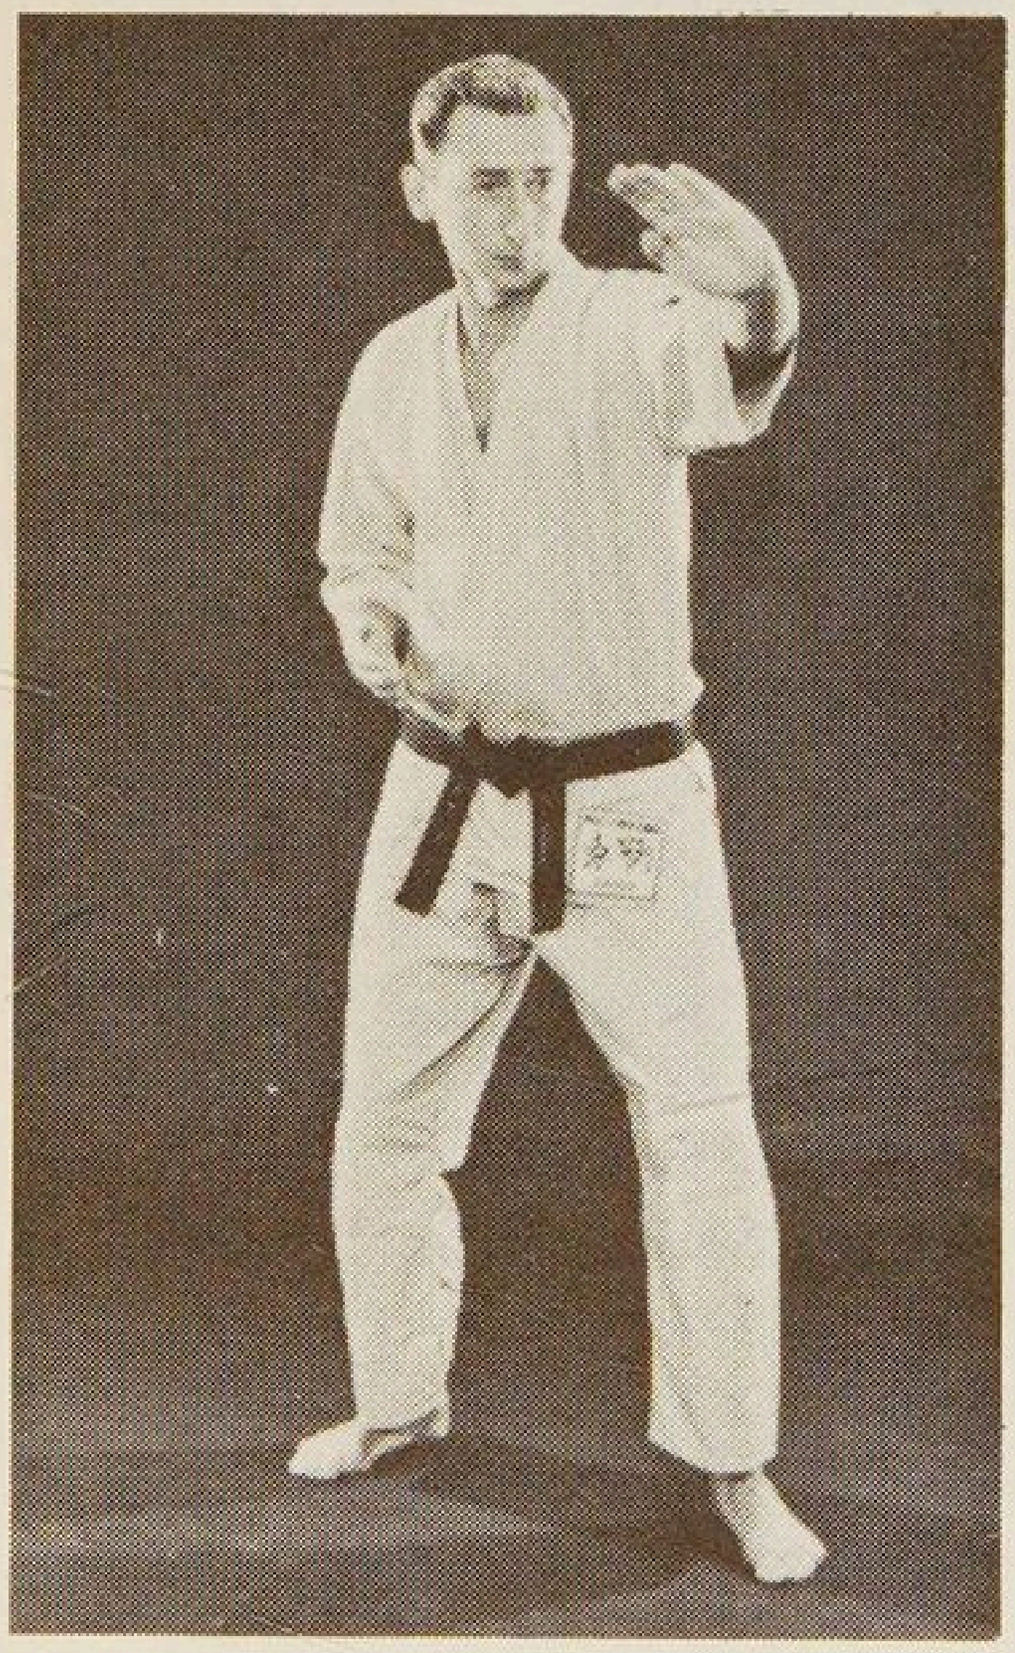
Preparation to defend requires that you be in good balance and that your hands and feet are in position to deliver blows quickly and easily. The on-guard stances shown here give you all the necessary values of fighting stances without showing belligerence. Needless to say, if your adversary has already started an attack or you judge that it is impossible to avoid a fight, you do not have to delay your defense by going into *any* kind of a stance.

27. Feet are in a semi T-position, weight is on the rear foot to allow lead foot to kick, if necessary; hands are held clasped at about waist height with the fingers of the right hand pulling back against the left hand, creating a spring tension.

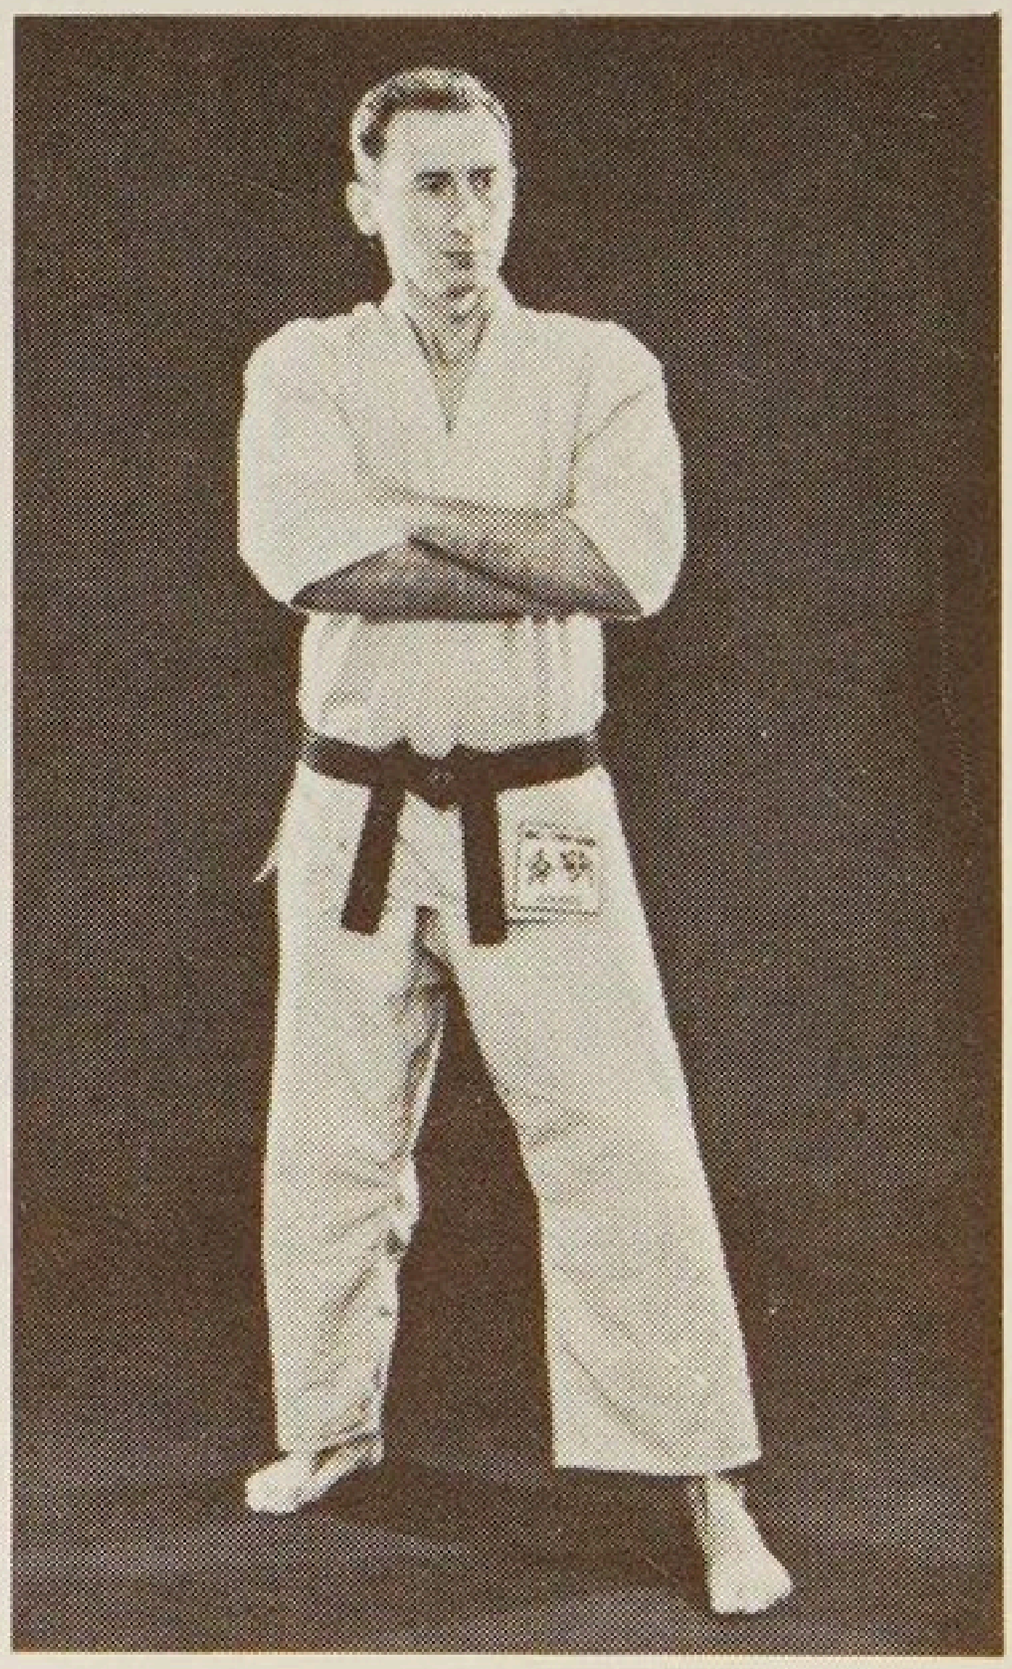
28. At the first sign of action on the part of your adversary, your lead hand can spring forward with added impetus from the spring tension. Of course, you will continue with kicks and hand blows if required.

29. Feet are in semi T-position, arms are folded; hands are made into fists which are hidden in the elbows. The lead arm pushes forward as the other arm pulls back, creating the spring tension. At the first sign of action, you are ready to hit with a fist blow, added impetus is given by the tension. Kicks and hand blows quickly follow this first action, if needed.

28



29

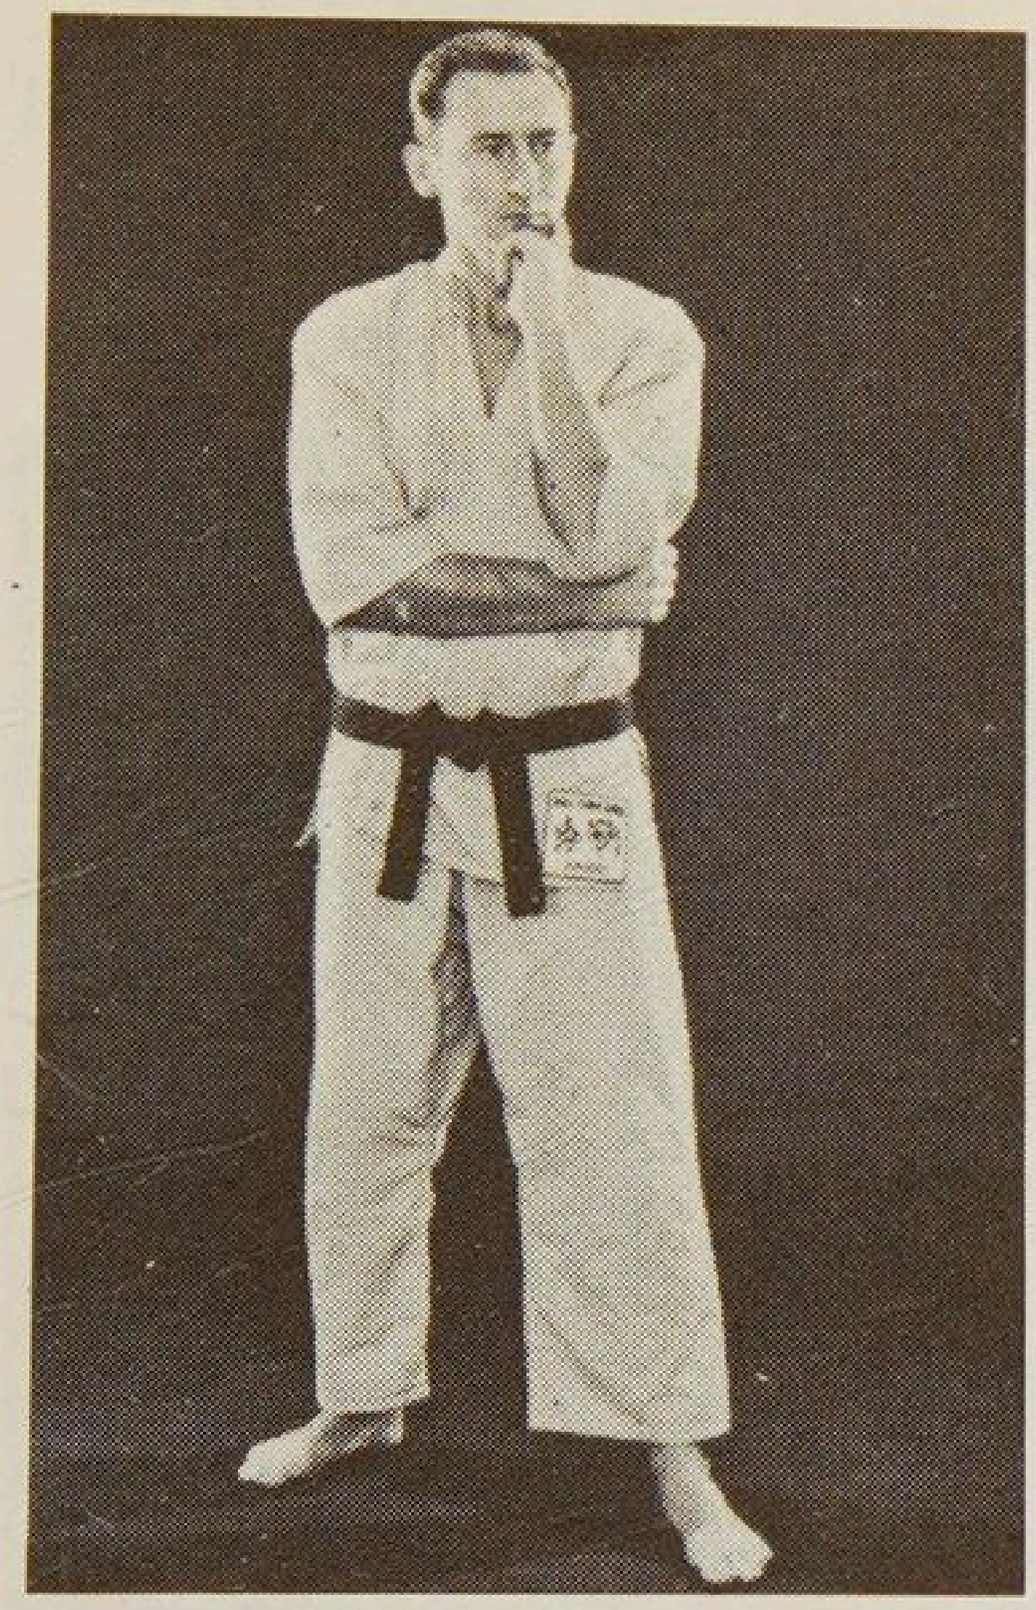


THOUGHTFUL GUARD

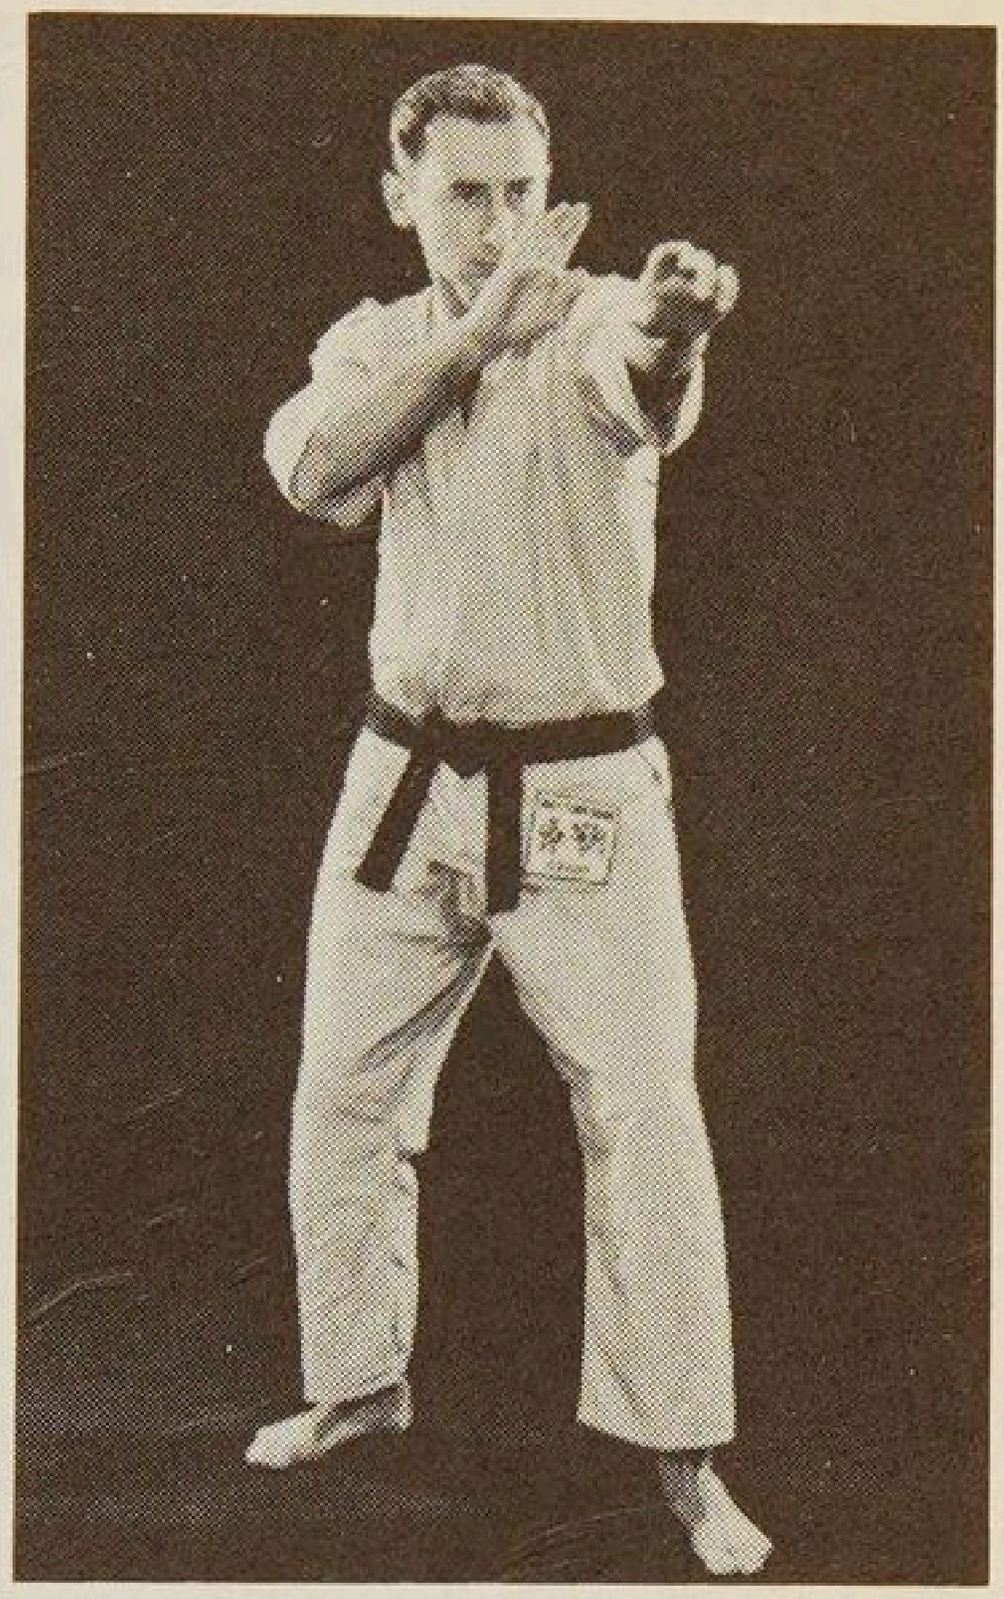
30. The advantage of this on-guard position is that it signals the idea of *thinking* rather than the image of anger or fear. This natural and calm manner does not precipitate a fight, but you are ready to fight if necessary. Your hands held in this position are where you need them if physical action is necessary. (Do not keep your hands in your pockets to give the appearance of nonchalance — you are much too vulnerable.)

31. At the first sign of aggressive movement, your hands are in action. Kicking and additional hand blows must quickly follow the first action, if needed.

30



31



HAND POSITIONS FOR STRIKING

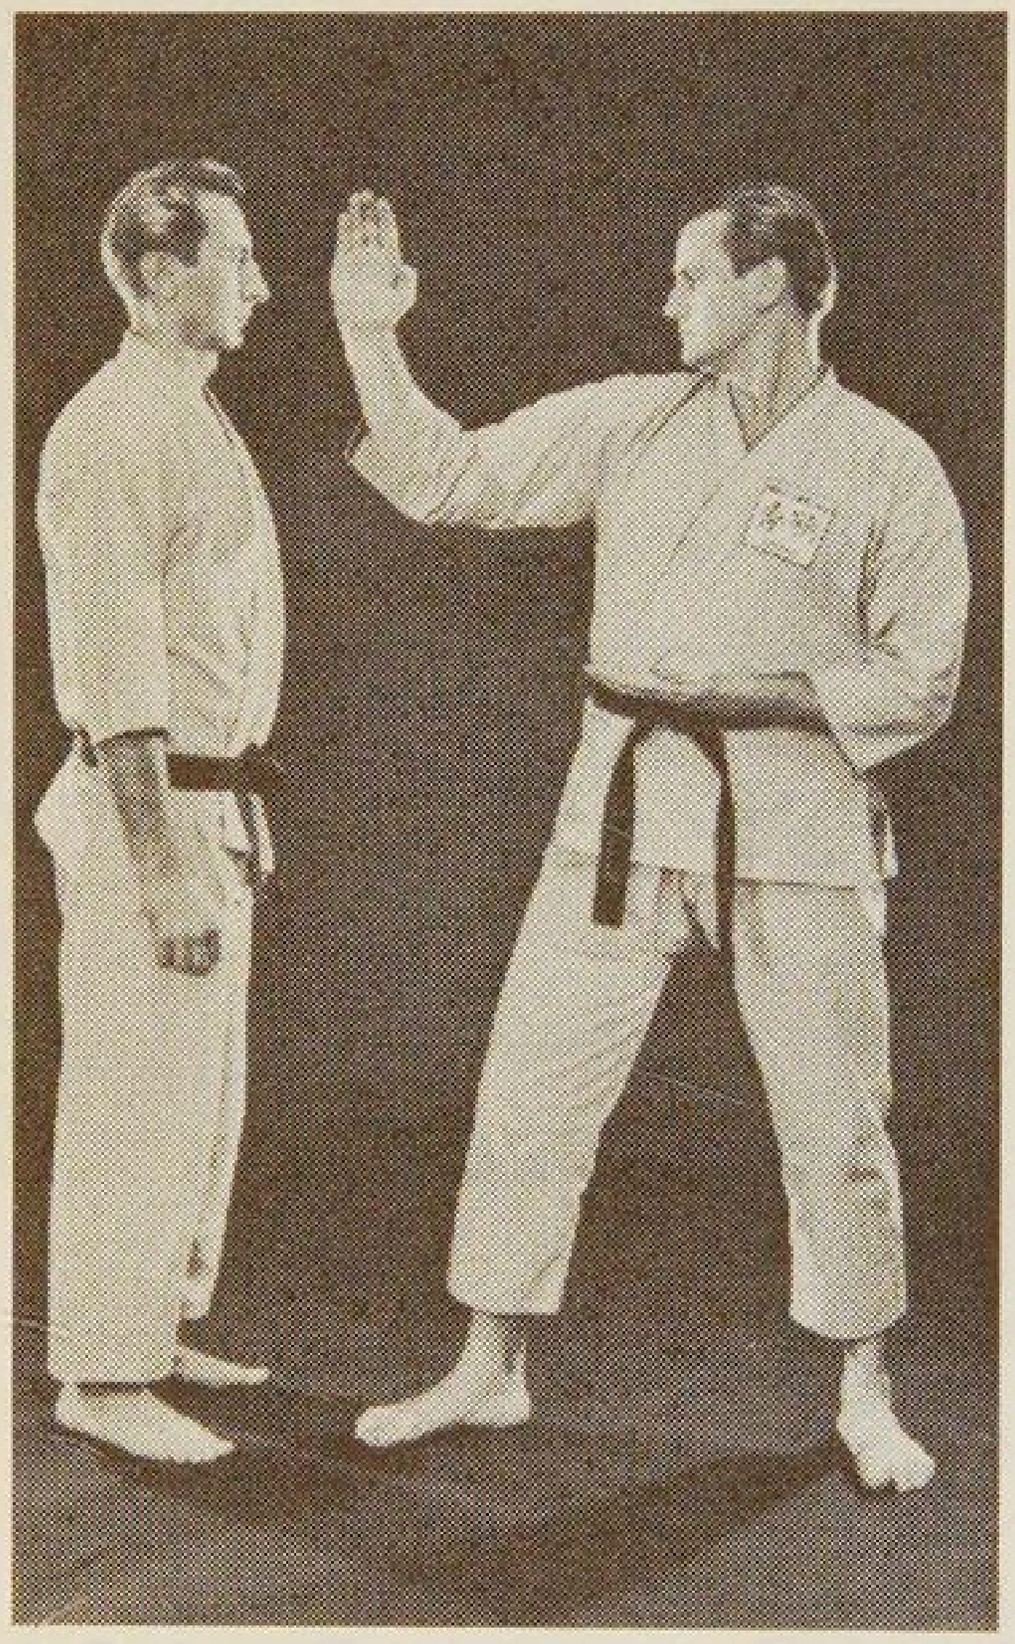
Before you learn how to make the actual hand blows, you must be familiar with the exact part of the hand that is used for the various methods of striking. This is essential if you are to apply the hand blows correctly.

Edge of the Hand

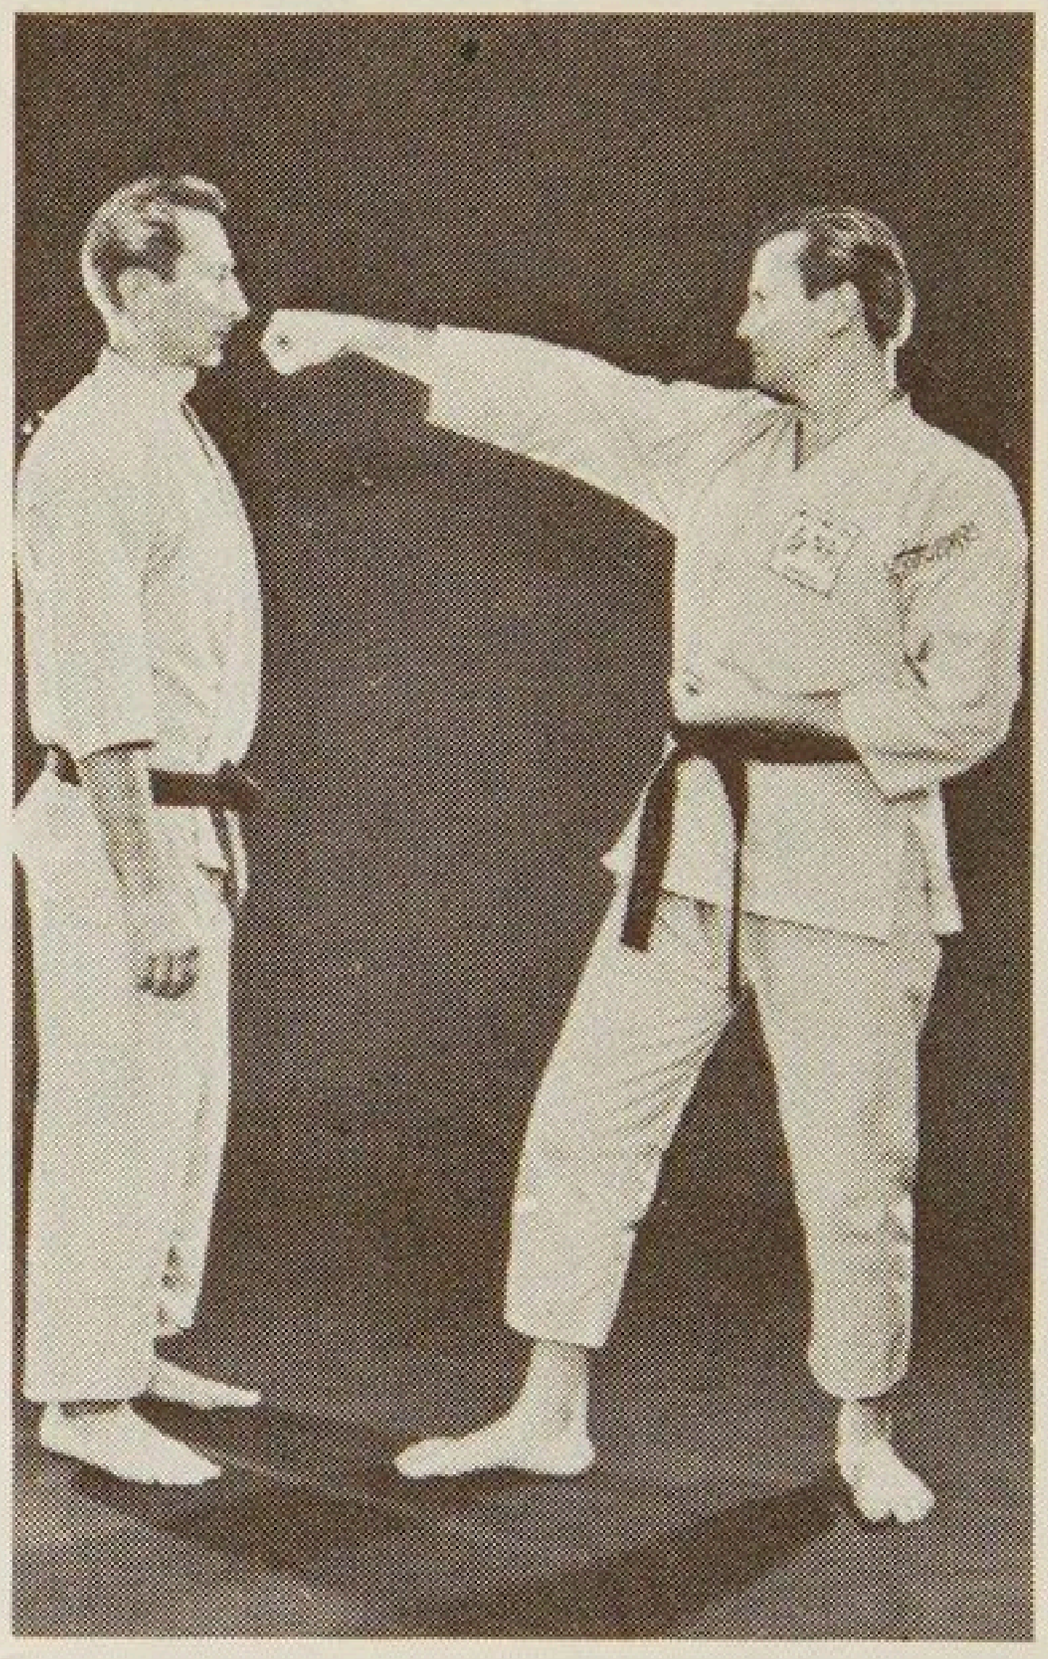
32. The edge of the hand blow is the single most useful and versatile hand striking technique. It can be made in many directions and from many positions. You should carefully determine the proper striking area of the hand which will give you the greatest efficiency without any danger of hurting or injuring your hand. It is not at all necessary to "condition" (harden or callus) your hand to use this blow. Before karate was a popular word, this blow was commonly referred to as the "judo chop." It is used in many methods and systems of karate. The exact area which you use is *between* the bones of the wrist and the little finger without hitting either bone; your hand must be slightly cupped so that you are hitting with the fleshy, cushioned part of the hand. To find the proper hitting area, strike lightly with the edge of the hand onto a hard surface, such as a tabletop. Increase the intensity of your blows until you are striking with force, but continue to correct yourself so that you do not feel pain. When you strike correctly, you may feel a stinging sensation but you should not feel any pain at all in the bones of your fingers, wrist, or along the edge of your

hand. Your fingers are held together and the thumb lies flat alongside your hand; it is incorrect to hold the thumb out from the hand when using this blow.

32



33



Fist

33. The fist blow is not as versatile as the open hand blow, and women feel uncomfortable using a fist blow for any purpose at all. Men, on the other hand, sometimes feel uncomfortable about using the open hand — although it is far superior to fist blows — and need to learn the proper use of closed hand striking because of its connotation of "power" and "masculinity." The area for hitting with the closed hand is the two large knuckles.

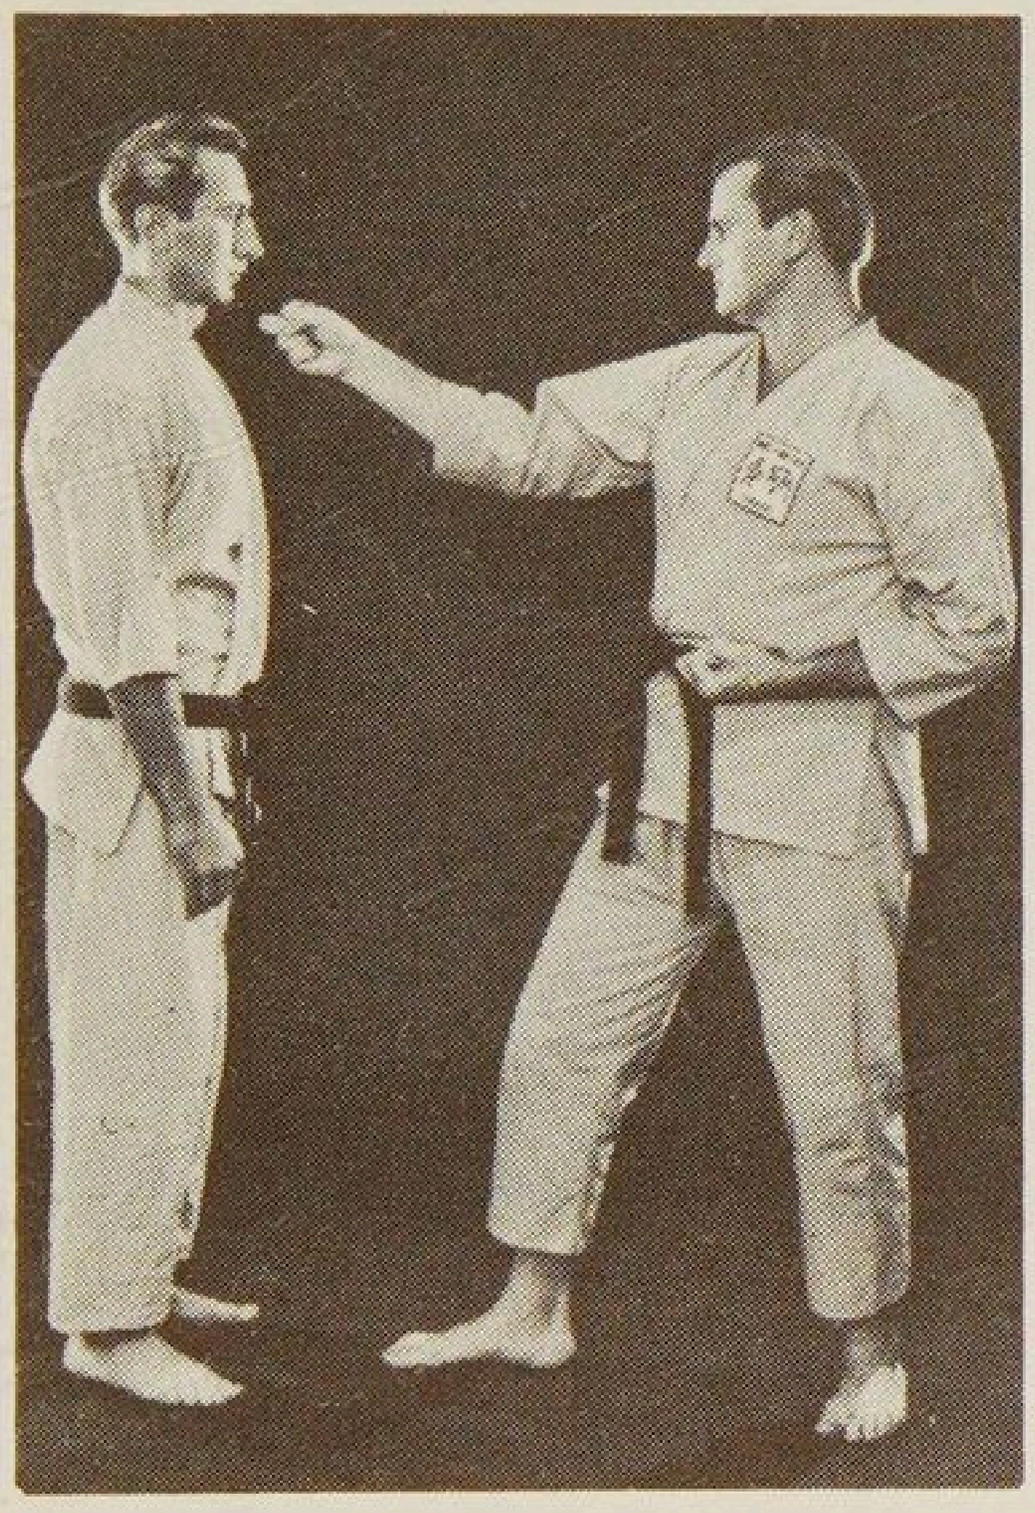
Extended Knuckle Blow

34. This method of striking has the advantage of being an unconventional technique, which is disconcerting to an assailant, yet it is closely enough related to a fist blow that many men prefer to use it. Women do not ordinarily feel comfortable using this type of blow. Make a fist and extend the center knuckle so that it is obviously forward. The hand can be held horizontal or vertical for this blow. Do *not* practice hitting in this fashion against a hard surface. For modern use with unconditioned hands, this is a blow which should be directed only into soft body areas.

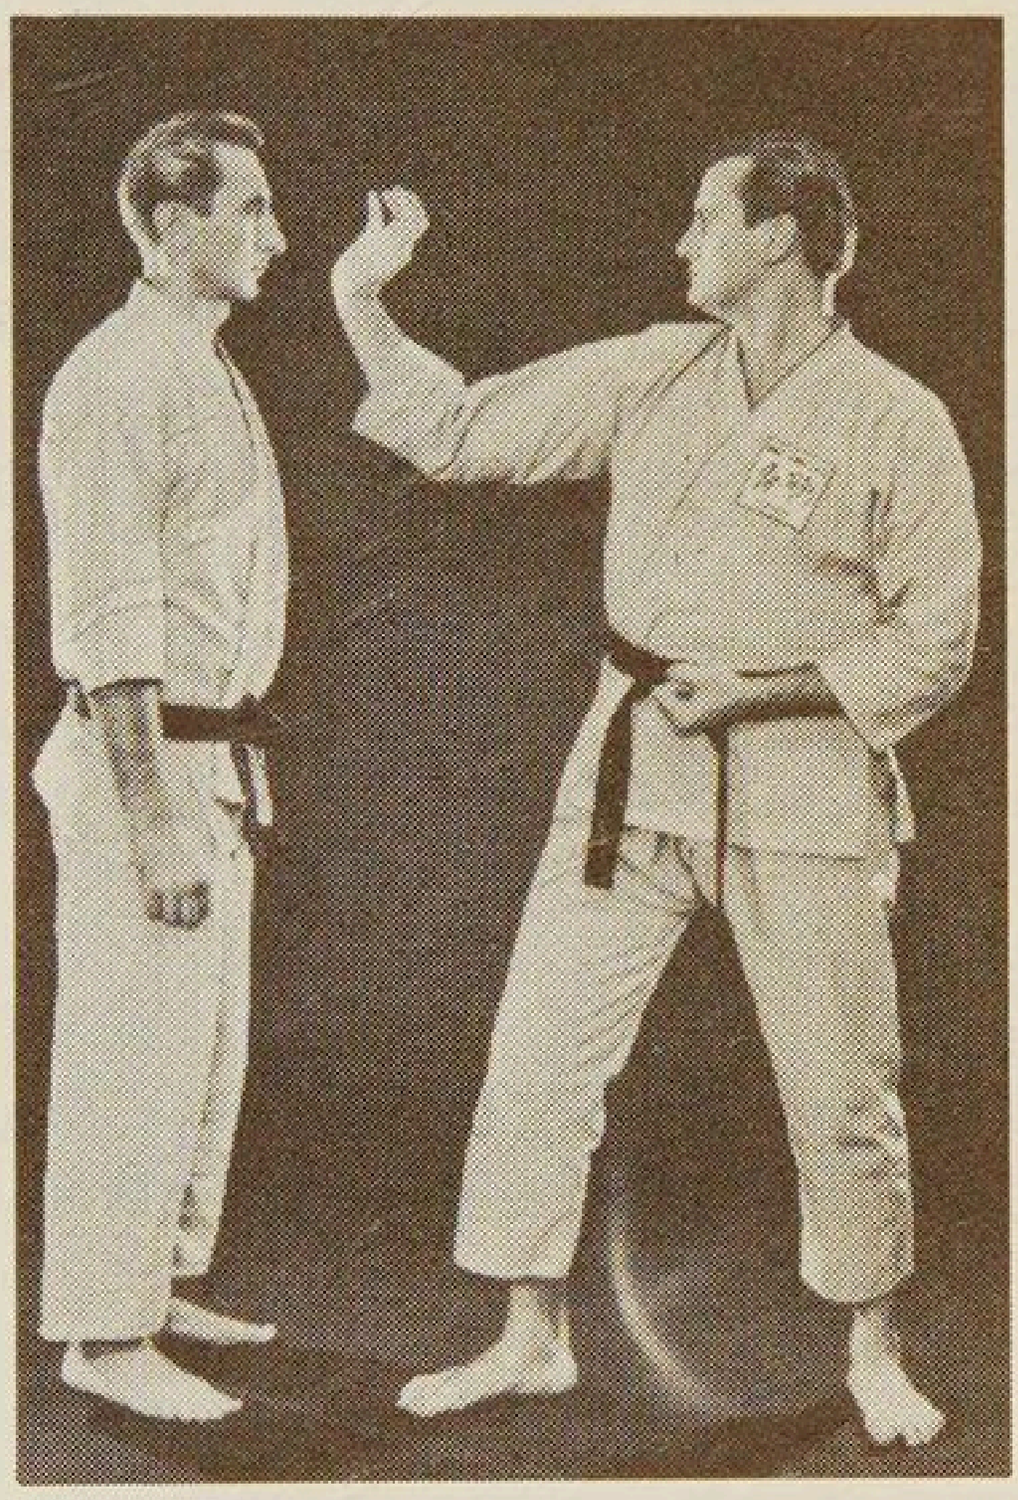
Heel-of-the-Palm Blow

35. Though limited in its use, the heel-of-the-palm blow is very important to learn properly because it can easily be applied by a smaller person against a much larger, heavier assailant. With the fingers held close together and drawn back, expose the edge of the heel of the palm. This is almost always used as an upward blow.

34



35



36

Finger Stabs

36. There is limited use for finger stabs; but in certain situations which will be defined later, you will learn their special application. (Finger stabs are very popular in kung fu and other Chinese styles of karate.) The hand is somewhat cupped, fingers are extended, held close together, very firmly. The striking point is the tips of the fingers.

For jukado belt degrees, you must know how to use all the hand blows. For practical self-defense you will find that some hand blows seem more comfortable to you than others; you should stress those in your development of a style most suited to you — the individual.

FOOT POSITIONS FOR KICKING

Kicking is your most useful defense. Beyond what you need to know for achieving the belt degrees, you should train in kicking techniques to build a permanent response to attack. It takes practice to get to the point of automatic kicking response, but I cannot overemphasize the importance of such training for practical, lasting, effective self-defense knowledge.

What is being taught here is which part of the foot is used as a striking weapon, not how to kick. These are the five basic striking areas and they will be used in a number of different ways and in different combinations.

Although kicking practice with a partner is most safe when you train barefoot (as shown) you must keep in mind that you are more likely to use the kicks in actual self-defense when you are wearing shoes.

The Toe

37. This is a very effective striking point when you are wearing shoes. Using the toe requires more accuracy than some of the other striking points but it has the advantage of being a "natural" action and many people adapt themselves to it quite readily.

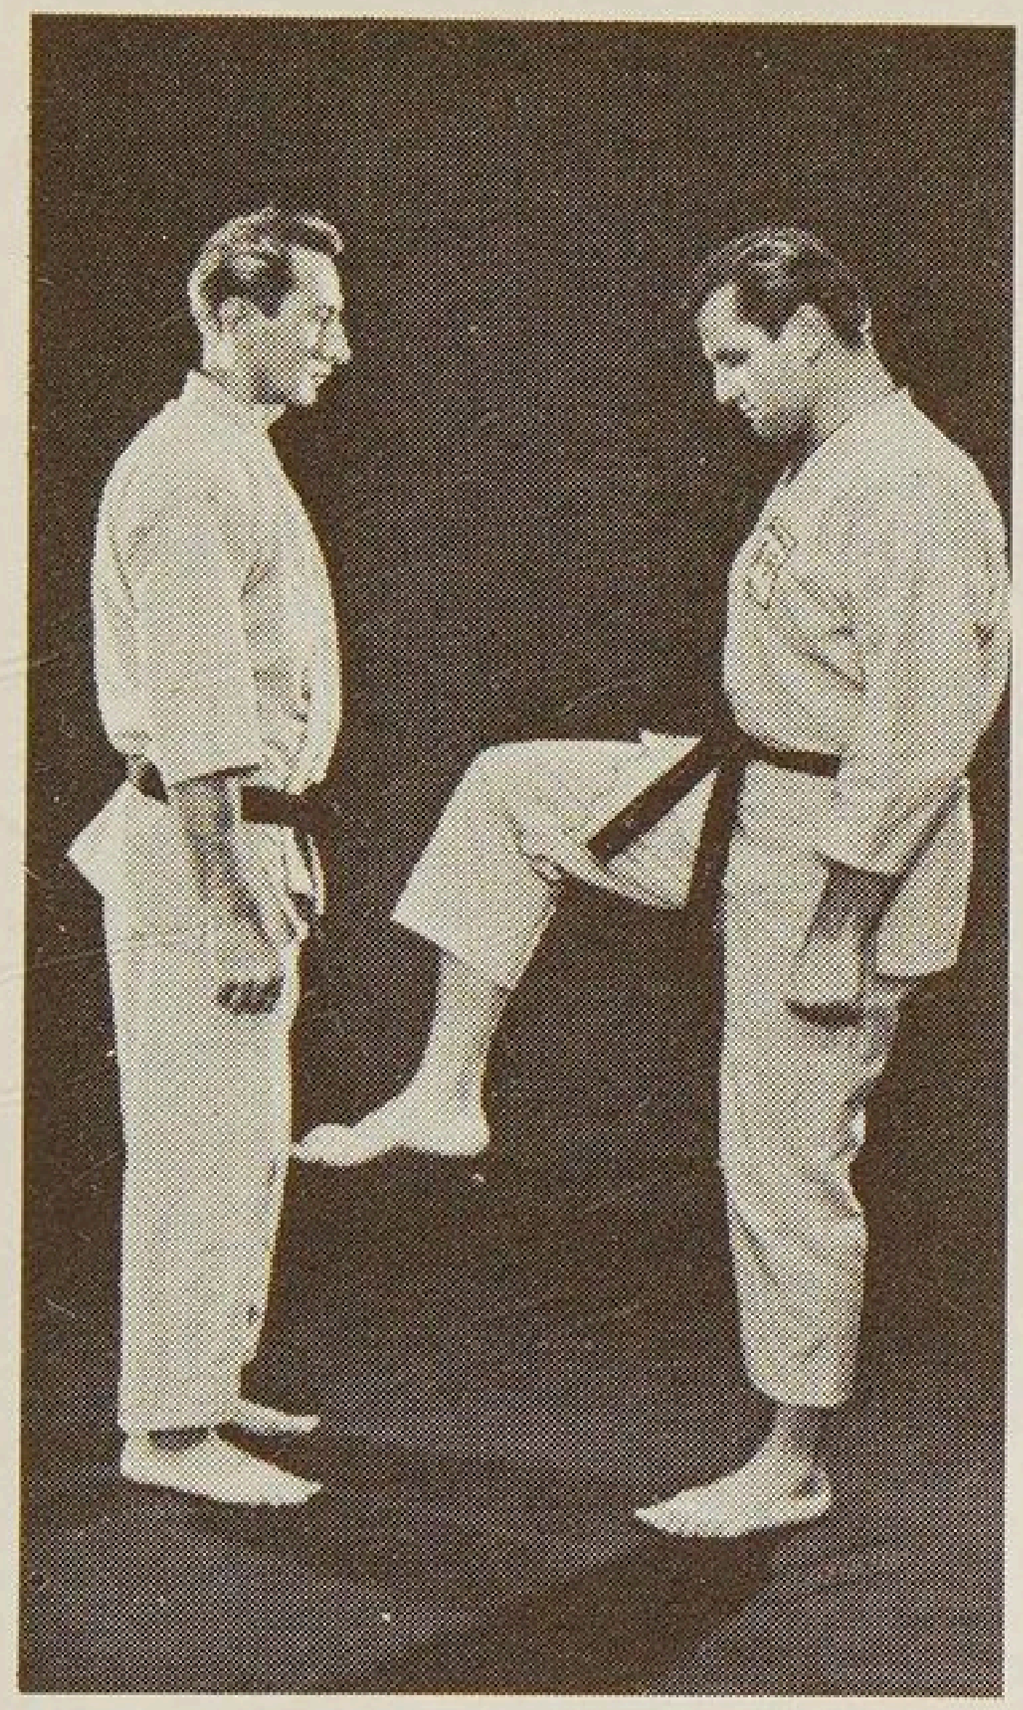
Ball of the Foot

38. If you are wearing soft shoes or are barefoot, use the ball of the foot instead of the toe.

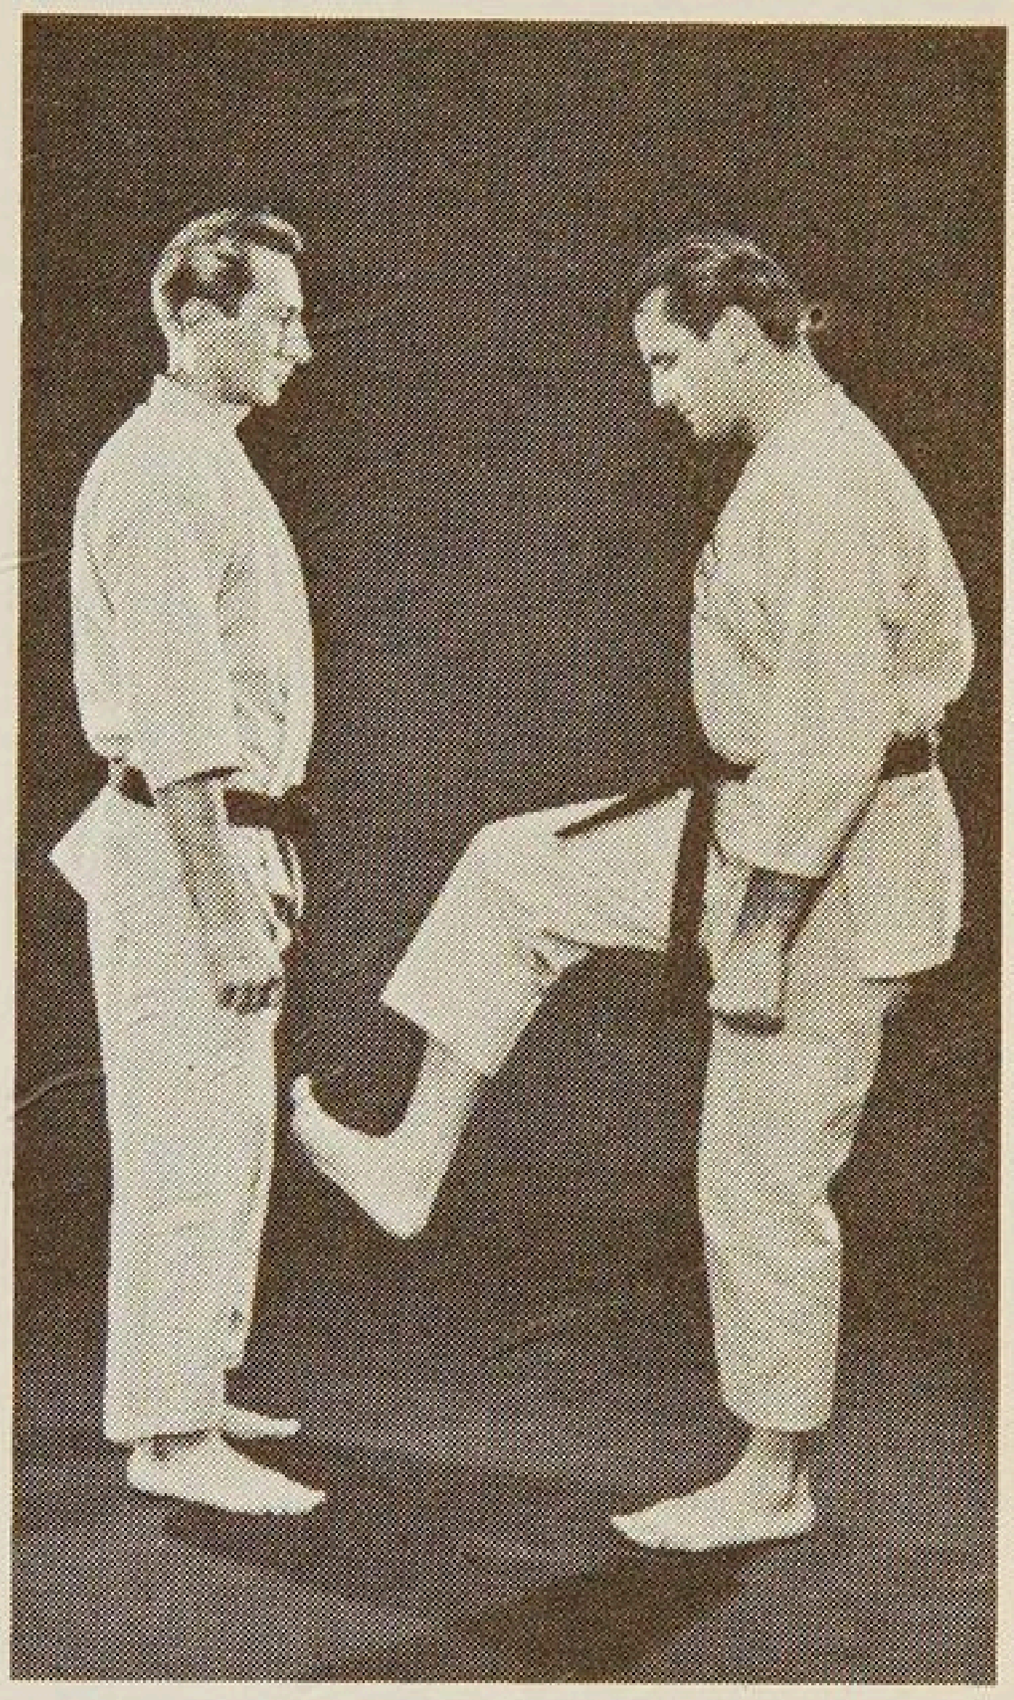
Edge of the Shoe (or Foot)

39. This is an excellent striking point when you are wearing shoes; the edge of the sole provides a sharp, cutting aid. Because of the amount of striking surface which is used here, you can deviate from the center of the foot and still deliver an effective blow.

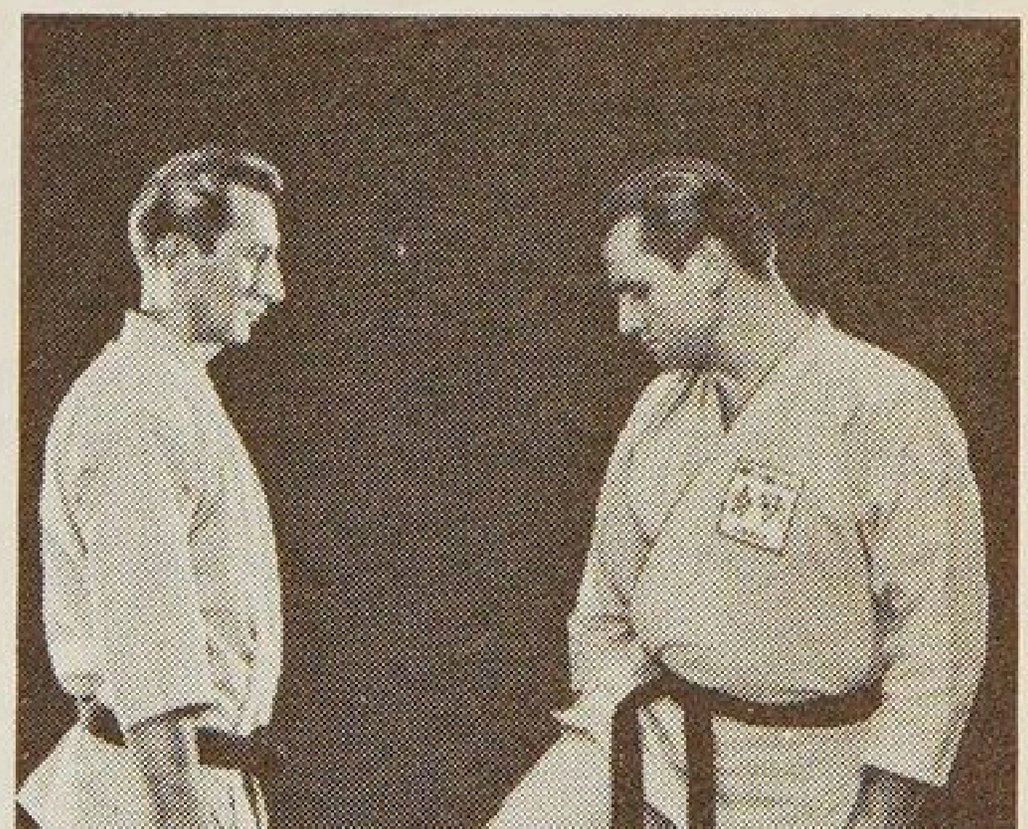
37



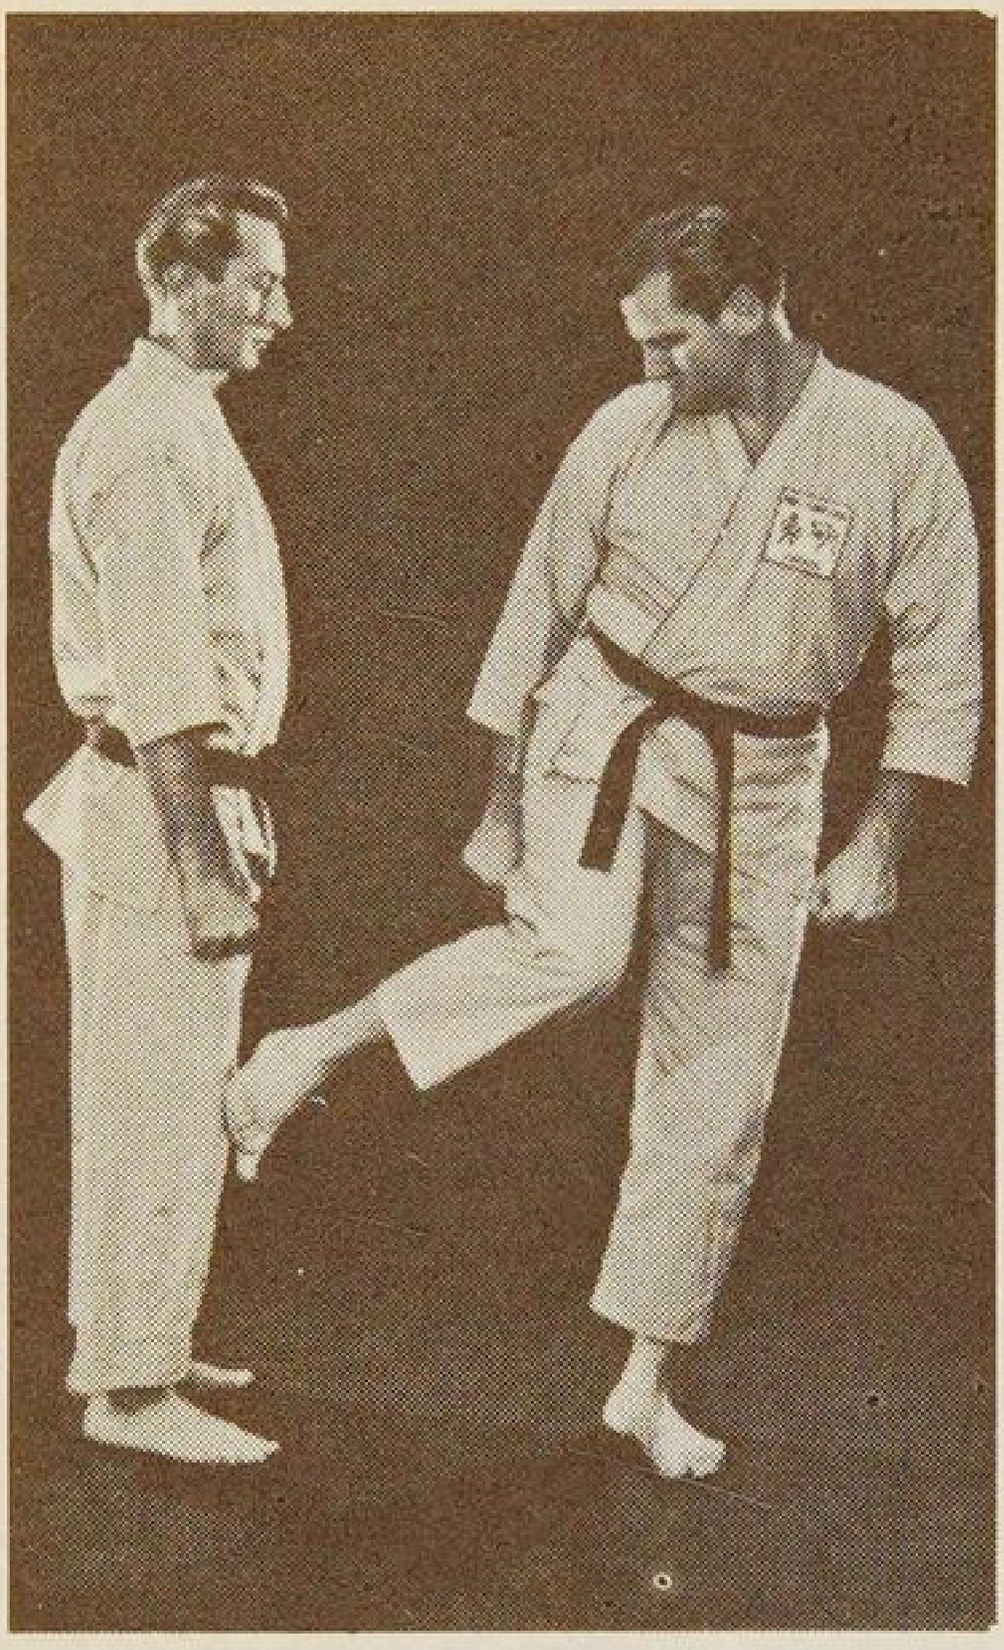
38



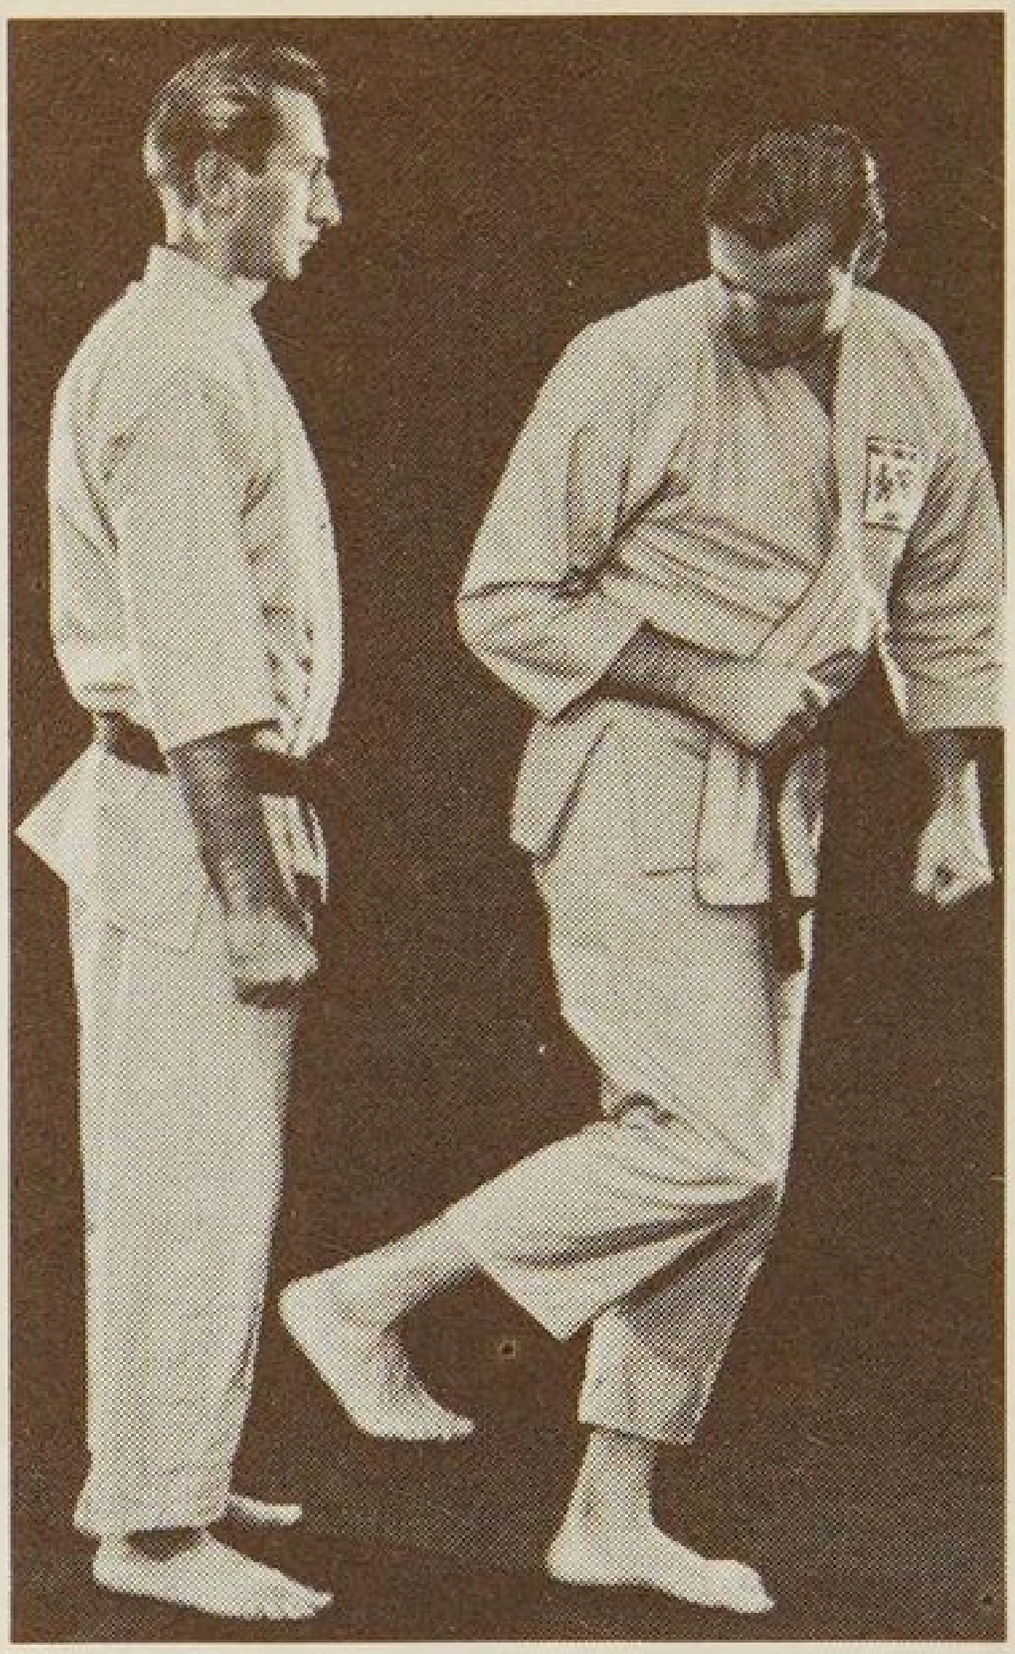
39



40



41



Bottom of the Foot

40. The entire length of the bottom of the foot (or shoe) can be used whether you are wearing shoes or are barefoot. Striking with the heel takes more practice for accuracy, though it is a more forceful blow; striking with the center of the bottom (the arch) allows an effective kick to be delivered without requiring perfect precision.

The Heel

41. Ordinarily this striking point would be used for a rear kick and is effective wearing shoes or barefoot.

MUSCLE REACTION: BODY REACTION

There are automatic reactions to force which you can take advantage of if you understand them. In judo and aikido it has been referred to as the "giving way" principle, but that does not adequately describe the full range of action and reaction which it means to explain.

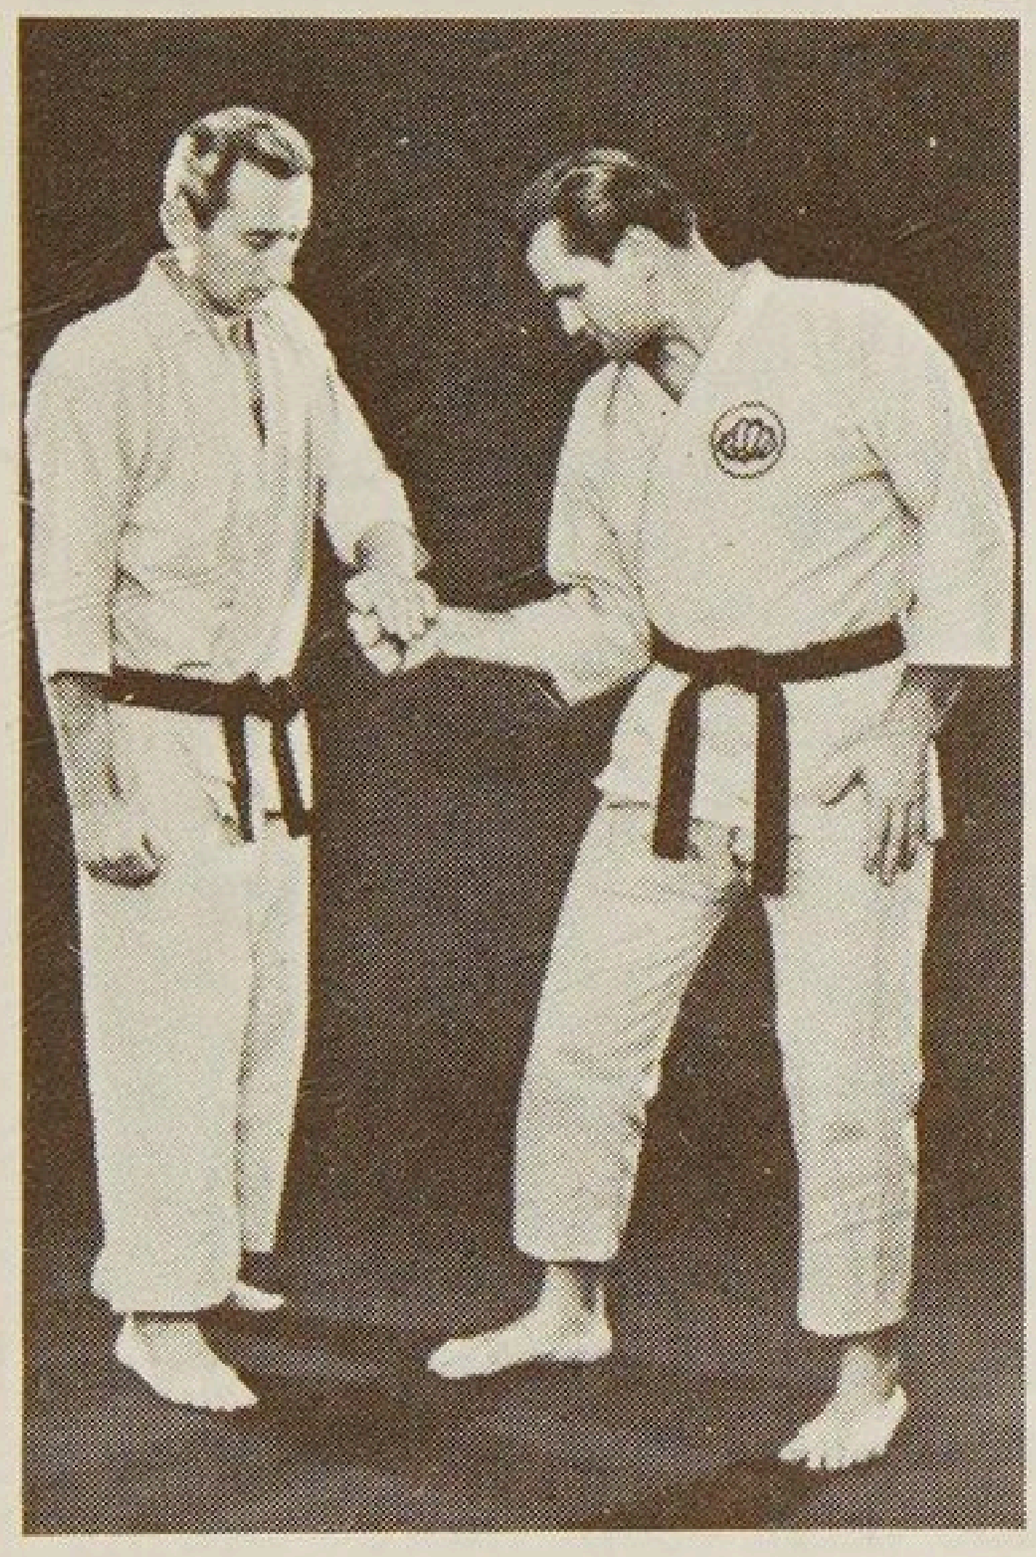
You can experiment in this fashion: Do not tell your partner what you are trying to do and you will have a completely unrehearsed demonstration of muscle reaction.

42. Ask him to make a fist and instruct him to push up as hard as he can, while you push down on his fist.

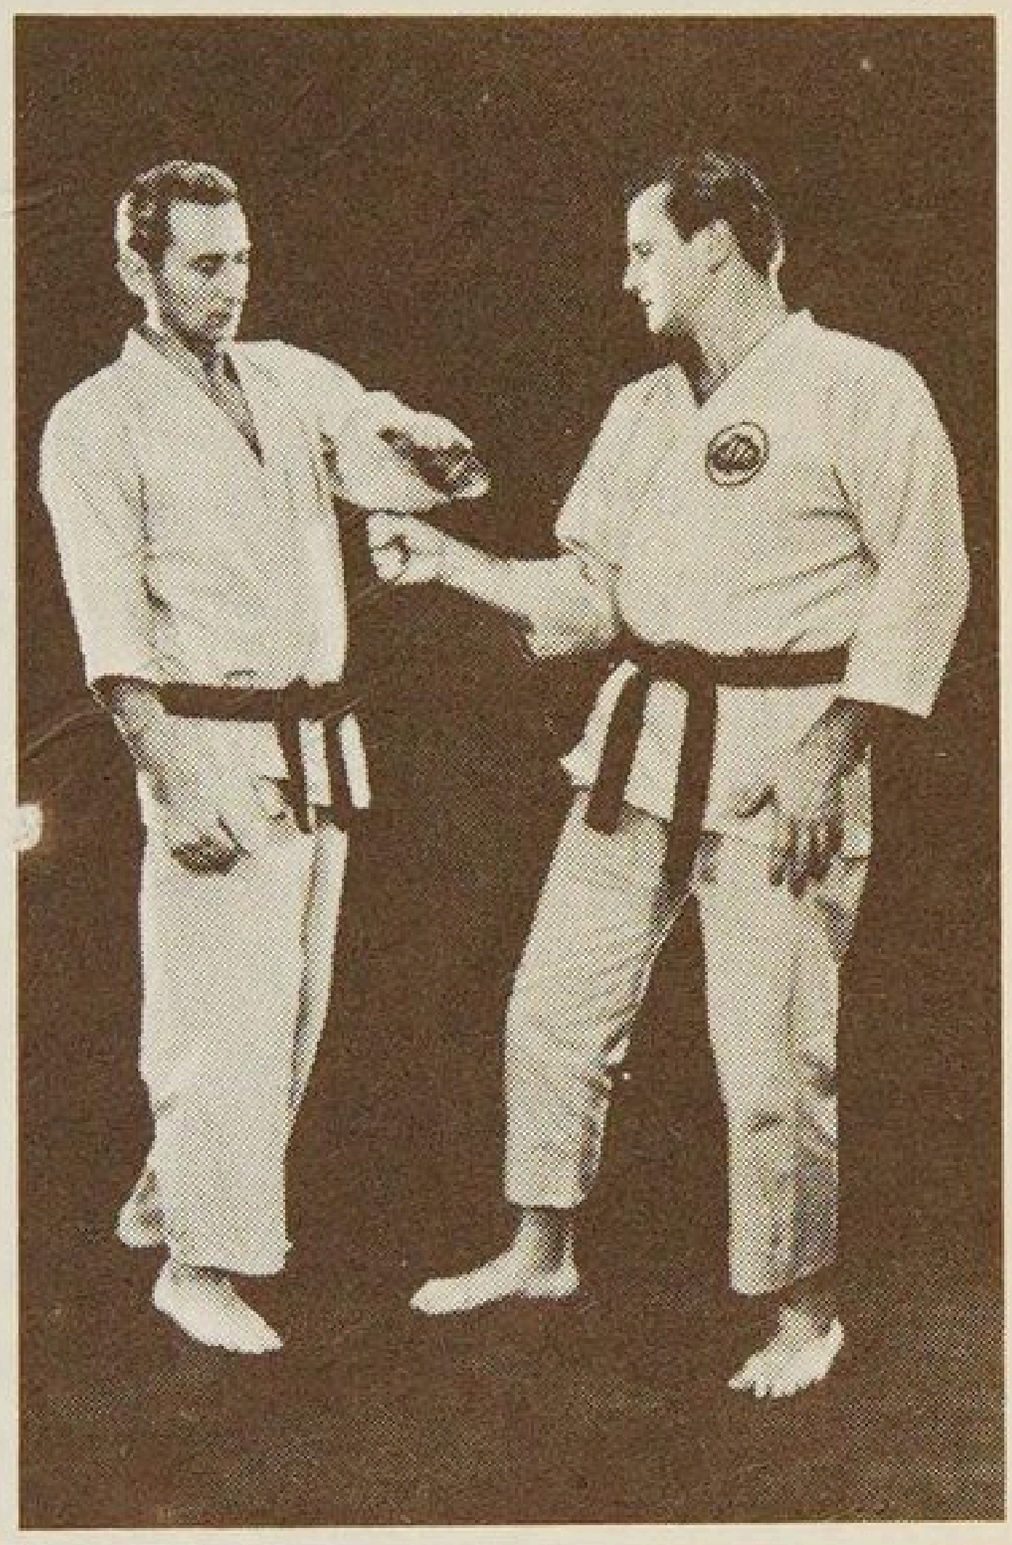
43. If you suddenly remove your hand, his fist will rise quickly as the result of his own action.

44. Body reaction is the same principle applied on a larger scale. If you ask your partner to pull back while you pull him forward, and then suddenly release your grip, he will move backward as the result of his own action, 45.

42

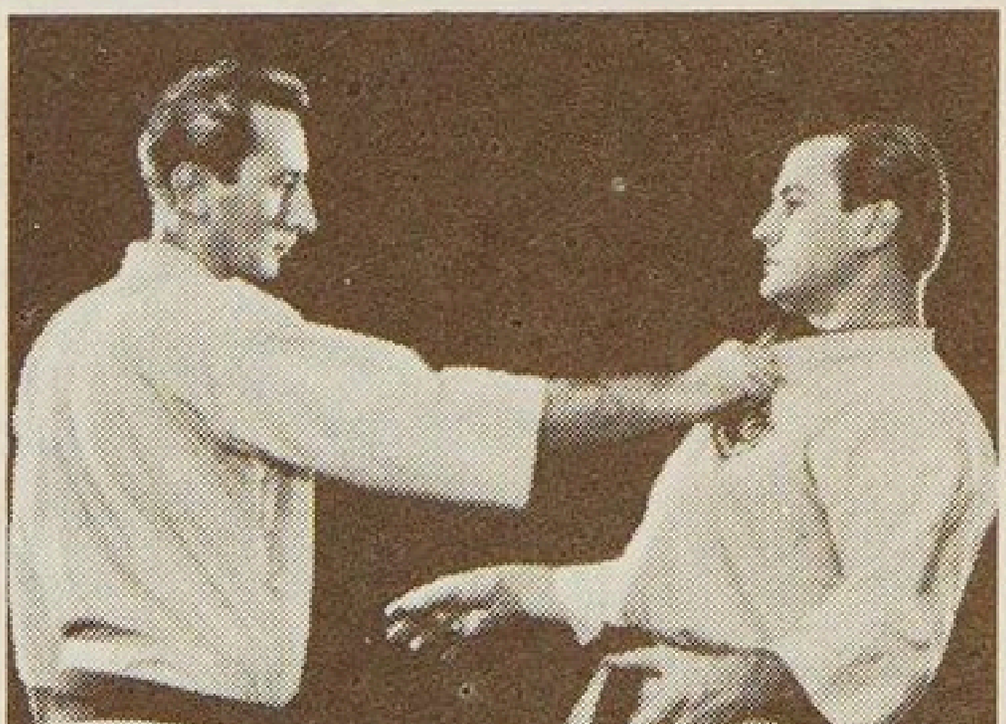


43



44

45



There are many instances, in both sport and self-defense work, when you can get your opponent or adversary to supply much of the force necessary to defeat himself. Specific examples will be noted throughout the text.

NATURAL AND UNNATURAL GRIP

Natural grip is the manner of gripping normally used for shaking hands. Whether you grip the arm or cloth, when you are instructed to use a natural grip, reach out as though to shake hands, 46 and 47.

48, 49. When you are instructed to use an unnatural grip, turn your hand over, so that the thumb is pointed down, then grip.

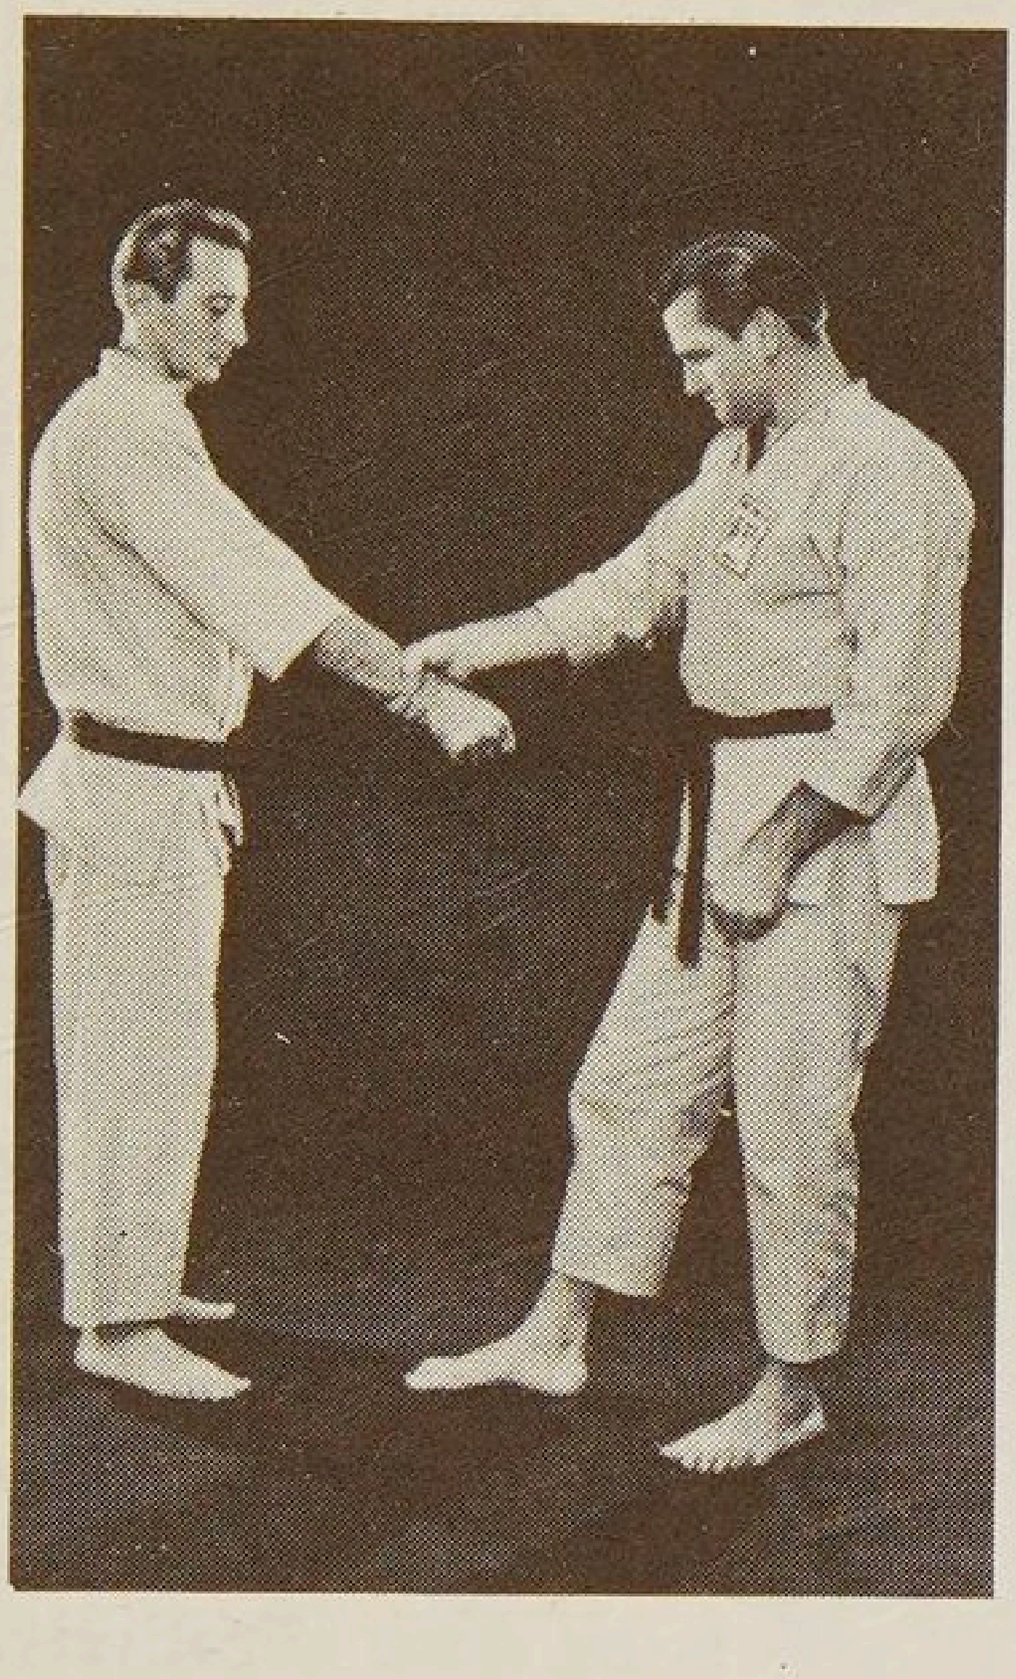
SAFETY AND CONTROL

Teacher *and* student must have the same approach, if training accidents are to be avoided. The elements which insure safety in training are these: Safety must be considered a desirable aspect of training. The student must have confidence in the efficacy of the techniques. There must be mutual respect between teacher and students and among the students.

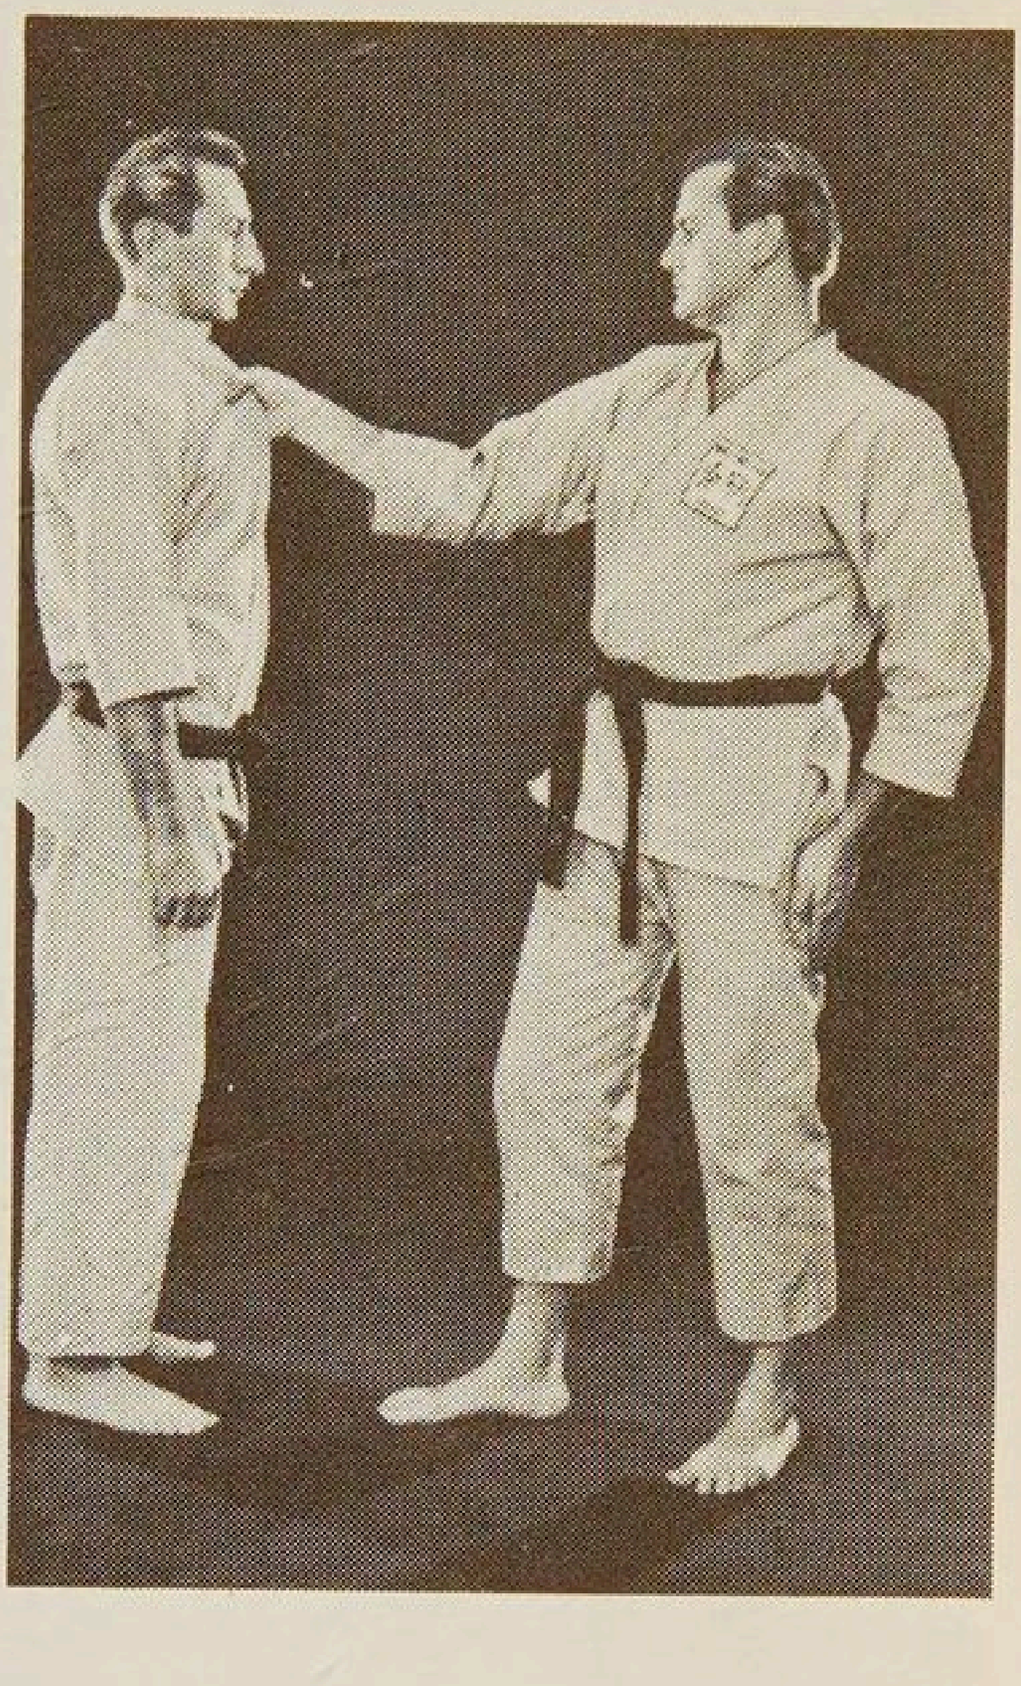
In the old-fashioned method of training (still used by many teachers), safety was not an important consideration. Students who were hurt or injured in training were expected to bear their injuries in brave silence and such behavior made them seem more "worthy" of the "honor" of being taught unarmed fighting. When actual hand-to-hand combat was the finishing school for these students, such an attitude was reasonable. In our time, students who benefit most from the modern type of training are those who are least likely to be attracted to the "learn by suffering" school of thought. Moreover, our students are not spending their entire lives in this practice (as did the feudal warriors) and they cannot afford to get hurt; they have work, school, and family obligations which are at least as important as their training here. When teacher and students consider safety as an important element of training, safety rules will be taught and applied.

The techniques upon which jukado is based are ancient, even though this system of combining them is new. These techniques have proven efficient for thousands of years. The purpose of this training is not to *prove* that they work, but to *learn* them. To learn them you do not have to hurt your training partner any more than you have to shoot people to prove a gun can kill. There is enough proof of the efficiency of jukado techniques to ask you to have confidence in them. Rough or violent training is not necessary for good learning.

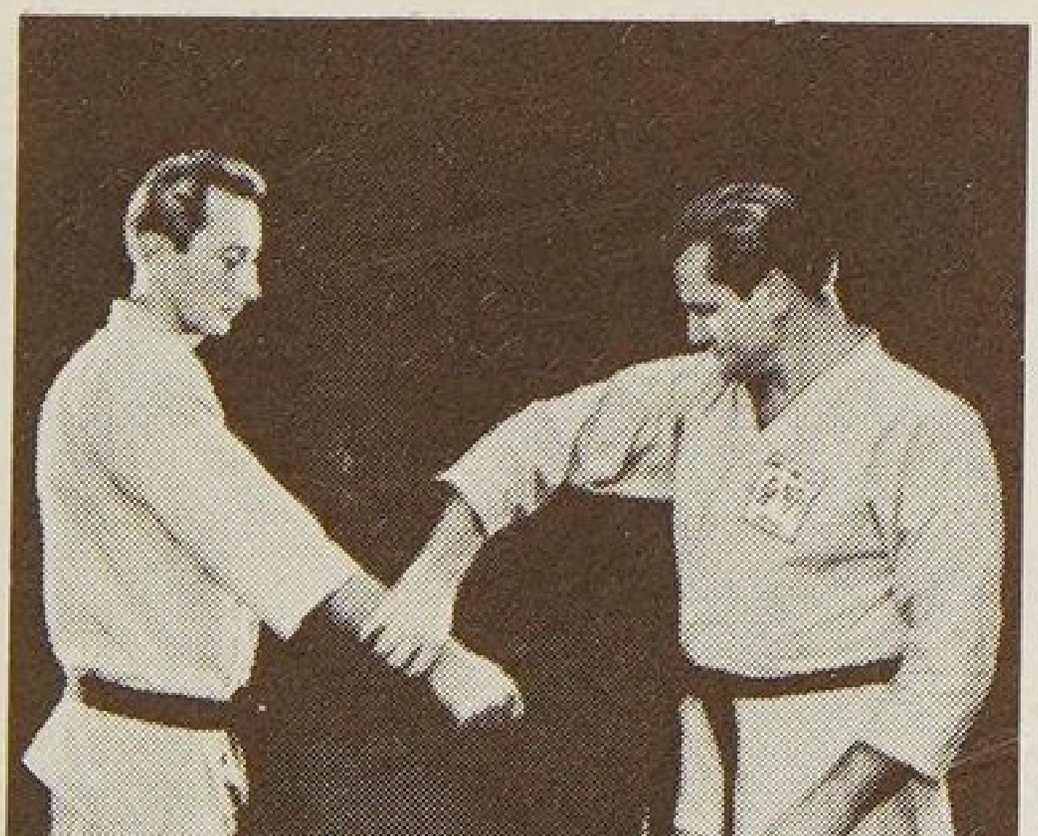
46



47



48



49

During your training, avoid working with anyone who has to show off. A teacher shows off when he treats a student with contempt. An advanced student shows off when he is more interested in winning over new students than he is in helping them to learn. In both cases, there is likely to be less concern for the safety of the newer students than there should be. The teacher, group leader, or practice partner who has *your* safety in mind is your best insurance against training accidents. Mutual respect and mutual concern should be encouraged.

THE RULES OF SAFETY

To obtain release or stop action, THE FIRST RULE OF SAFETY IS TAPPING! The hand tapping signal is better than a verbal signal to stop, let go, or relieve pressure. Get into the habit of using the tapping signal from the very beginning of your practice. Automatically, as a hold, lock, choke, or any pressure is applied, you will tap *at the very instant* that the technique results in pain. You do not have to suffer to learn. It is not brave, it is foolish, to allow chokes or painful holds and locks to be maintained beyond the point which indicates that the technique is being done effectively. Tapping is more effective than a verbal signal because it is more easily and quickly observed by your partner; in a room with other people practicing, he may not hear your verbal signal; in certain chokes or holds, you would find it impossible or inconvenient to talk.

The three ways of tapping for release are: tap yourself; tap your partner; tap the mat. The usual signal is two taps.

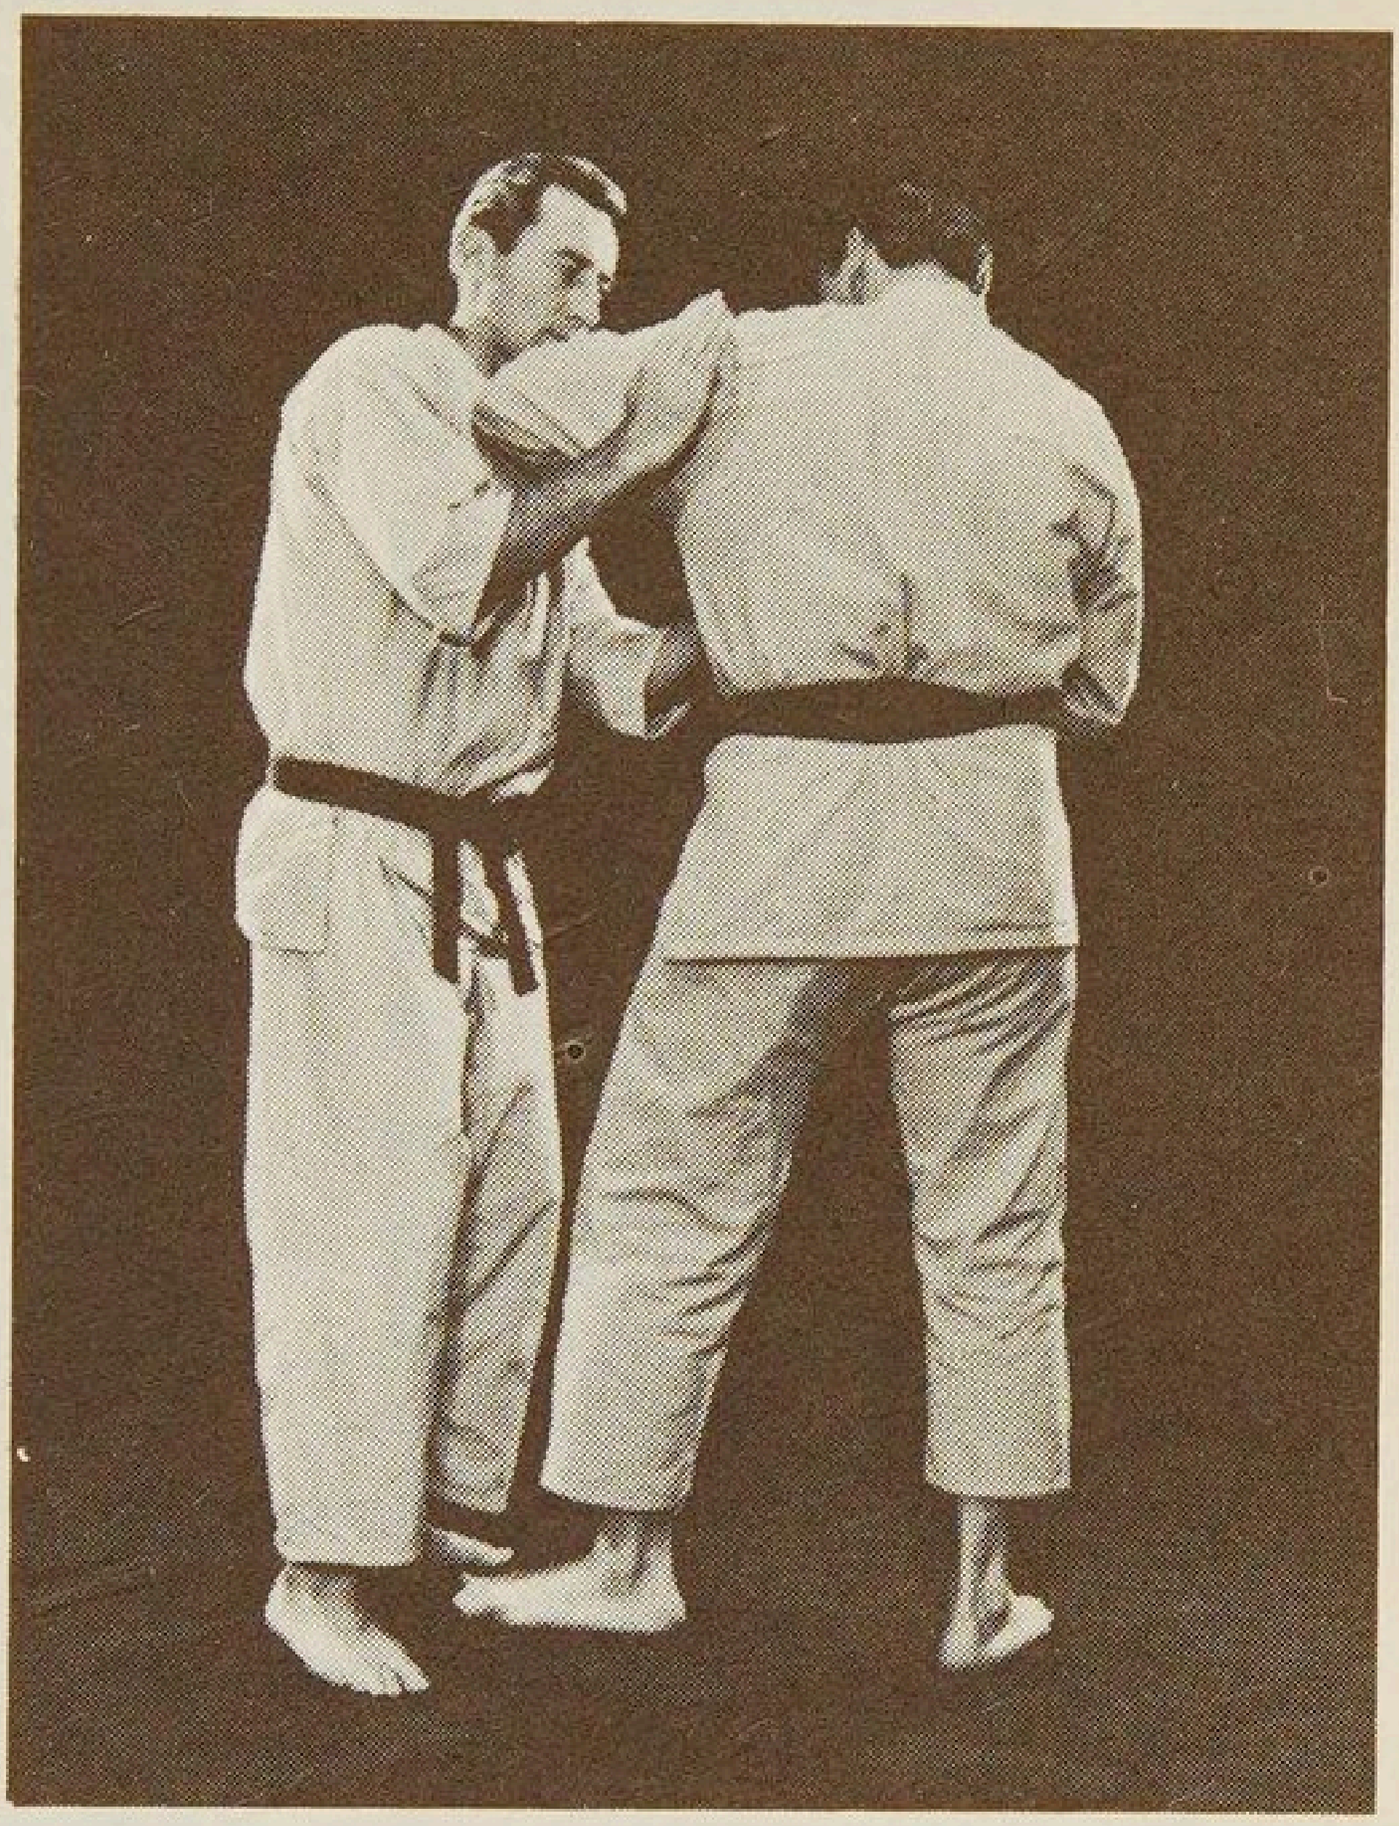
Examples of tapping for release and for stop action:

50. Your partner taps you; *immediately* upon feeling the tapping signal, release the hold.

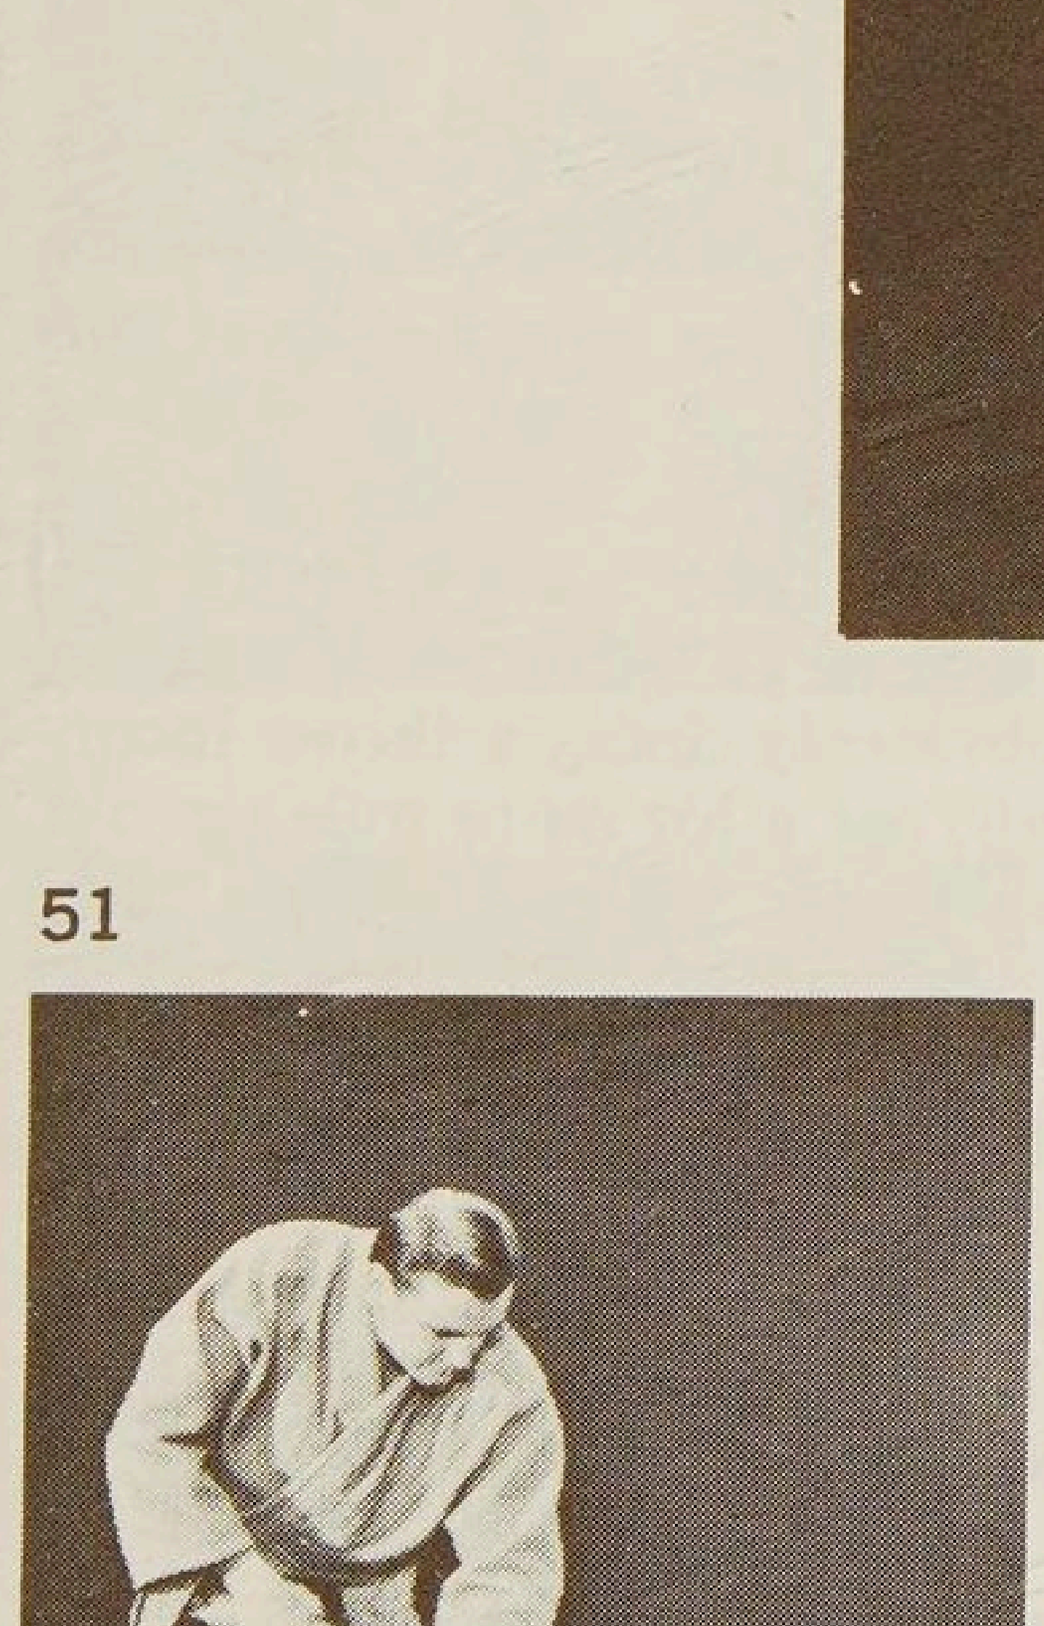
51. When your partner is in a lowered position, he may tap the mat; be alert for his signal and release immediately.

52. From this or similar positions, be alert for your partner to tap himself; release immediately. When tapping yourself or the mat, do it with enough sound that your partner gets the message immediately.

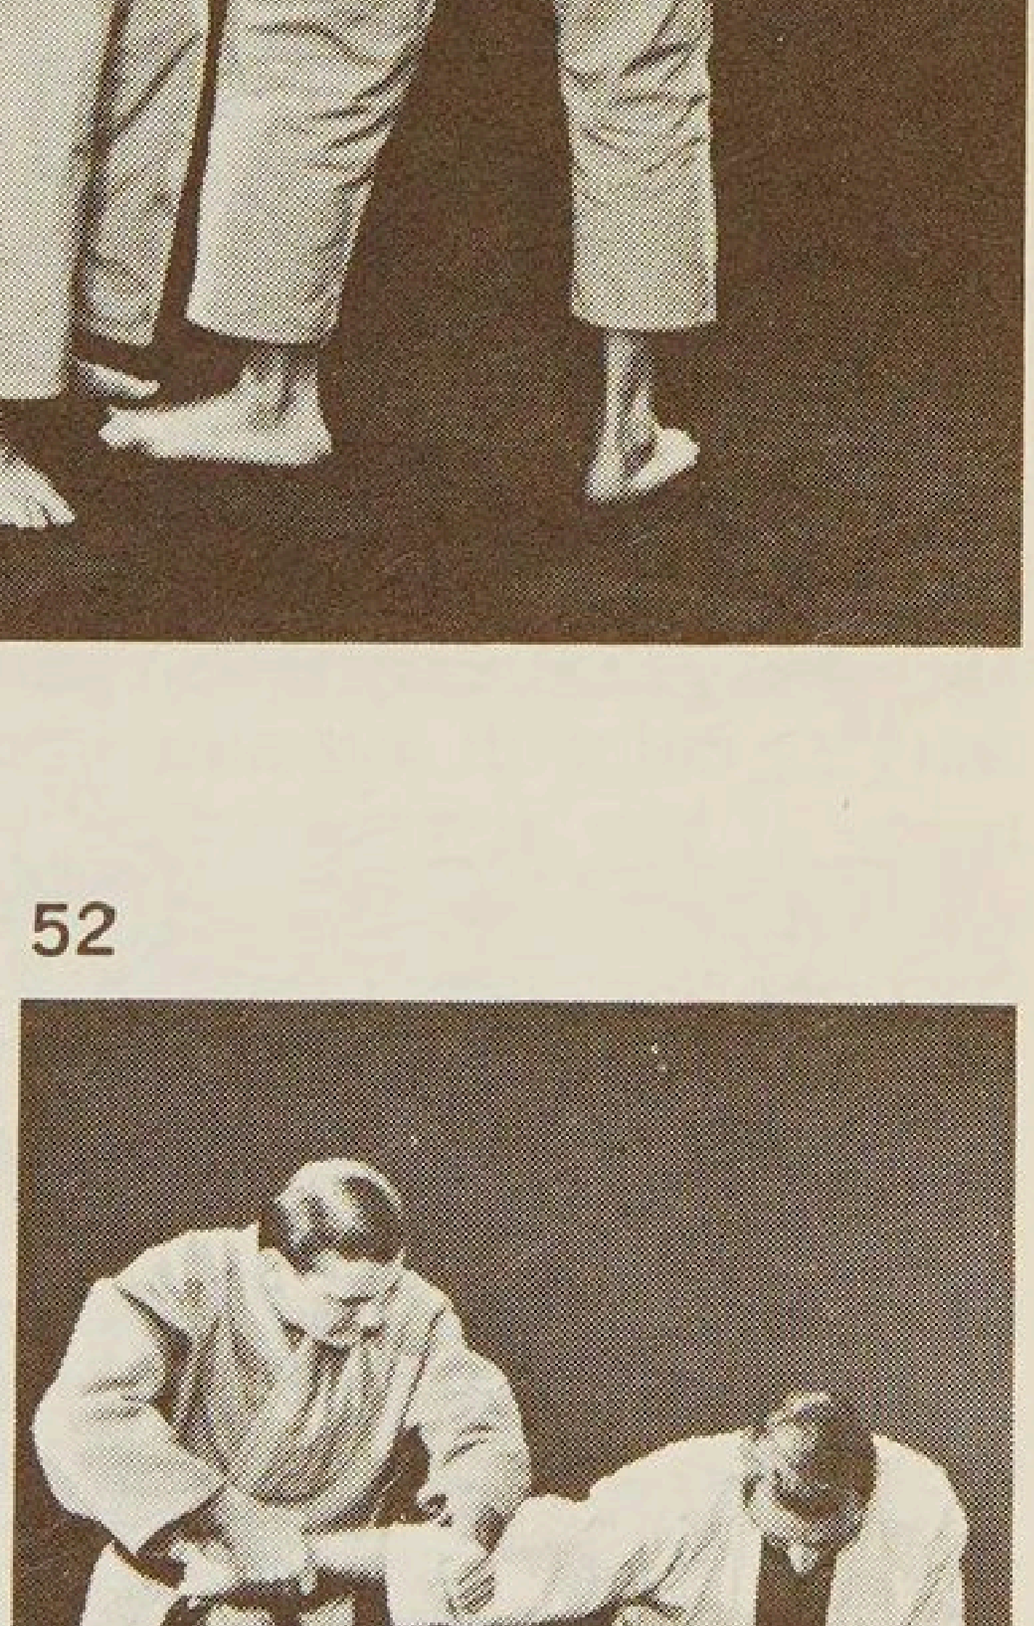
50



51

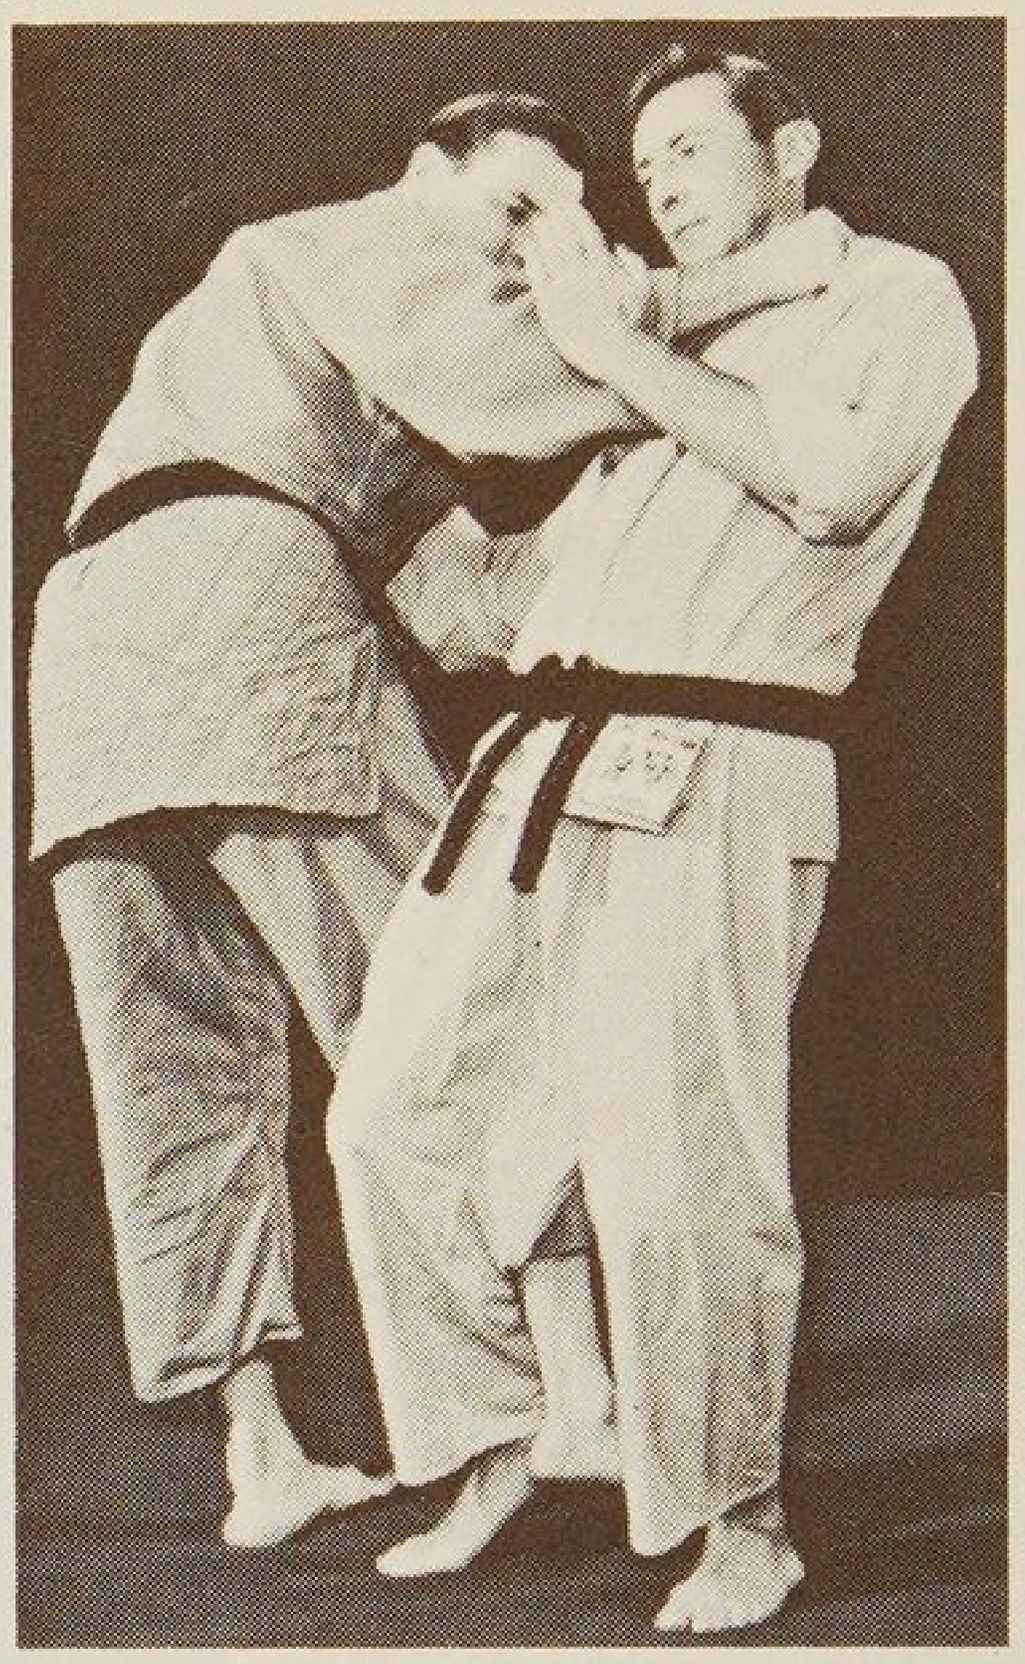


52



53

54



53, 54. *Stop the action* is the message of the tapping signal and it can be used for safety in throwing practice in a number of situations. For instance: with someone who is just learning the first steps of a throwing action; with someone who cannot be thrown (but will practice up to the point of actual throw), and if you are working out with someone who is obviously doing a throw incorrectly. If you stop the action, you will get a lot more mileage out of your throwing practice time than if you let yourself be fully thrown at every try.

HOLDS AND LOCKS: Practice Safety

DO: 55. Apply the pressure slowly and gradually with constant pressure when practicing all holds, locks, and chokes. Be alert for the tapping signal and release immediately.

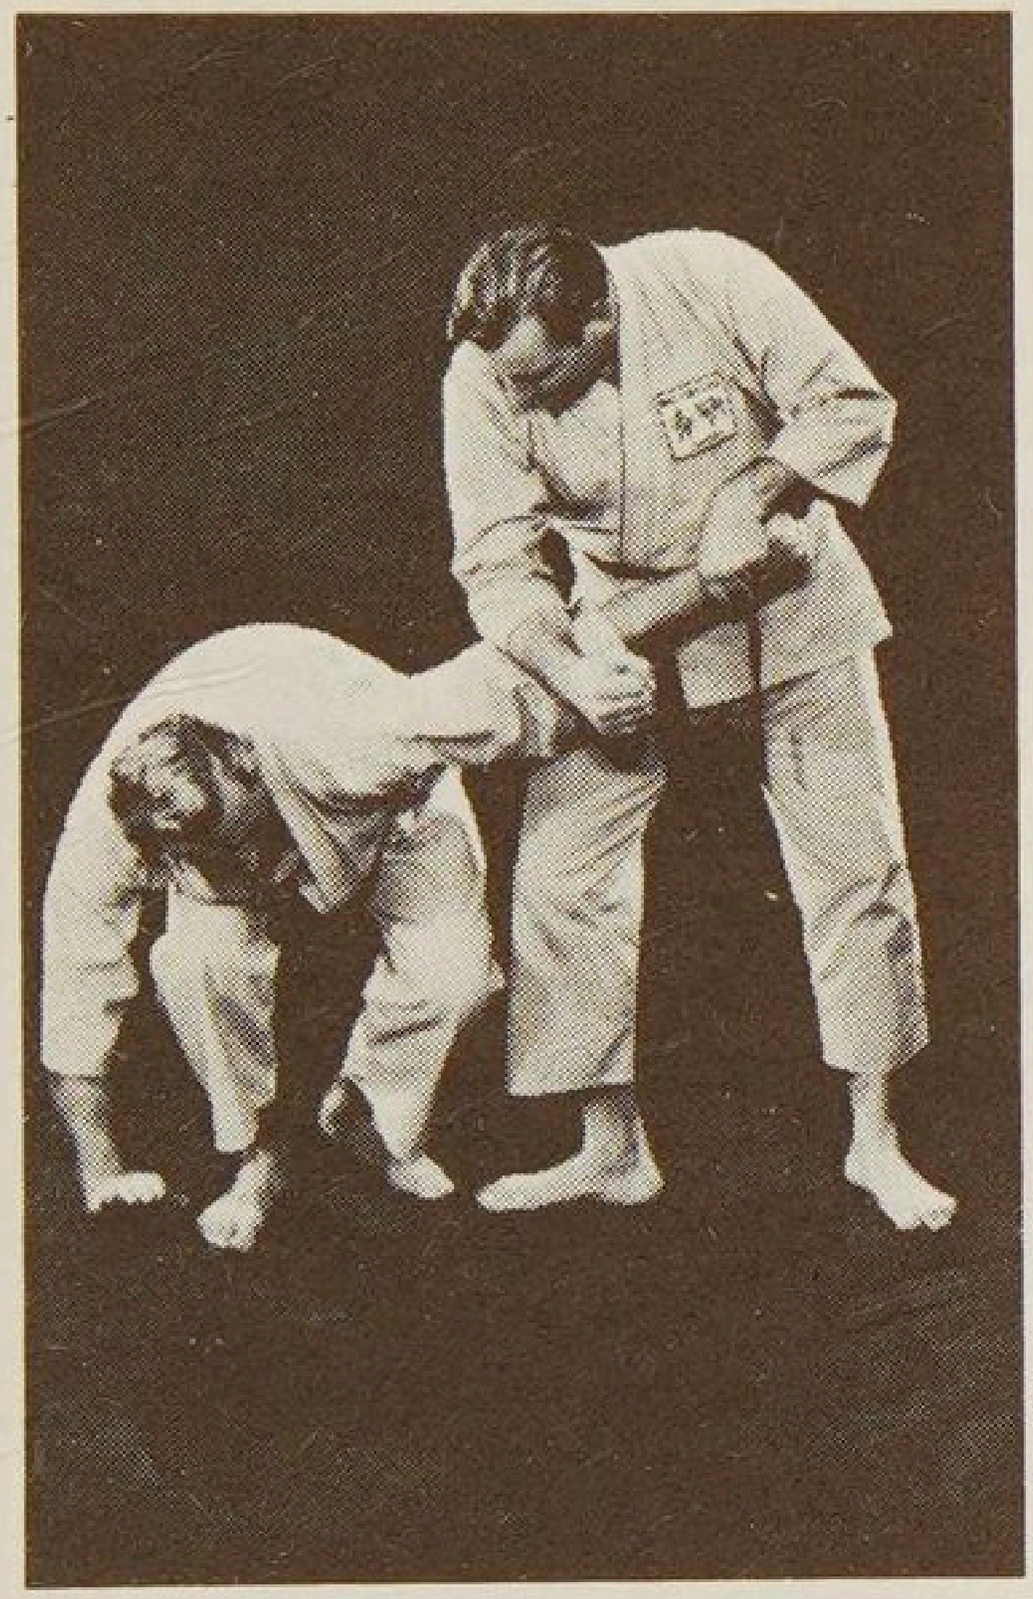
DON'T: 56. Do not apply forceful, jerky, or snapping action when practicing holds, locks, and chokes.

PULLING HAND AND FOOT BLOWS FOR SAFETY IN PRACTICE

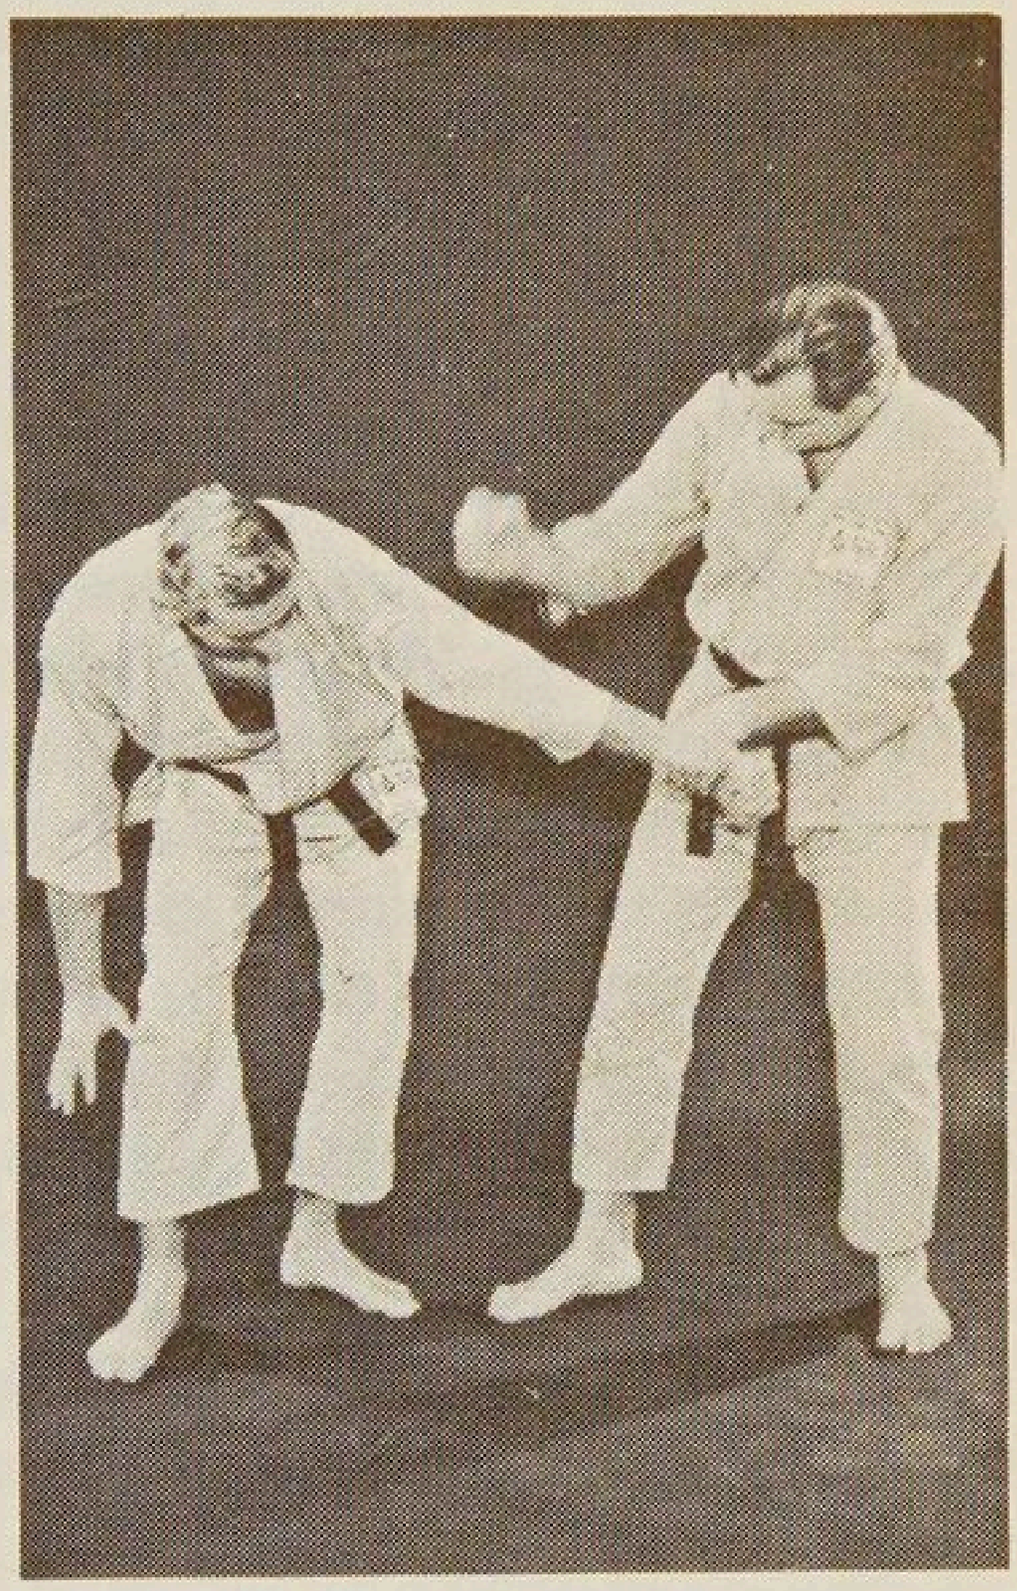
57, 58. Stop within two inches when simulating hand and foot blows. As a beginner you must be very careful not to let your excitement or enthusiasm overcome your good sense. Until you learn control and precision, stay even farther away from vital areas when practicing hand and foot blows; do not come within six

inches of eyes, windpipe, or kidney. It is very dangerous to work with a partner who cannot or will not control his blows. There is no need for contact to be made and no reason for you to put up with fools or incompetents who may injure you.

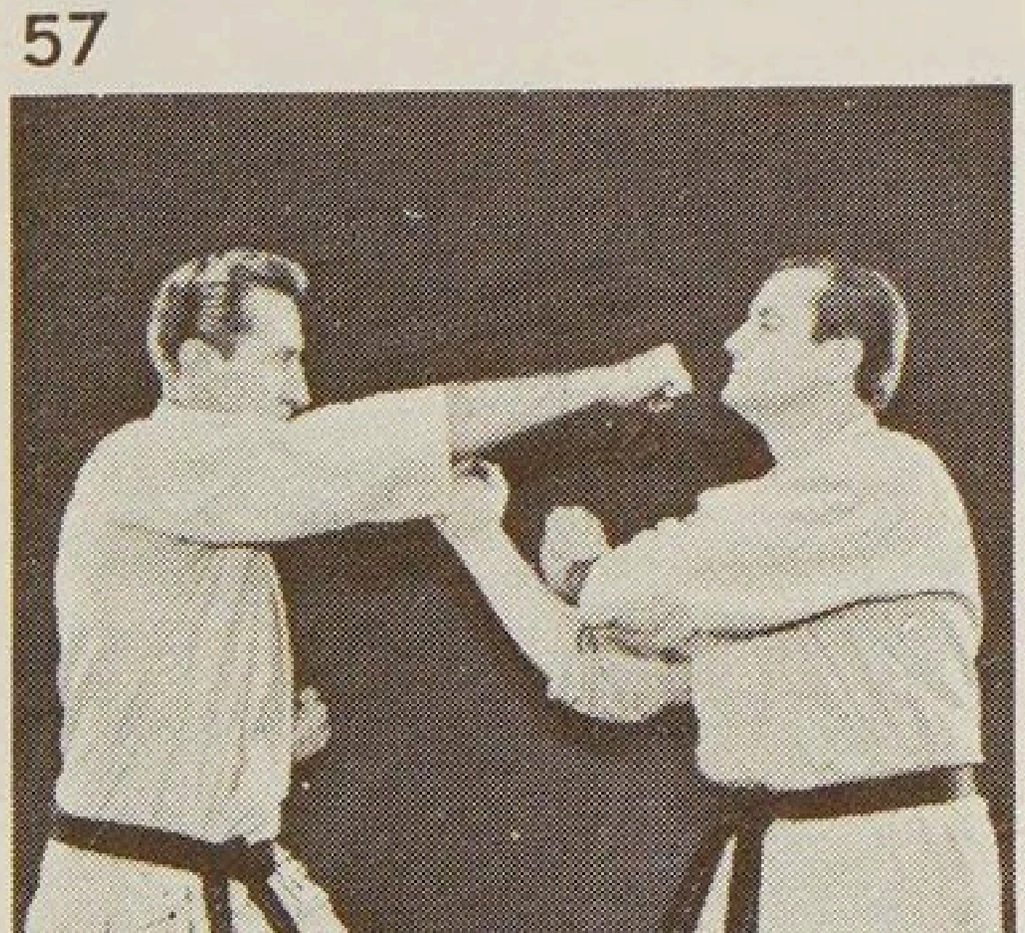
55



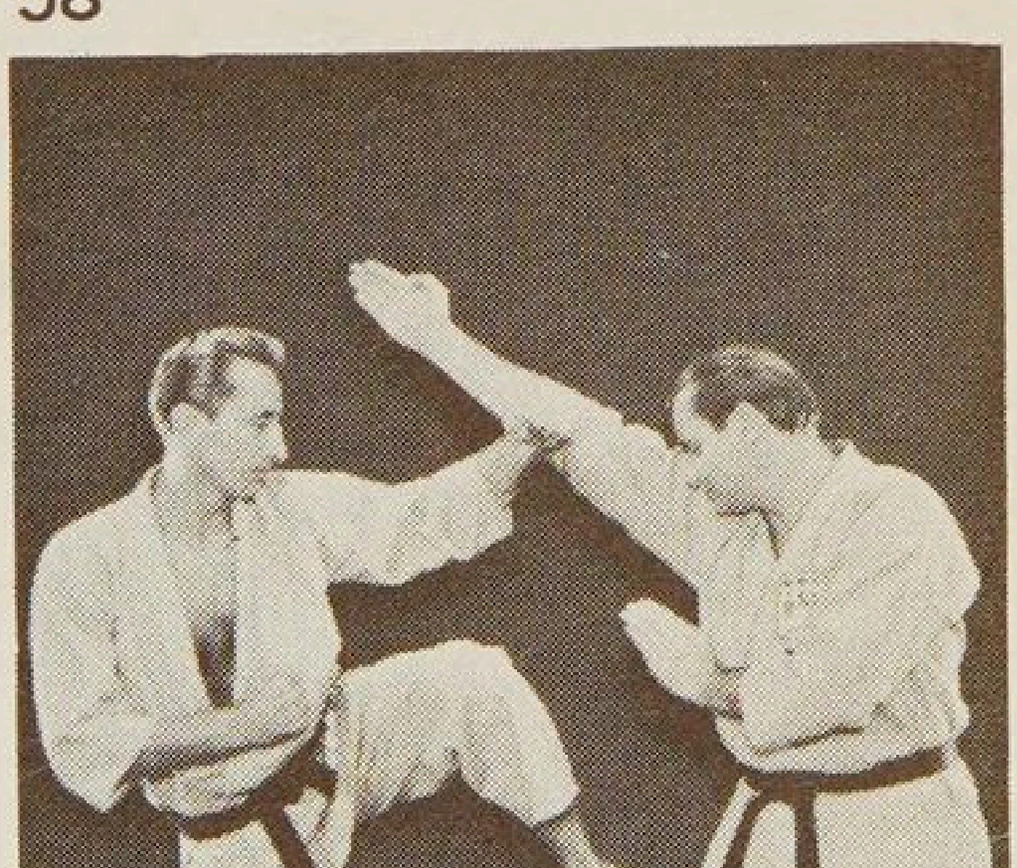
56



57



58



THROWING PRACTICE SAFETY

Throwing practice accidents can be almost totally eliminated if you will observe *all* the safety rules. In the older styles of teaching throwing techniques, safety was not even considered as an important factor, and throwing accidents and injuries are common even today when the old style of training is followed. Throwing safety rules are based on two factors — courtesy and prudence.

Throwing should only be practiced on a surface which is suitable. The best surface is a judo, wrestling, or similar mat; minimum size for safety is 10′ x 10′ or 9′ x 12′. If you cannot get or use a standard mat, you can improvise by using two or three layers of felt or rubber padding used under a rug. The covering of your mat may be canvas or plastic and should be fairly smooth. There should not be metal fasteners or anything on the surface or seams of the mat which could work loose and cause injury. If you do not have access to any such mat or improvised mat, it is possible to practice throwing on grass, sand, or a bed of wood shavings. If you do use this type of surface, make sure there are no sprinkler heads or any other materials in or on it which might be a source of injury.

Follow the instructions to the letter! Until you have become very proficient in throwing and are working with a partner who is proficient at being thrown, you must work slowly and carefully. Not only is this a good safety procedure, but it is a good way of emphasizing proper technique. A fast, sloppy throw is easier to execute than a slow, good throw. But, since technique is most important as a foundation for improvement, you will learn better if you work slowly at first. Speed is easy to add onto good technique.

Never throw anyone whose rank or training level you do not know. *Never* allow yourself to be thrown by anyone whose rank or training level you do not know. It is courteous and prudent to exchange information about training and rank before engaging in any throwing practice.

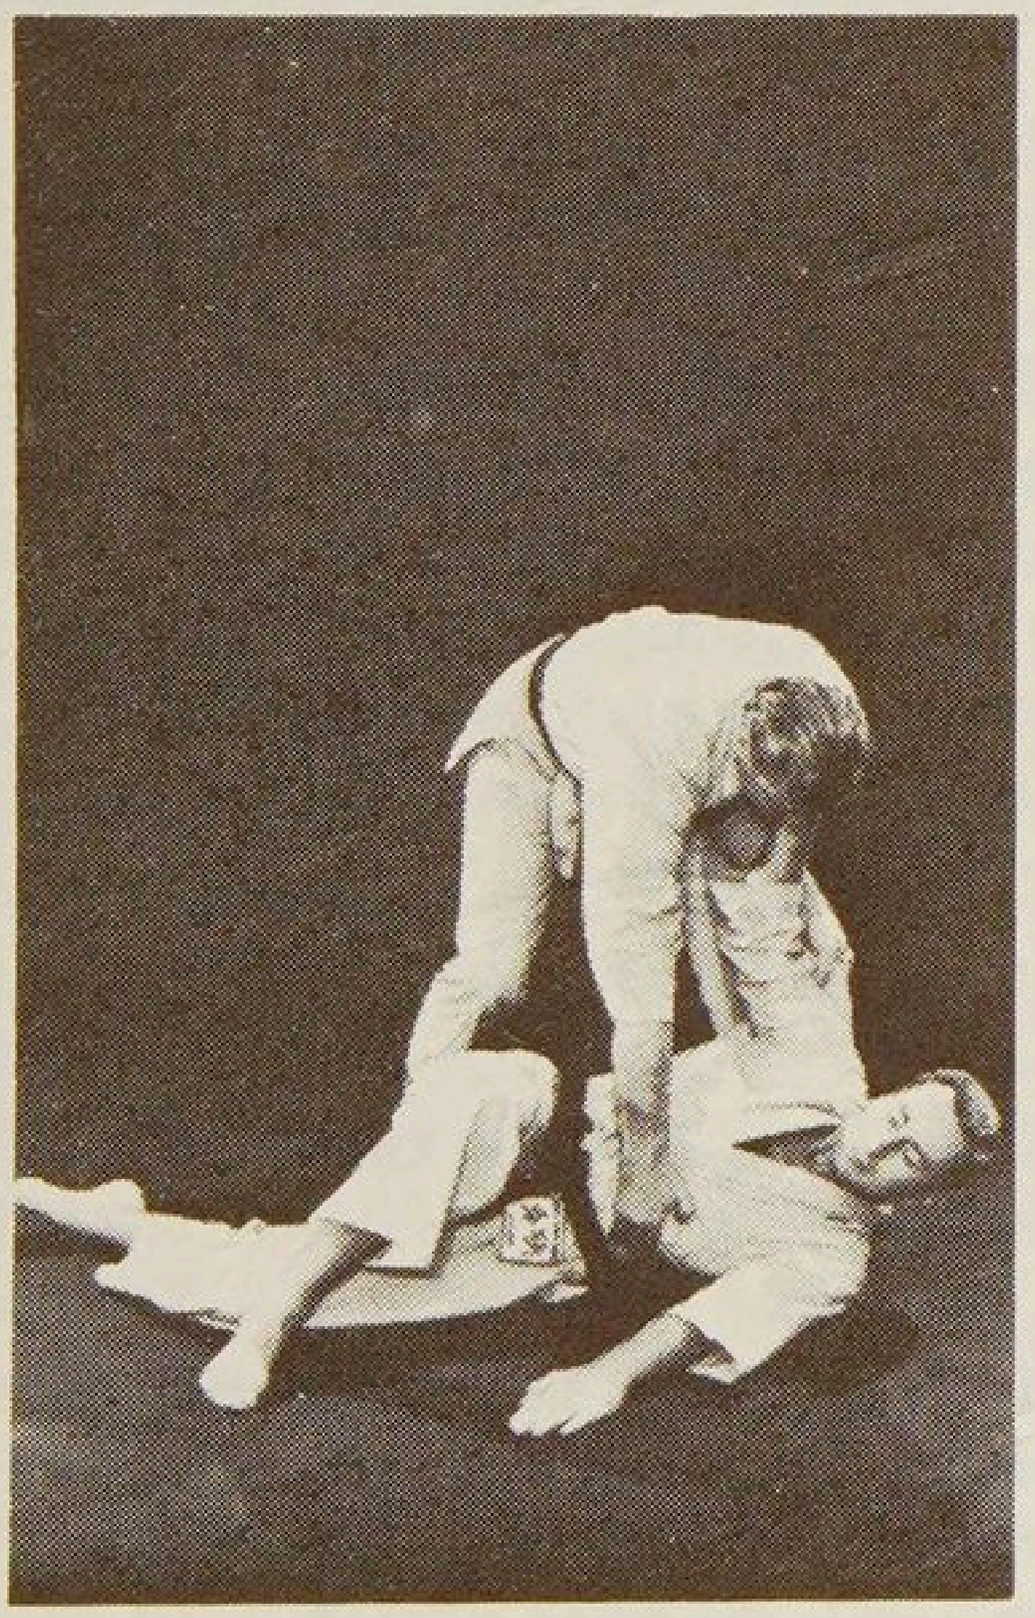
It is extremely unwise and dangerous to practice throwing techniques with someone who is evasive or secretive about the amount of training he has had. If he cannot be straightforward and honest about his training, it shows poor etiquette, lack of concern for your safety, and reflects poorly on his training and his teacher. Teachers who are sincerely interested in promoting the fair and sportsmanlike practice of the unarmed fighting arts will not encourage lying about amount and type of training. It is dishonorable and unsafe to be anything but utterly honest in your relationship with other students.

59. Among the instructions for beginning throwing practice, carefully observe the "easing down" practice which is essential when working with students who are just beginning to learn how to be thrown.

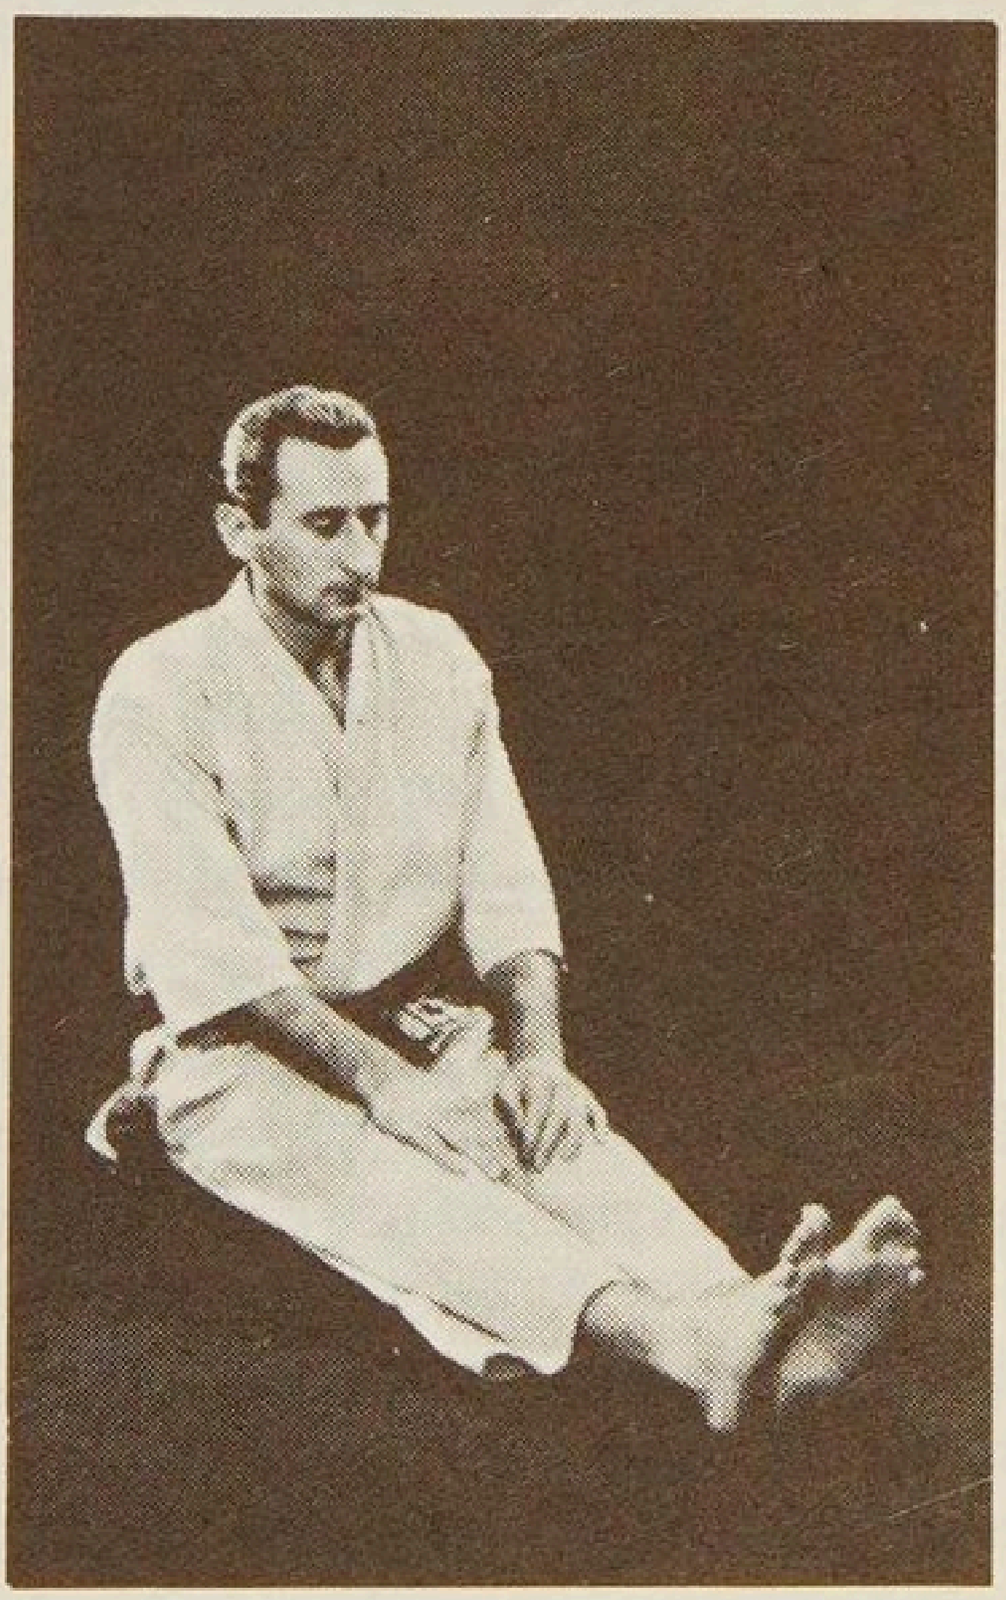
For advanced self-defense and for achieving the ranks up to brown ——advanced degree, it is not required that you learn how to be thrown although you will be required to demonstrate basic falls.

It is very useful to learn the falls properly for these reasons: Proper falling is a safety factor. If you are pushed down, or trip or slip, falling in the proper way can save you from injury. Falling practice is very good as an exercise. Finally, if you fall well and properly, you can practice the throws much more efficiently and enjoyably. Once you have learned good falling procedures, you will practice throws without the rigid or tense feeling that results from fear of falling.

59



60



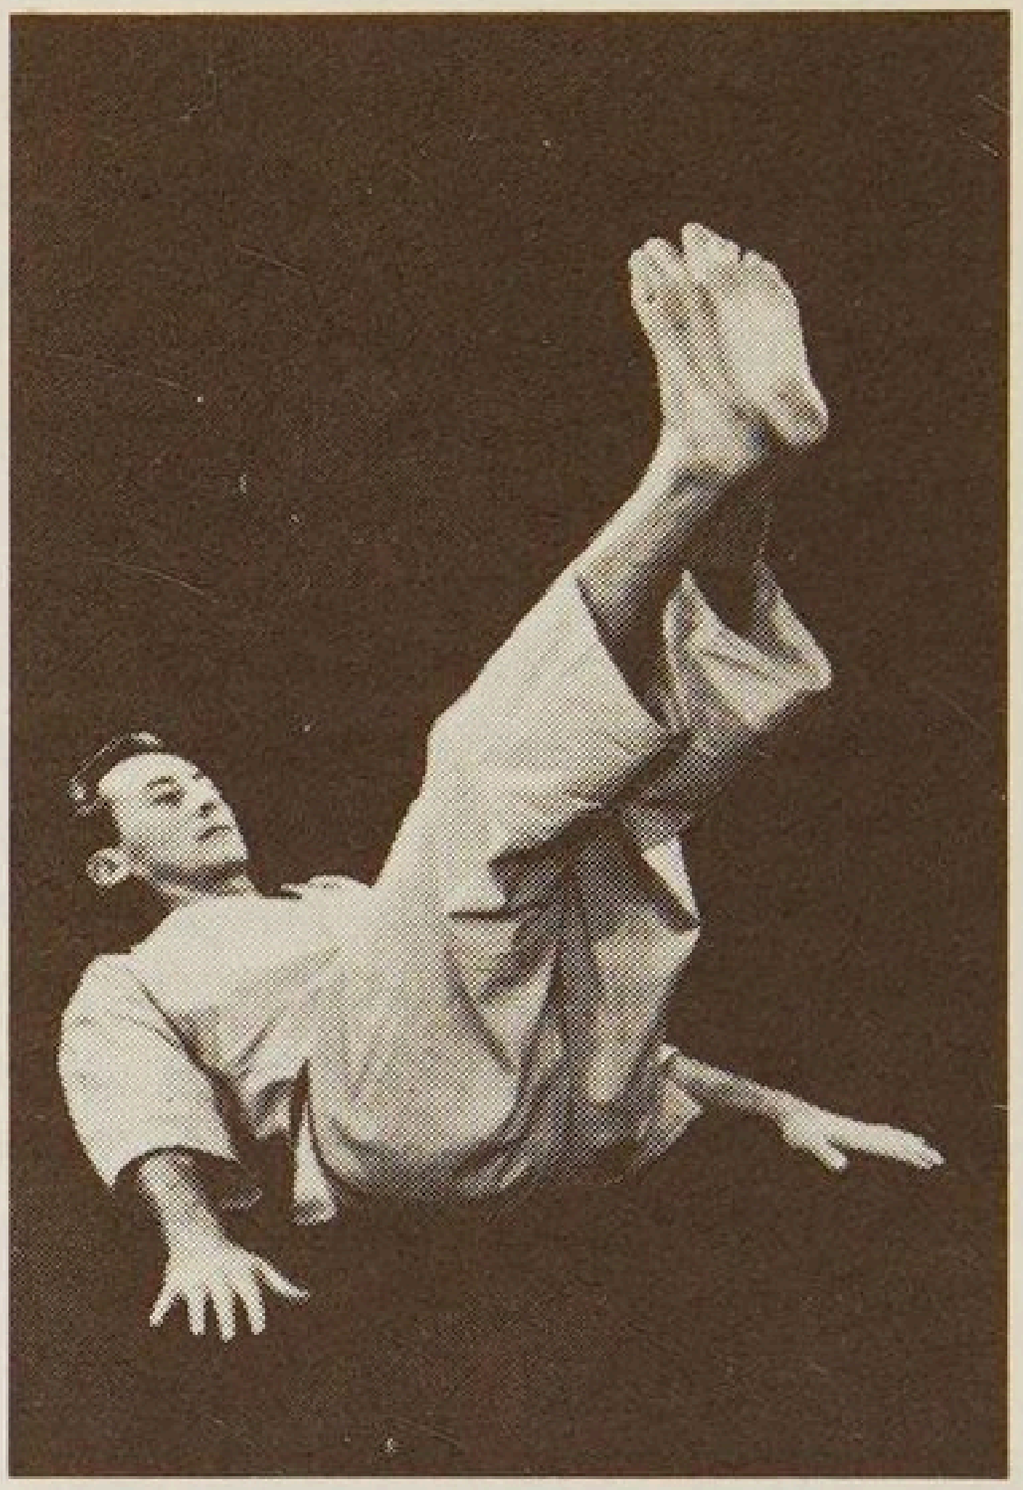
SAFETY FALLS

Basic Back Fall

60. Start from relaxed seated position on the mat.

61

62



61. As you raise your arms, fall backward but do not thrust or jerk your body. This is a slow, losing-your-balance, rolling action.

62. Just before the small of your back touches the mat, slap the mat vigorously with both hands, keeping your arms fairly close to your body; hands are slightly cupped. Your head never touches the mat. Slapping vigorously and at the proper time absorbs much of the impact of the fall and protects your back and internal organs. Check to make sure your head is tilted well forward. Roll to a seated position and repeat the fall five or six times.

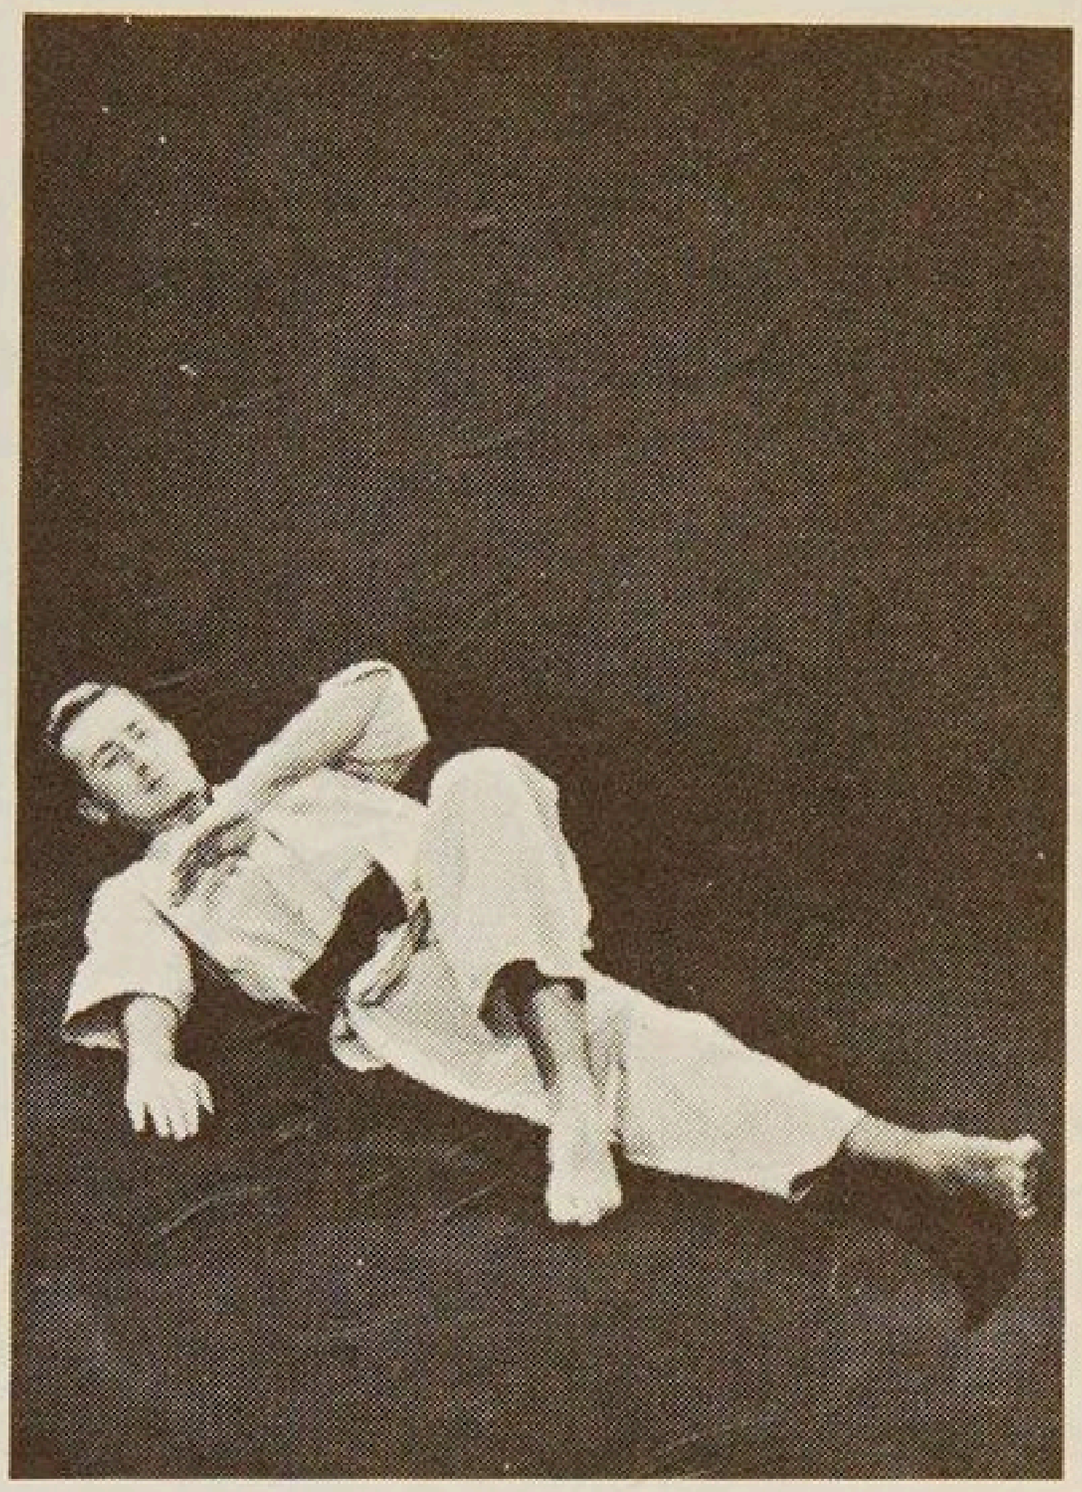
Basic Side Fall

63. Start from a lying down position; your head is off the mat, your arms crossed in front of you as shown.

64. Keeping your head off the mat throughout, roll from side to side. As you roll onto your right side, slap the mat vigorously with your right hand and simultaneously with the bottom of your left foot. As you roll to your left side, slap the mat with left hand and right foot. When you begin the practice of this fall, you may be confused by the left-rignt alternation of hands and feet. This is a very common problem with all new students and you must not be discouraged or feel that you are badly coordinated. With slow and proper practice, you will learn to use right-left hands and feet in the correct manner. This is a good coordination exercise for those whose coordination does happen to be poor. Do this fall from side to side, six times to each side.

63

64



These two basic falls are the foundation for other, more advanced falls; they are also an excellent warm-up exercise.

BREATH CONTROL FOR POWER CONCENTRATION

The human body has far more power potential than is normally put to use and for that reason most people are not even aware of that power reserve. There is hardly ever any reason for using all of the possible strength and power which we are capable of delivering. Far more important than power, of course, is the development of skill, speed, and use of good techniques. Even so, you will feel more confident if you realize your power potential and if you train to use it to the best advantage. Breath control has the function of concentrating and utilizing power to the greatest degree possible.

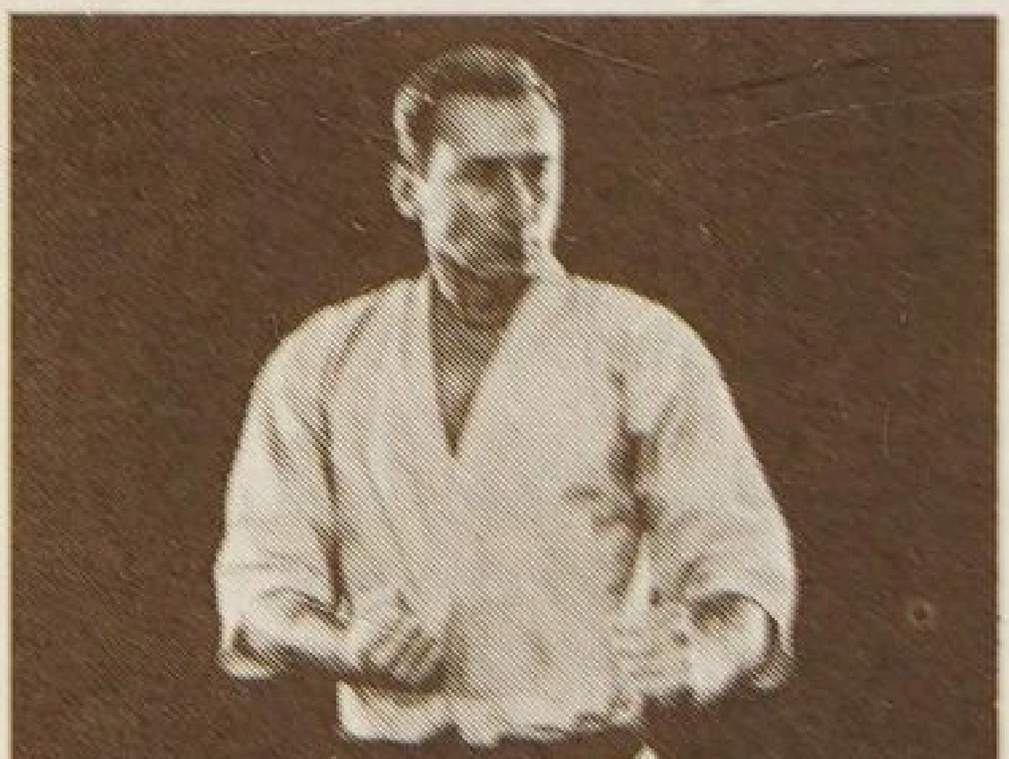
As the brain is the seat of mental power, the abdominal area is the seat of physical power. Without conscious planning, you automatically tighten your abdomen for a surge of power when you are doing heavy lifting or pushing. The procedure is this: You take a breath, tighten your abdomen, and exhale sharply at the instant of critical action. Sometimes this is done with a silent exhalation but more often it is done with a sound or grunt. This is unconscious breath control and you can put the same principle to work for you consciously by practicing your hand and foot blows with breath control.

Whether you are practicing hand blows or kicks, the procedure is the same.

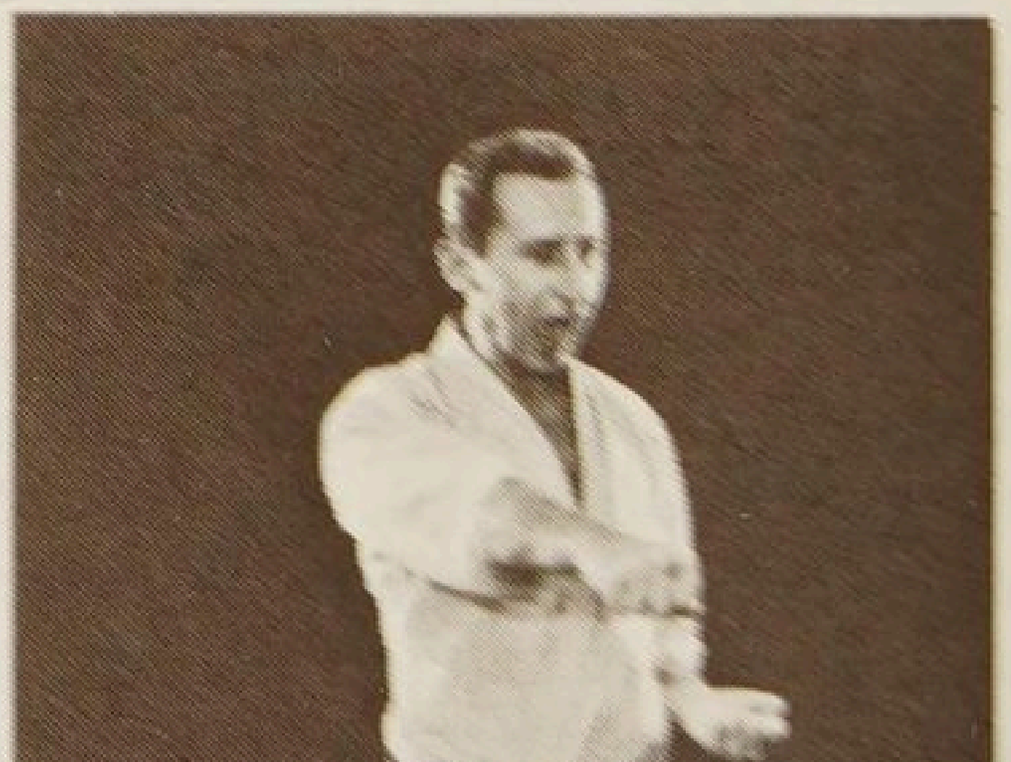
65. As you prepare to deliver the blow, inhale sharply, and deliberately tighten your abdomen.

66. As the blow is delivered, exhale the breath, keeping your abdomen tight. Consciously direct full energy into the single action of the blow, concentrating your power into the smallest area you can. As you exhale, you should yell or make a sound such as "huh," "hut," "hi," or any sound which seems a natural accompaniment to the expelled breath. If you make this a regular habit, it will greatly improve your technique. There are two other functions of the sounded breath: One is the fact that a yell or unexpected sound will startle and confuse an adversary in combat or contest. The second value of the sound or yell is that it gives you an appearance of courage which will reflect itself in an actual increase of inner courage. Since others respond to the outward impression we make, an outward behavior which implies determination will result in a suitable response from your opponent.

65



66



DISTRACTION AND FEINTING

In free-style practice and for practical self-defense, it is extremely useful to distract and to make feinting movements. An advantage you can gain over an adversary, even if it is a tiny instant of advantage, could give you a precious moment in which to apply your planned defense successfully.

Both distraction and feinting have the same purpose — to take your opponent's mind off his intended attack for an instant and make him react in a way which renders him more vulnerable to your action. Here are only a few examples of how to distract and feint. Generally, if you plan to kick, you should fake a hand blow or motion; if you plan to hit with your hand, fake a kick. Yelling can be used in conjunction with any of the three types of distraction and feinting shown here.

67. You plan a kick; distract him by faking a hand blow.

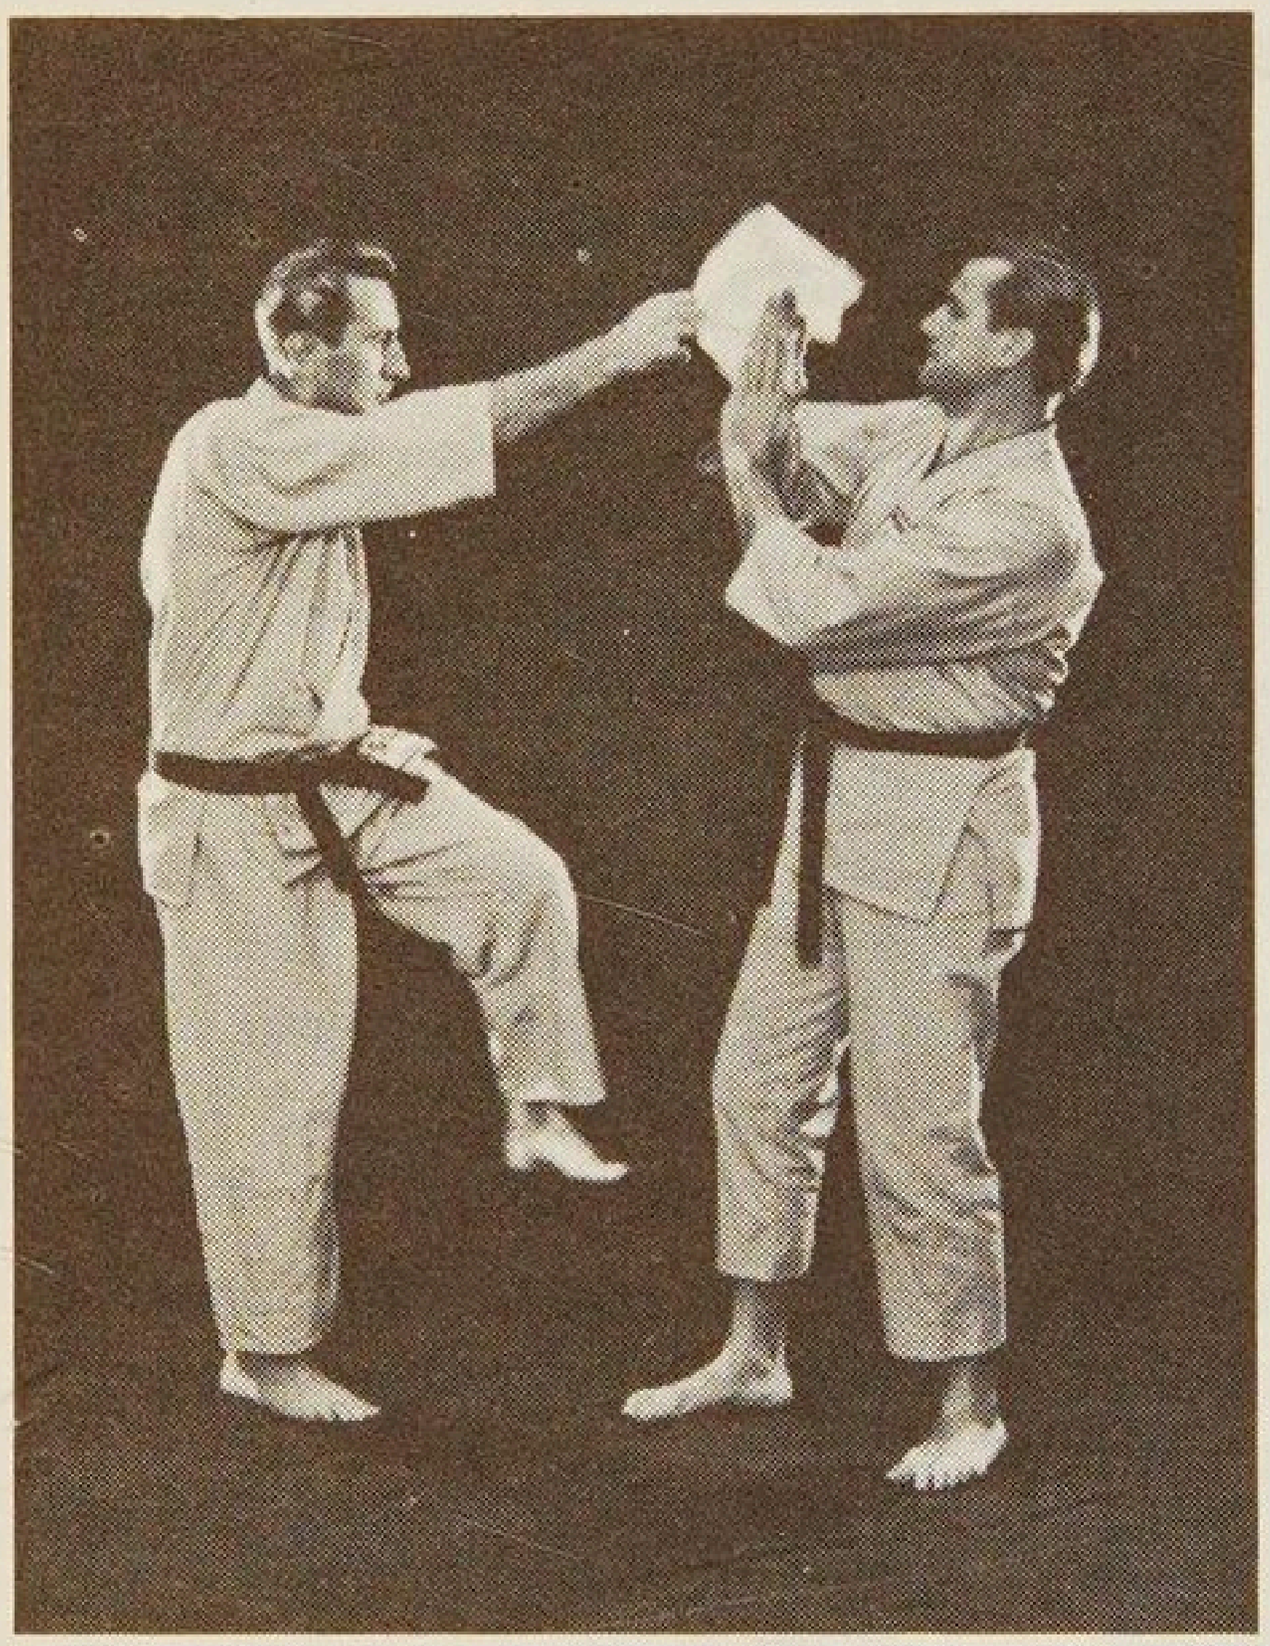
68. You plan a punch, feint with a kick. In both these cases, the timing is important. The feinting or faking action should be just an instant before you deliver the real blow.

67

68

69. Another type of feinting action is to throw something. It does not matter what you throw as long as it startles or distracts your adversary and takes his attention away from your planned action.

69



HOW WHITE RANK (ONE STRIPE) IS AWARDED

There is no formal test for this preliminary grade; the instructor, at his discretion, evaluates the student and awards the one stripe when, in his opinion, the student is able to execute the basic techniques in this section and when he knows and uses the rules of safety.

BLUE RANK — BASIC DEGREE

How to Strike: Ten Basic Hand Blows
How to Kick: Ten Basic Foot Blows

Nerve Centers and Pressure Points
Vulnerable Areas of the Body
Front
Back
How to Avoid and Stop Attacks
Leaping
Dodge and Parry
Blocking
Holds and Locks: Basic Techniques
Holds and Locks (for Formal Demonstration)

On-Coming Fist Attack
Rear Body Grab — Under Arms
Club (or Stick) Defense: Over-Head Attack
Knife Attack: Defense Against Straight-In Thrust
Surprise Attack: Training for Response and Defense
Front
Rear
Give and Take Sparring
How to Take the Blue Rank Test

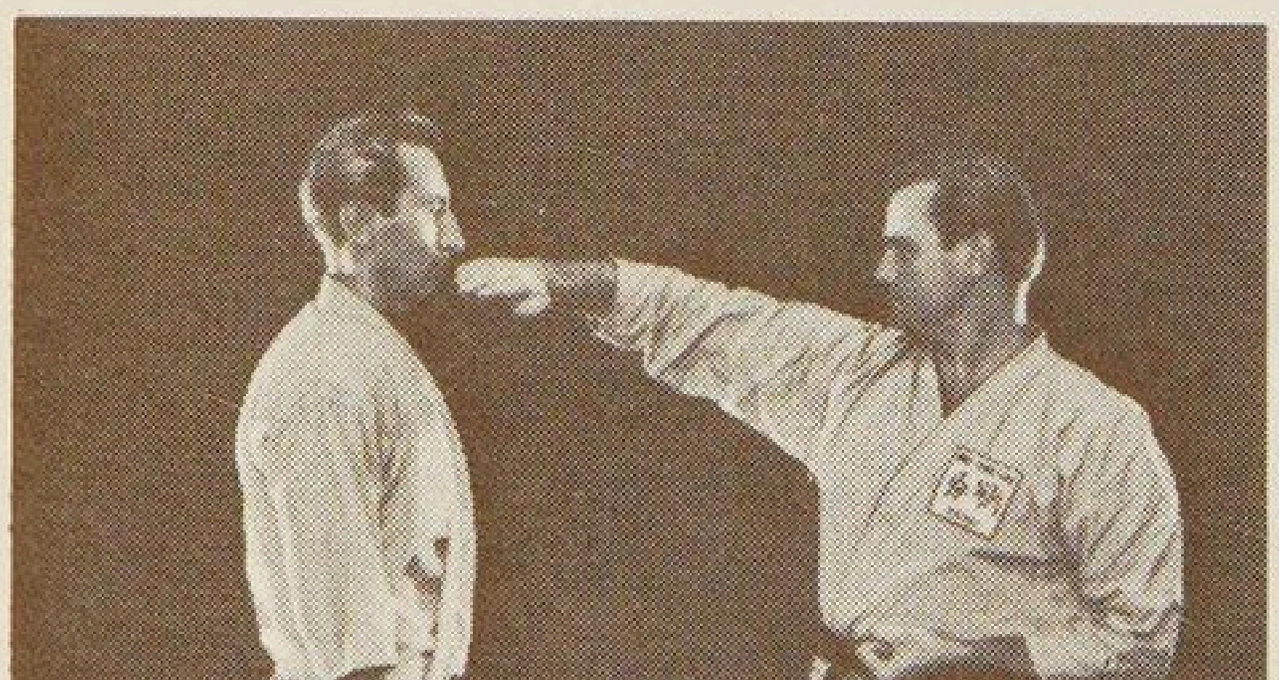
HOW TO STRIKE: Ten Basic Hand Blows

Practice Procedure: All hand blows should be practiced in several ways: You may use your partner for reference point (without making contact) so that you are practicing target application of the blow as well as its proper form; you may practice these blows by yourself, concentrating on quickness, vigor, and style; you should practice them against a padded surface for full force blows (see section which tells you how to improvise your own training aids); you should practice them against the swinging ball for precision; you should practice left- and right-handed blows to acquire versatility.

From the beginning, develop good practice habits. As you make each blow, inhale, tighten your abdomen, and then exhale and shout as you deliver the blow. When you are not practicing in a gym, you may need to make your shout almost silent, using the "huh" as you expel the breath. As forward moving blows are delivered, take a short step in to add body power. For rear blows, turn your head to see your target. Though you should practice to put your full strength into the hand blows, power is not your main objective; your main objective is speed, snap, and precision.

Edge of Hand Horizontal Blow — Palm Down

70. Snap and speed make this blow effective. The action is a whipping one. After completing the blow, the hand snaps back.



70

In other words, this is a blow in which there is no follow-through, but instead, recoil. When you can do this action very well, it is possible to extinguish a candle without coming closer than two inches to the flame. The speed of the action and the vacuum which results when the hand recoils will put out the flame. Mainly, the action is from the elbow to the fingers.

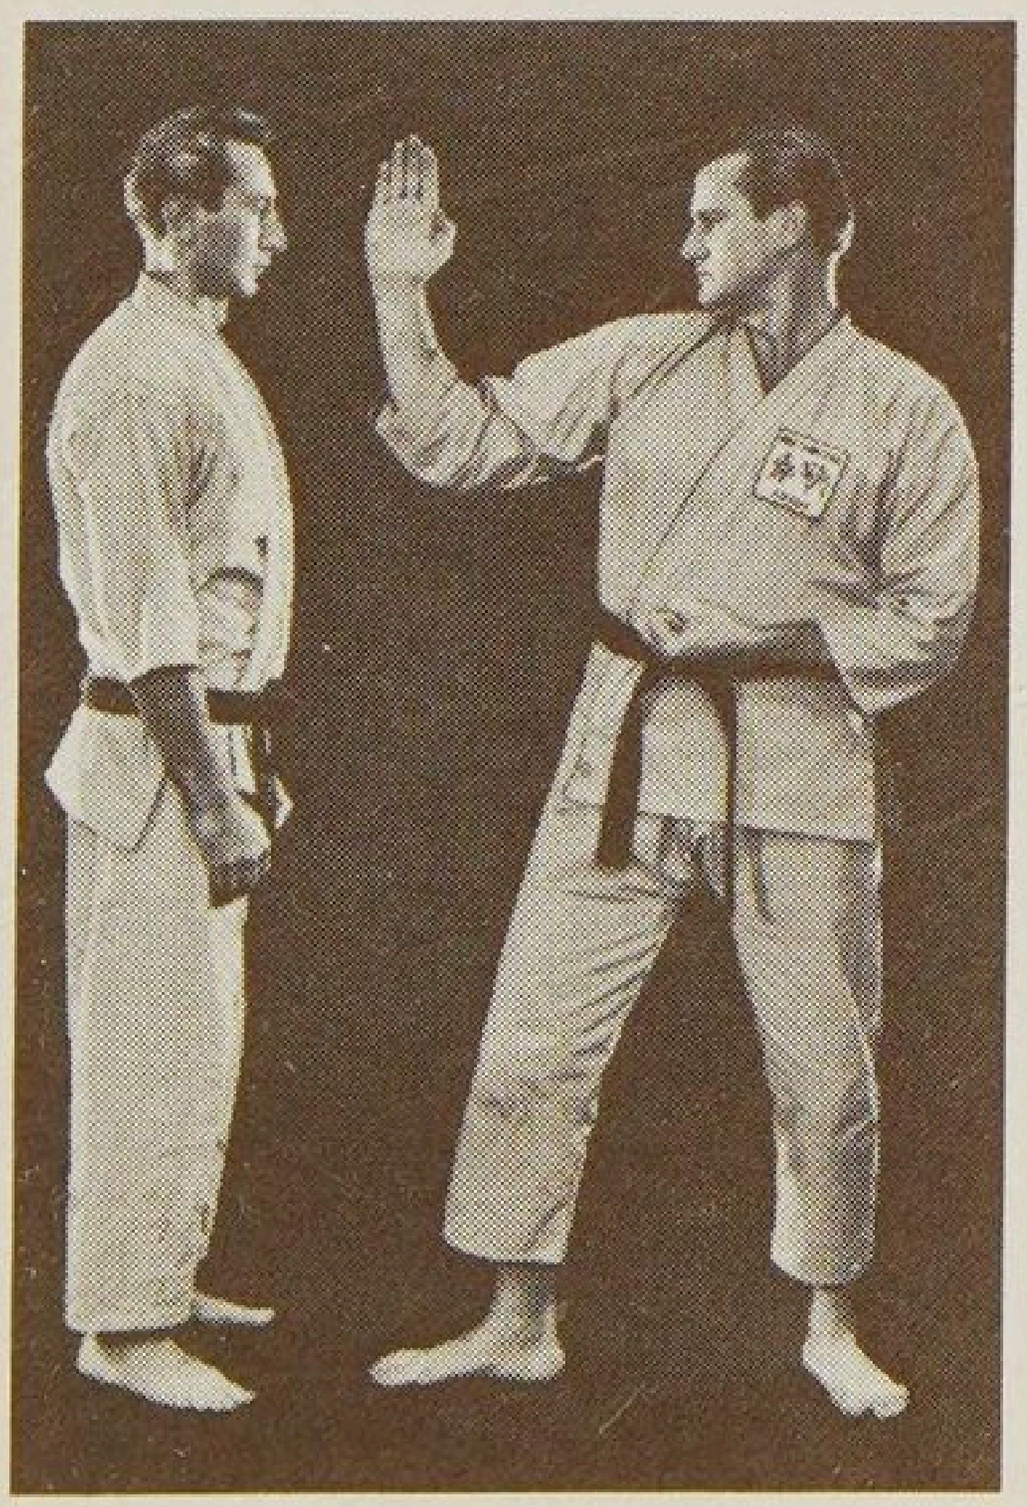
Edge of Hand — Vertical Blow

71. The direction of the blow is downward and the arm is bent at a right angle. From the snappy action of the blow there should be upward recoil.

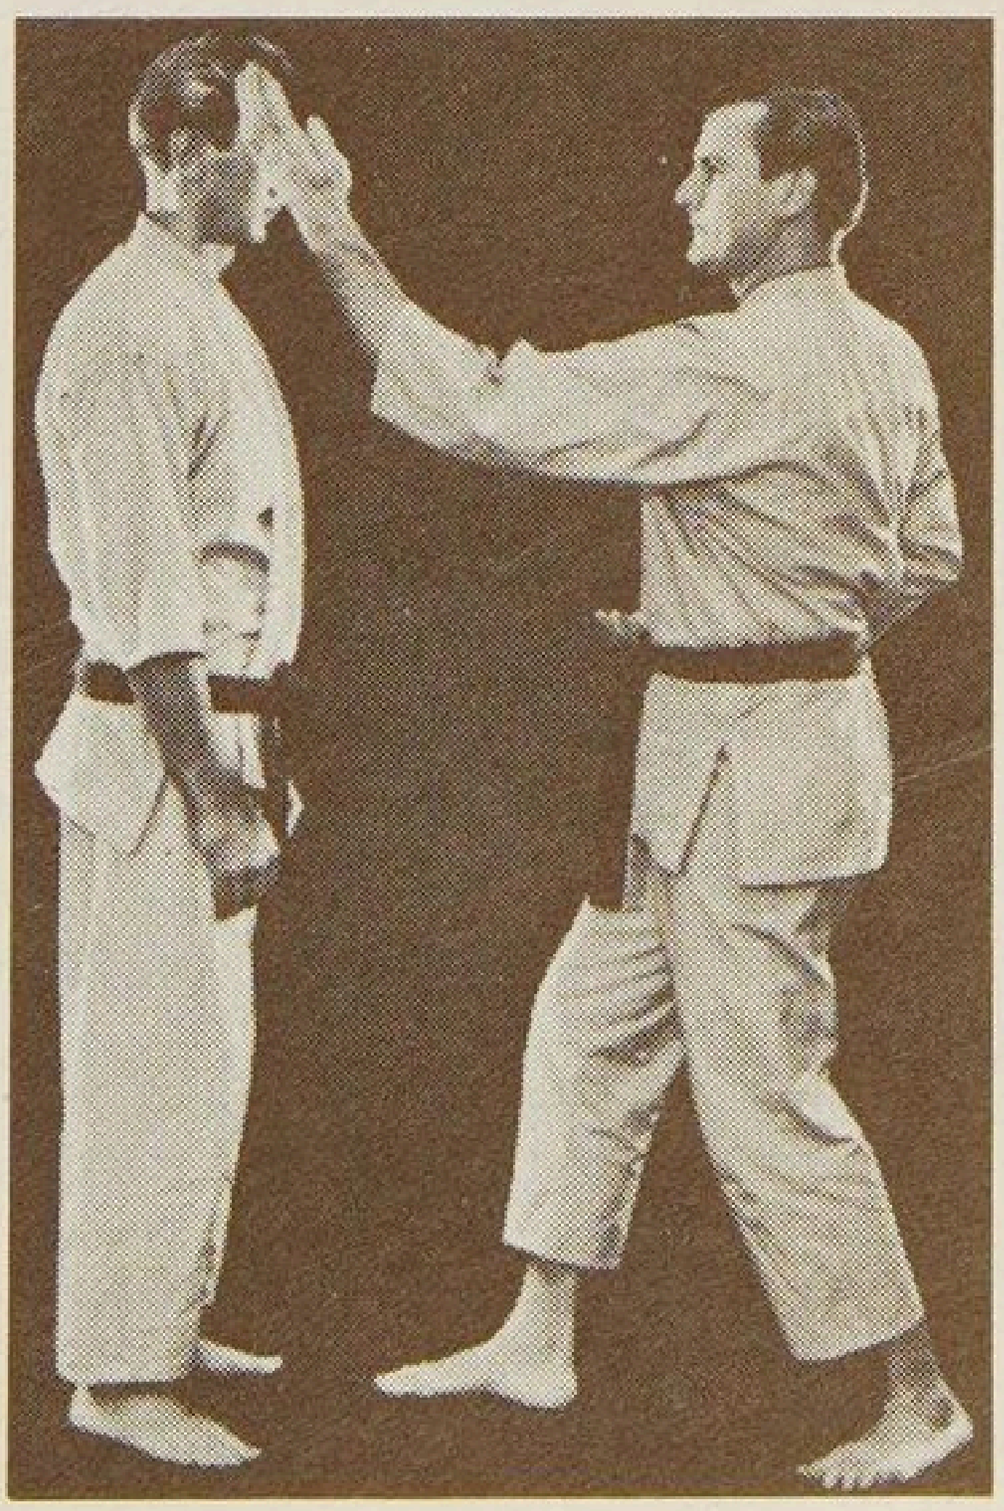
Edge of Hand — Palm Up

72. Though somewhat awkward for the beginner to practice, this is a practical hand blow with many applications. Because of the circular motion used in delivering the blow, there is less recoil than in the two versions above. From a ready stance, practice striking with the edge of the hand, palm up, as shown, as though into the side of the neck or face.

71



72



Edge of Hand — High to Rear

73. With your target directly behind you, strike to the rear (as though into the face), turning your head to look at the point you are hitting. A whipping action of your upper body adds force to the blow. Palm is held down.

Edge of Hand — Low to Rear

74. Turning your head to see your target, snap back with a low edge of hand blow.

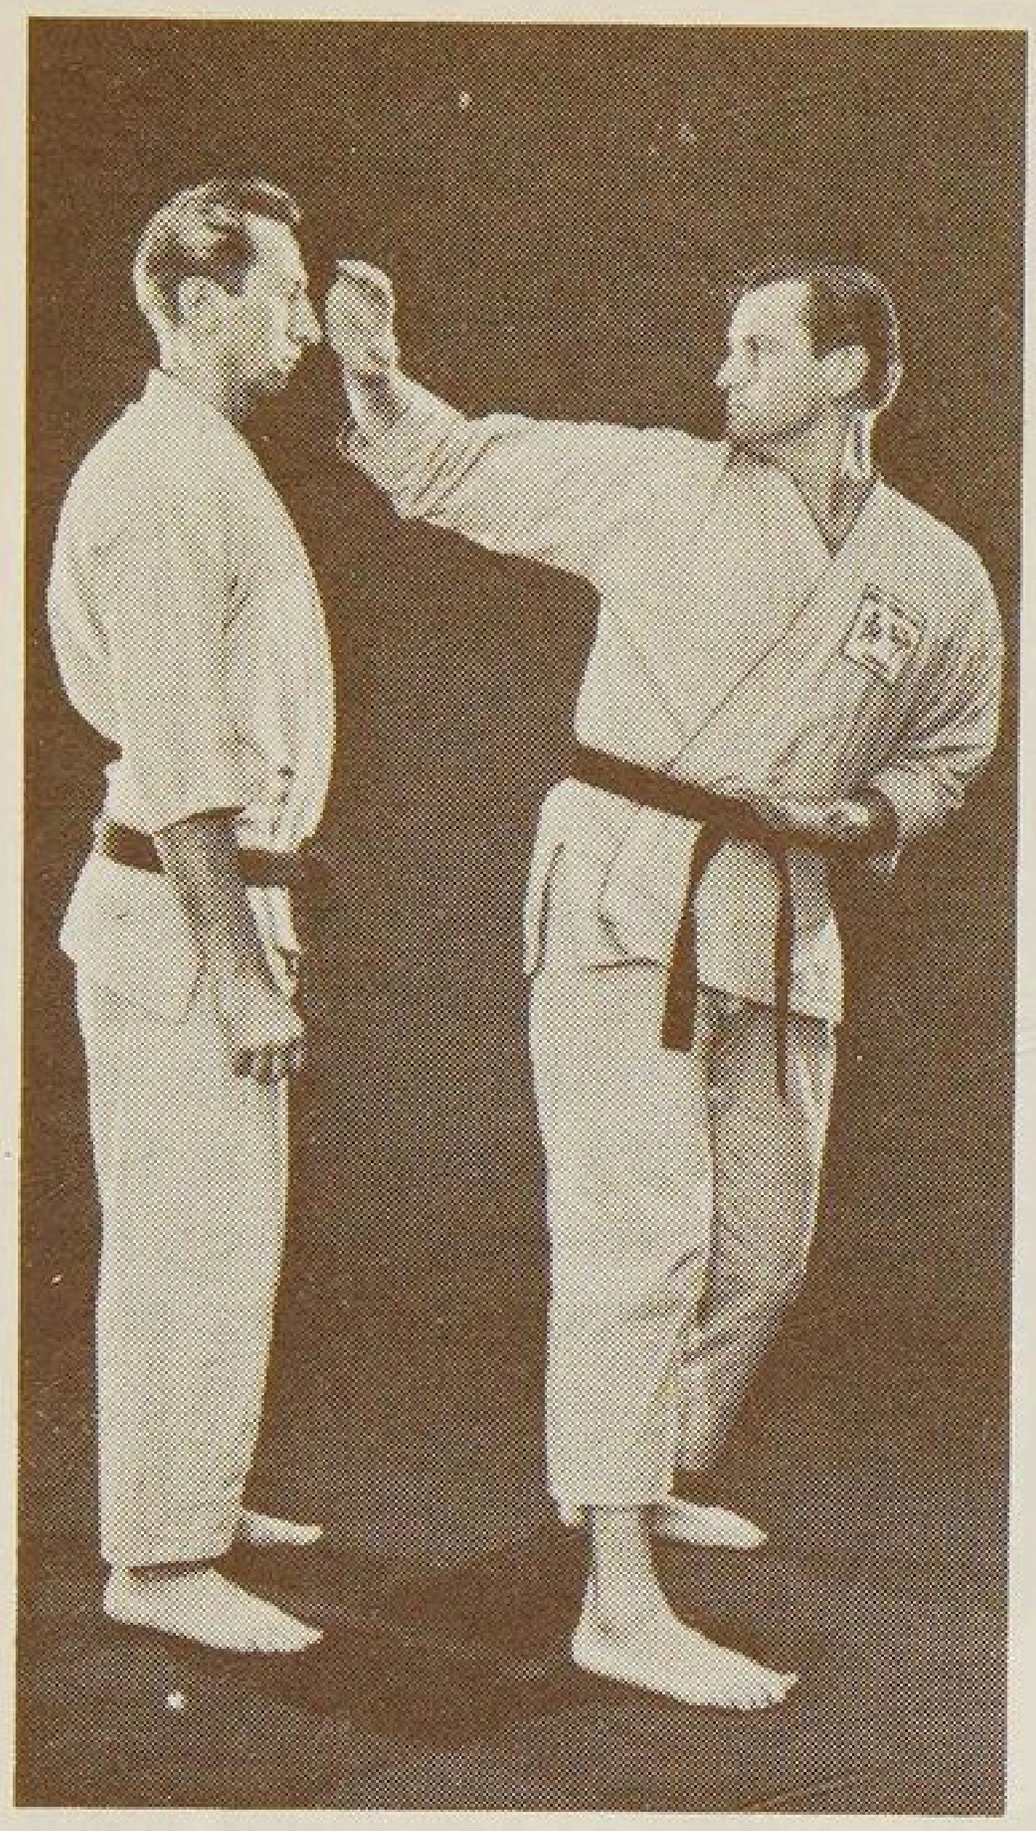
Cupped Hand Finger Stab

75. The cupped finger stab has a narrow range of applications but is extremly effective for close-range, serious attacks. The finger stab should not be used in any *except* serious attacks since the target areas are the eyes or throat. Finger stabs are ineffectual into bony parts of the body or those parts which are protected by muscle. Many years of practice and fingertip conditioning could make it possible for you to use finger stab blows more, but I do not recommend it when there are so many simpler, effective techniques available to you. The finger stabs are delivered in a thrusting, jabbing manner.

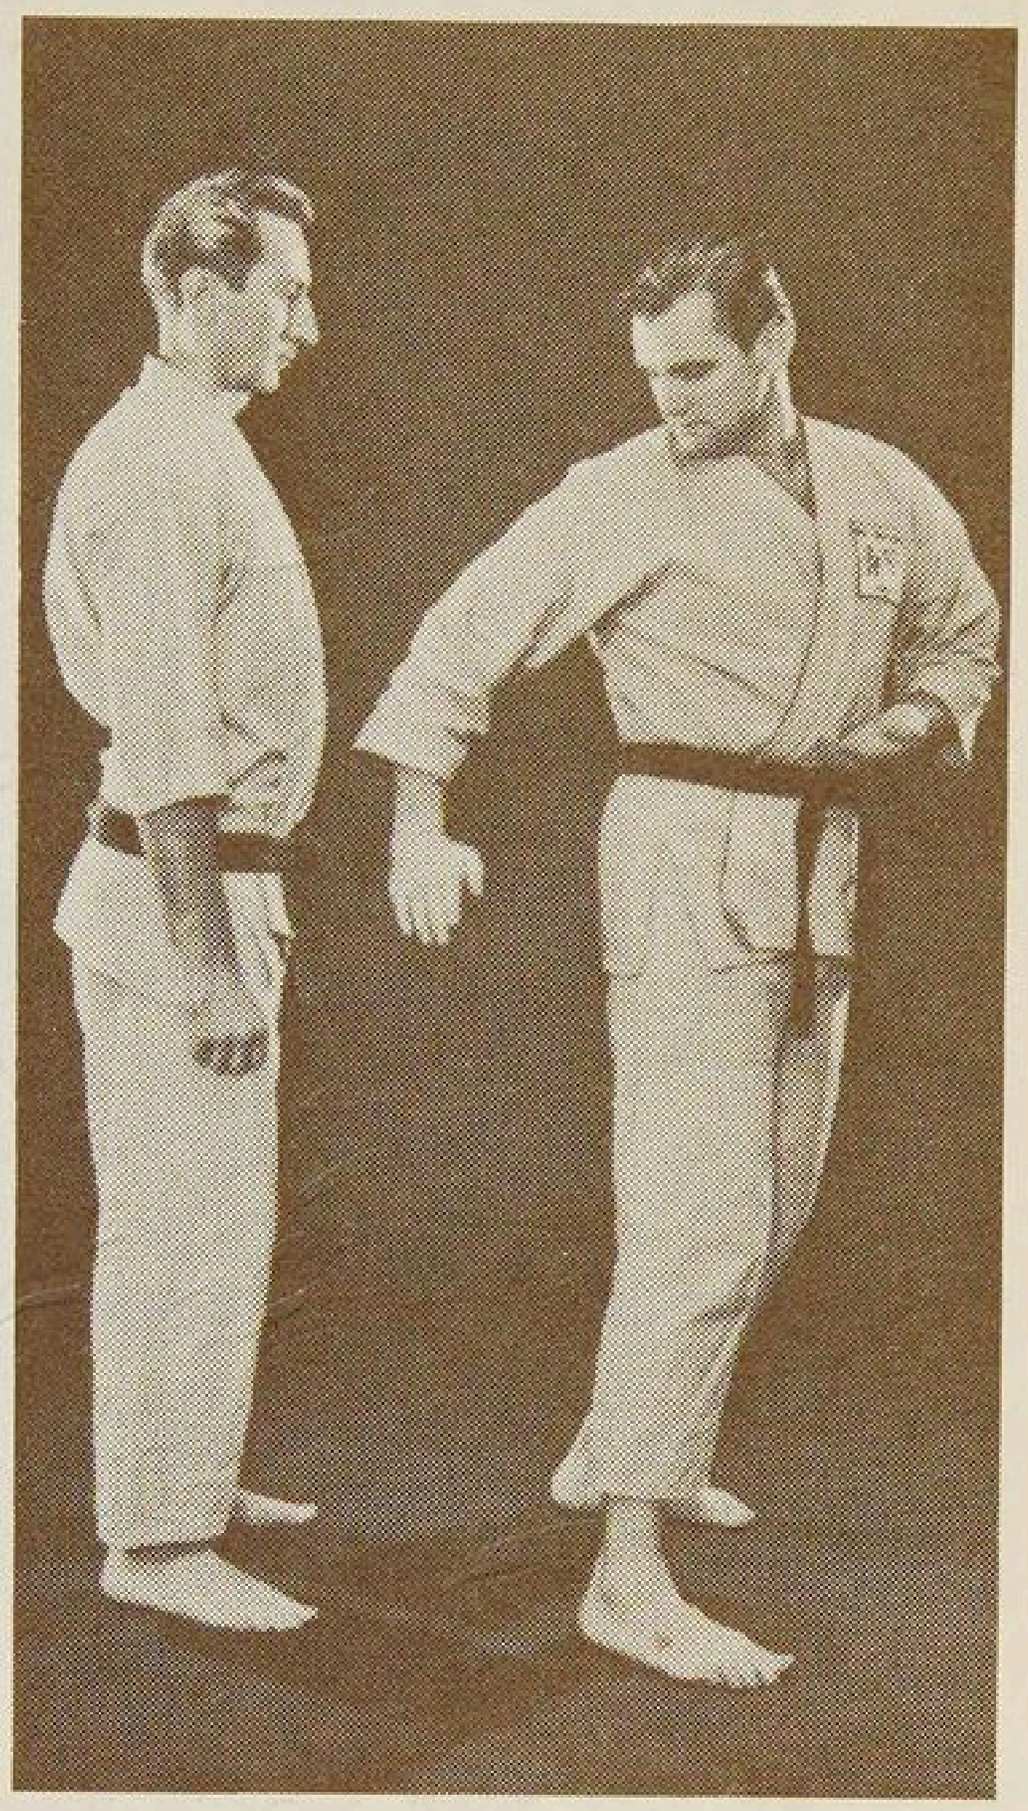
Heel of Palm

76. Though limited to a very few target areas, the heel of the palm blow is excellent, simple to learn and to apply. It is especially useful because it may be used effectively by a smaller person against a larger adversary. The action is a jerky, upward thrust. Use follow-through with this blow, because in actual defensive use you could topple your adversary backward and put him into very awkward balance, or even put him on the ground.

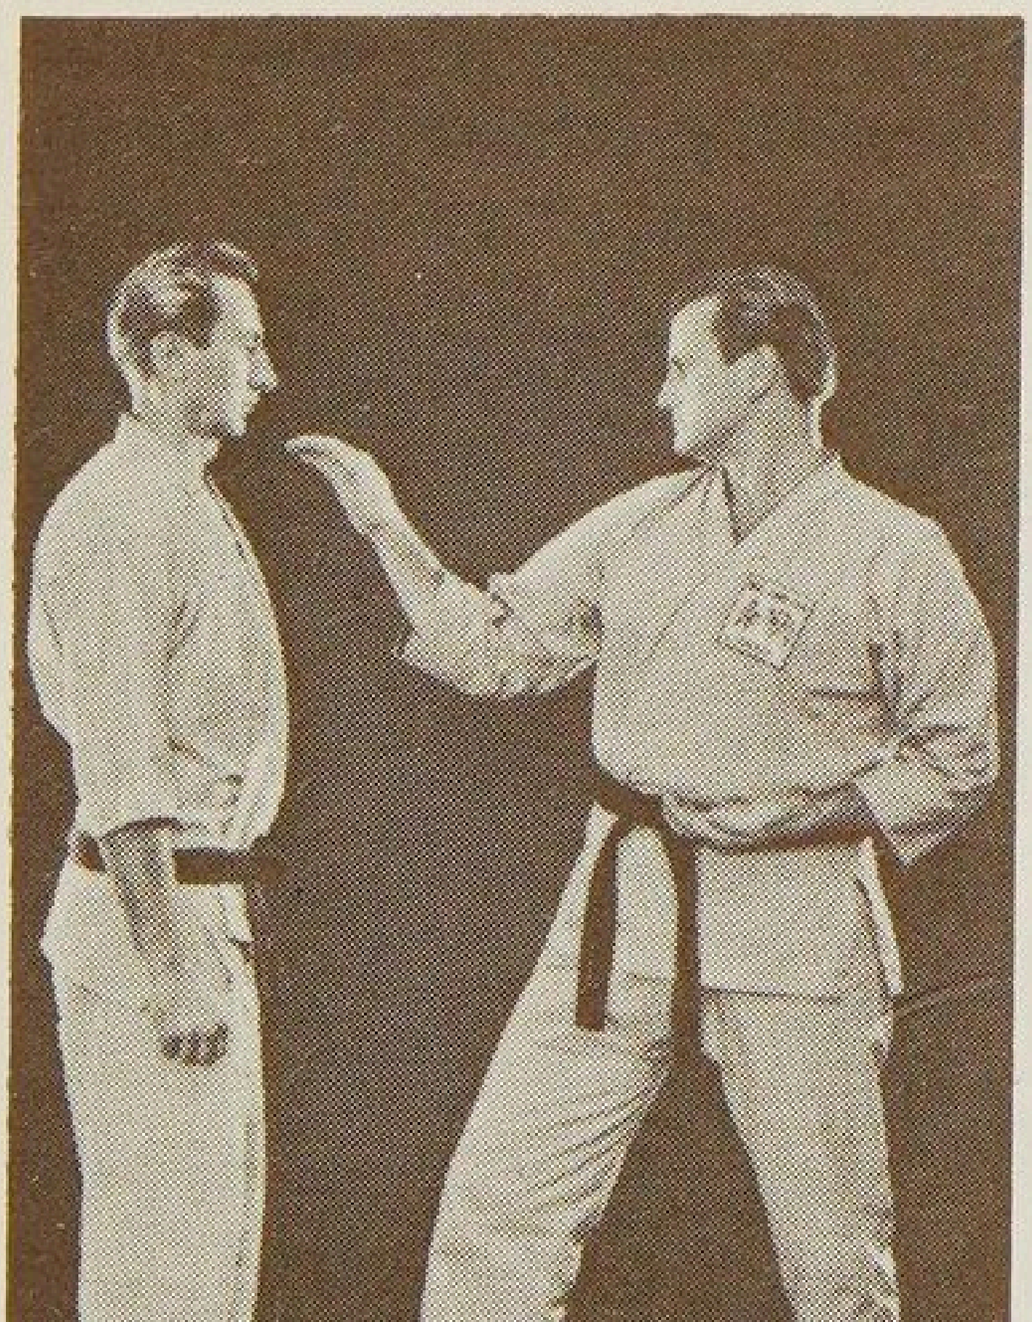
73



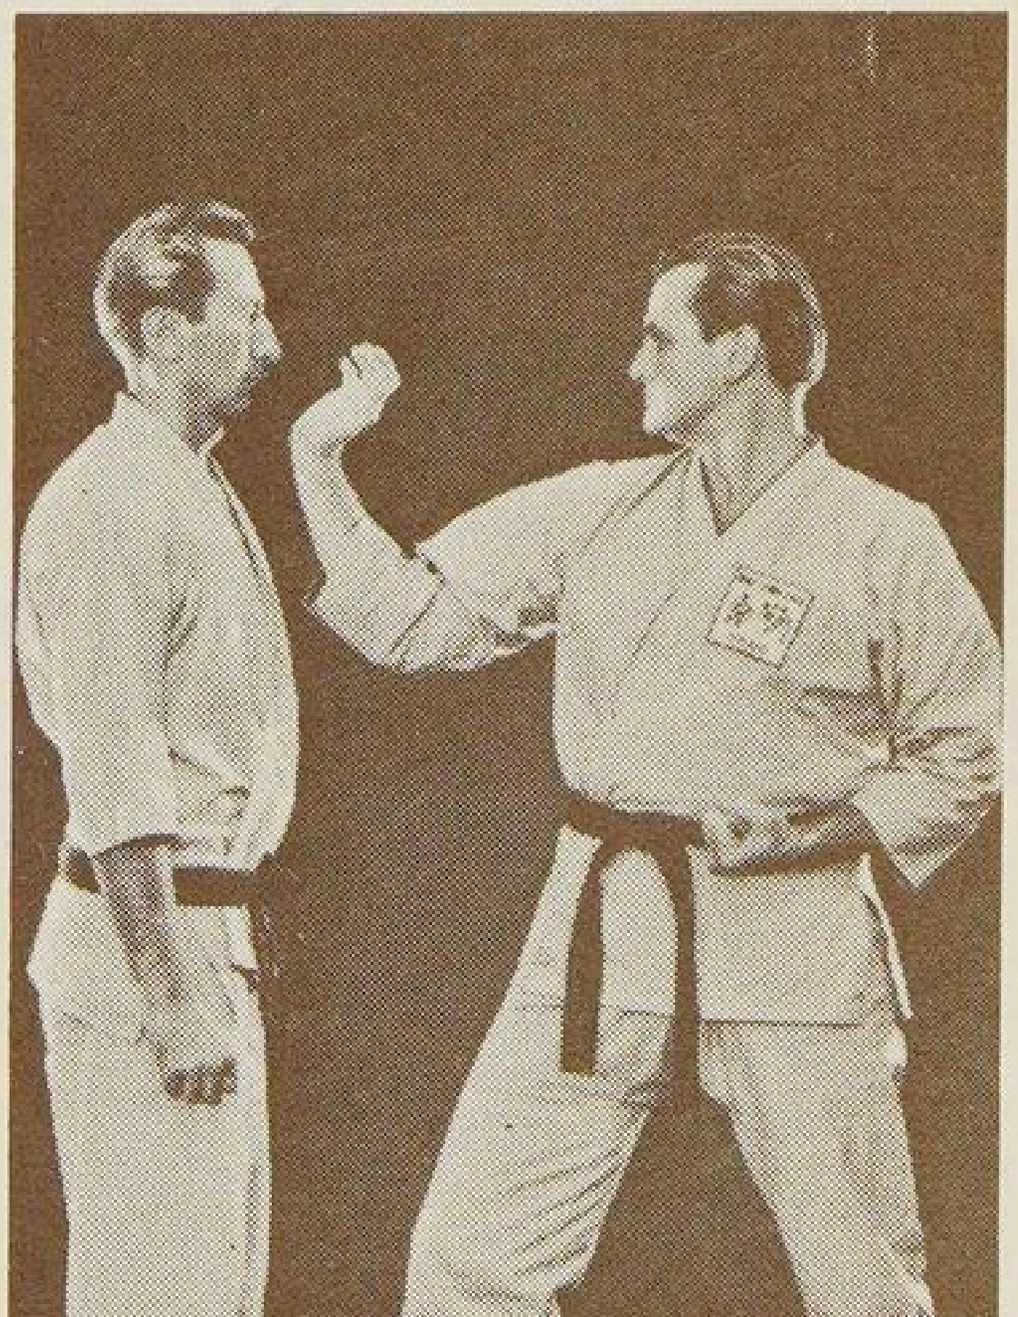
74



75



76



Foreknuckle Blow

77. With the extended foreknuckle, the action is in a straight line. There is a penetration effect when the knuckle is extended in this manner. The target area is soft areas of the body only. There is no recoil with this blow, the action is ramming, with follow-through for best results.

Side of Fist

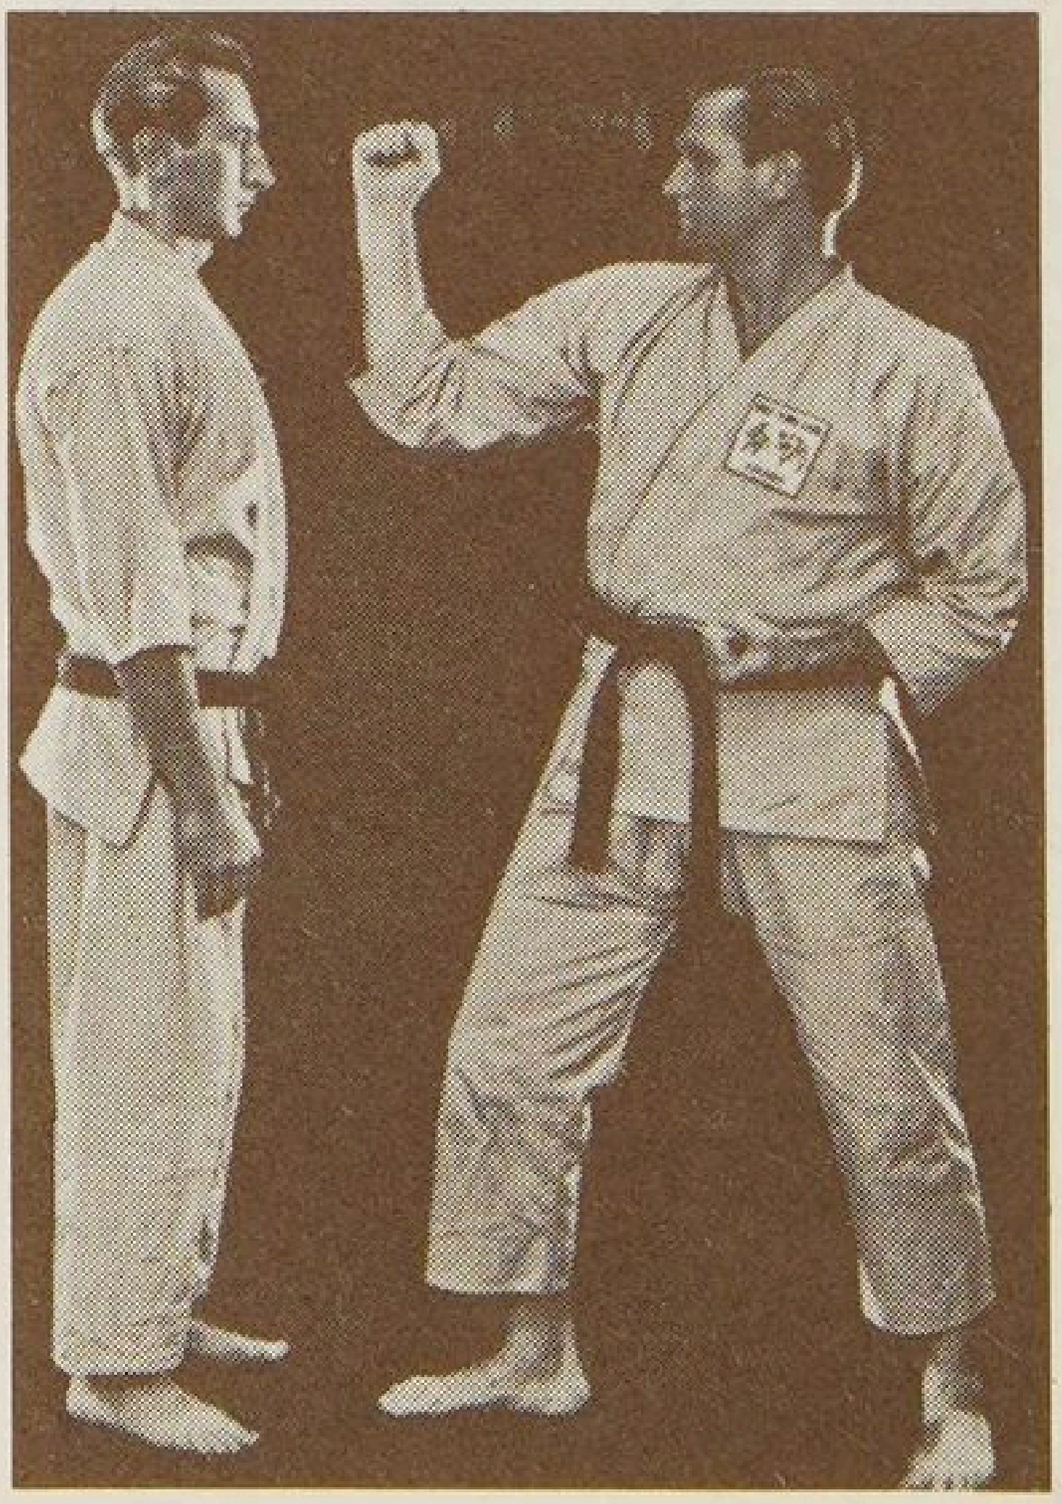
78. This is the traditional "hammer" blow, so-called because the action resembles the manner of striking with a hammer. It is a power blow, which limits its effectiveness for smaller people, but it is an easy, natural kind of blow to make. By practice of full-power blows, you can extend your possible range of use of this method of striking. Use snapping action, with recoil rather than follow-through.

Elbow — Straight Back

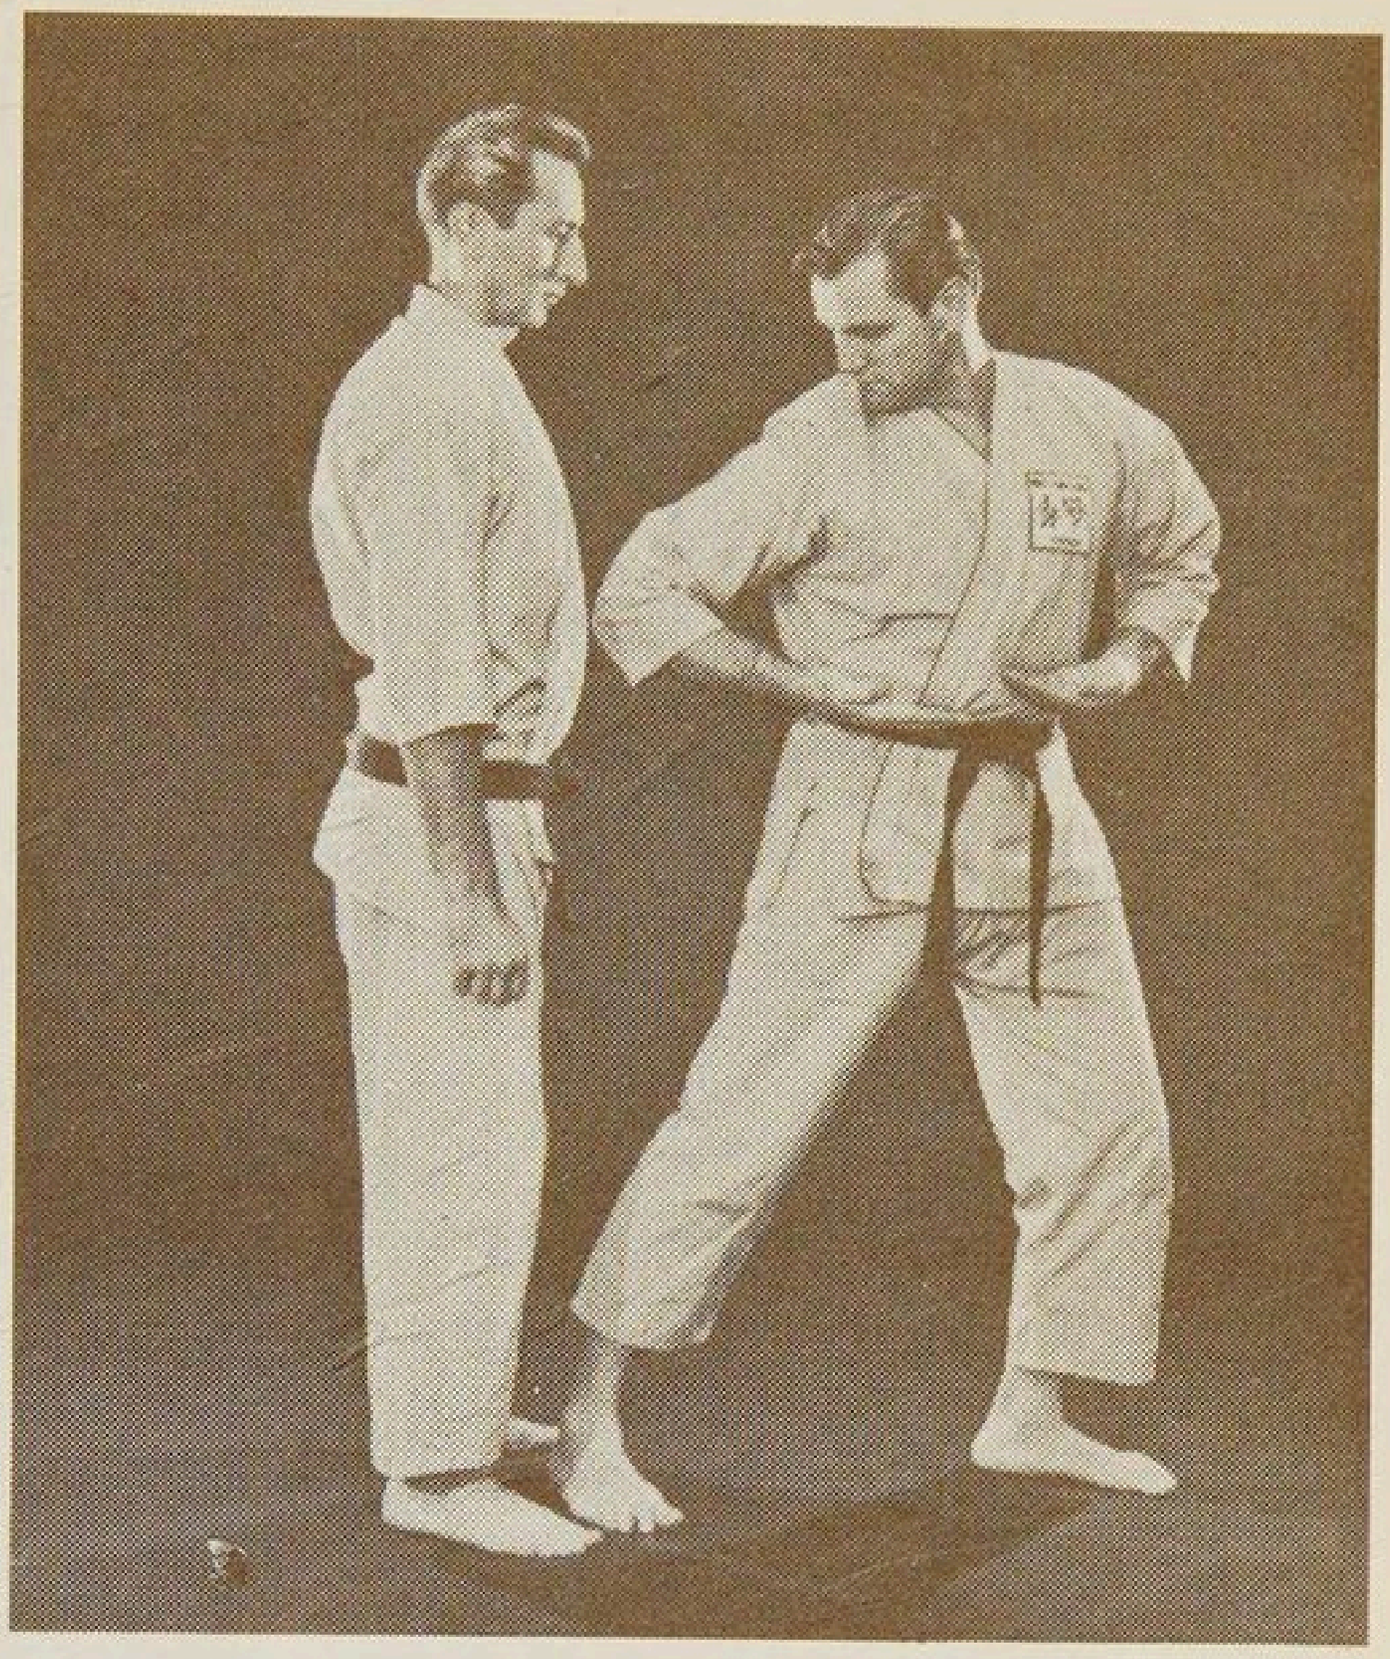
79. As you turn to see your target, deliver a ramming blow straight back to the rear. Hand can be open, with palm up, or closed fist, palm up. This is a very forceful blow, even when used by a slight person. Target area is usually the midsection.

77

78



79



HOW TO KICK: Ten Basic Foot Blows

Practice Procedure: All kicks should be practiced in several ways: With your partner for reference point (without making contact) so that you learn applications of the kicks; by yourself, for speed, style and vigor; kick against a training bag for full-power blows and against the swinging ball for precision, alternating left and right foot for versatility.

Kicking is more practical than hand blows because your leg is longer and stronger than your opponent's arm and you can kick your adversary without coming within range of his fist. With your shoes on, you actually have a weapon which is far superior to use of the fist. Finally, there is the element of surprise, a punch in the nose is expected but a kick into the knee is not. It takes only 60 pounds of pressure to break or dislocate a knee. In that condition your adversary is very unlikely to be able to fight. In addition to practicing the actual kicking techniques, you must, in order to extend your range of potential kicking ability, practice balance, agility, and flexibility exercises.

Although for practical use (based on my students' actual experience), the low kicks are best, the high kicks should be practiced equally, as they are splendid conditioning exercise; if you learn to kick properly at the higher areas, the low kicks become very simple to do.

Most practical of all is practice with your shoes on. Don't wear shoes when training with your partner, but only when you are practicing alone. Do all of the types of kicking practice wearing shoes.

For rear targets, turn your head to see what you are hitting. All kicks should be practiced with breath control. As you prepare to kick take a deep breath, tighten your abdomen; as the kick is delivered, expel your breath with the shout of "huh."

As you progress, you should practice all the kicks from a variety of stances; from the natural stance, T-stance, boxing stance, etc.

When beginning practice of the kicks, always return to your starting stance after delivering each kick. As you progress, you will be practicing combinations of kicks and your training should be directed toward quick succession of a variety of foot blows without unnecessary steps between the kicks and without the hesitation which occurs when you return to a fighting stance.

Ball of the Foot — Straight Out

80. First, draw your leg up and then thrust out. You must not make this a kick which starts from the floor, the essential action begins after the foot has been raised. For training practice with your partner (barefoot) kick with the ball of the foot; for training practice wearing shoes, kick with the toe for greater penetration power. The action is snappy, whipping, with immediate recoil.

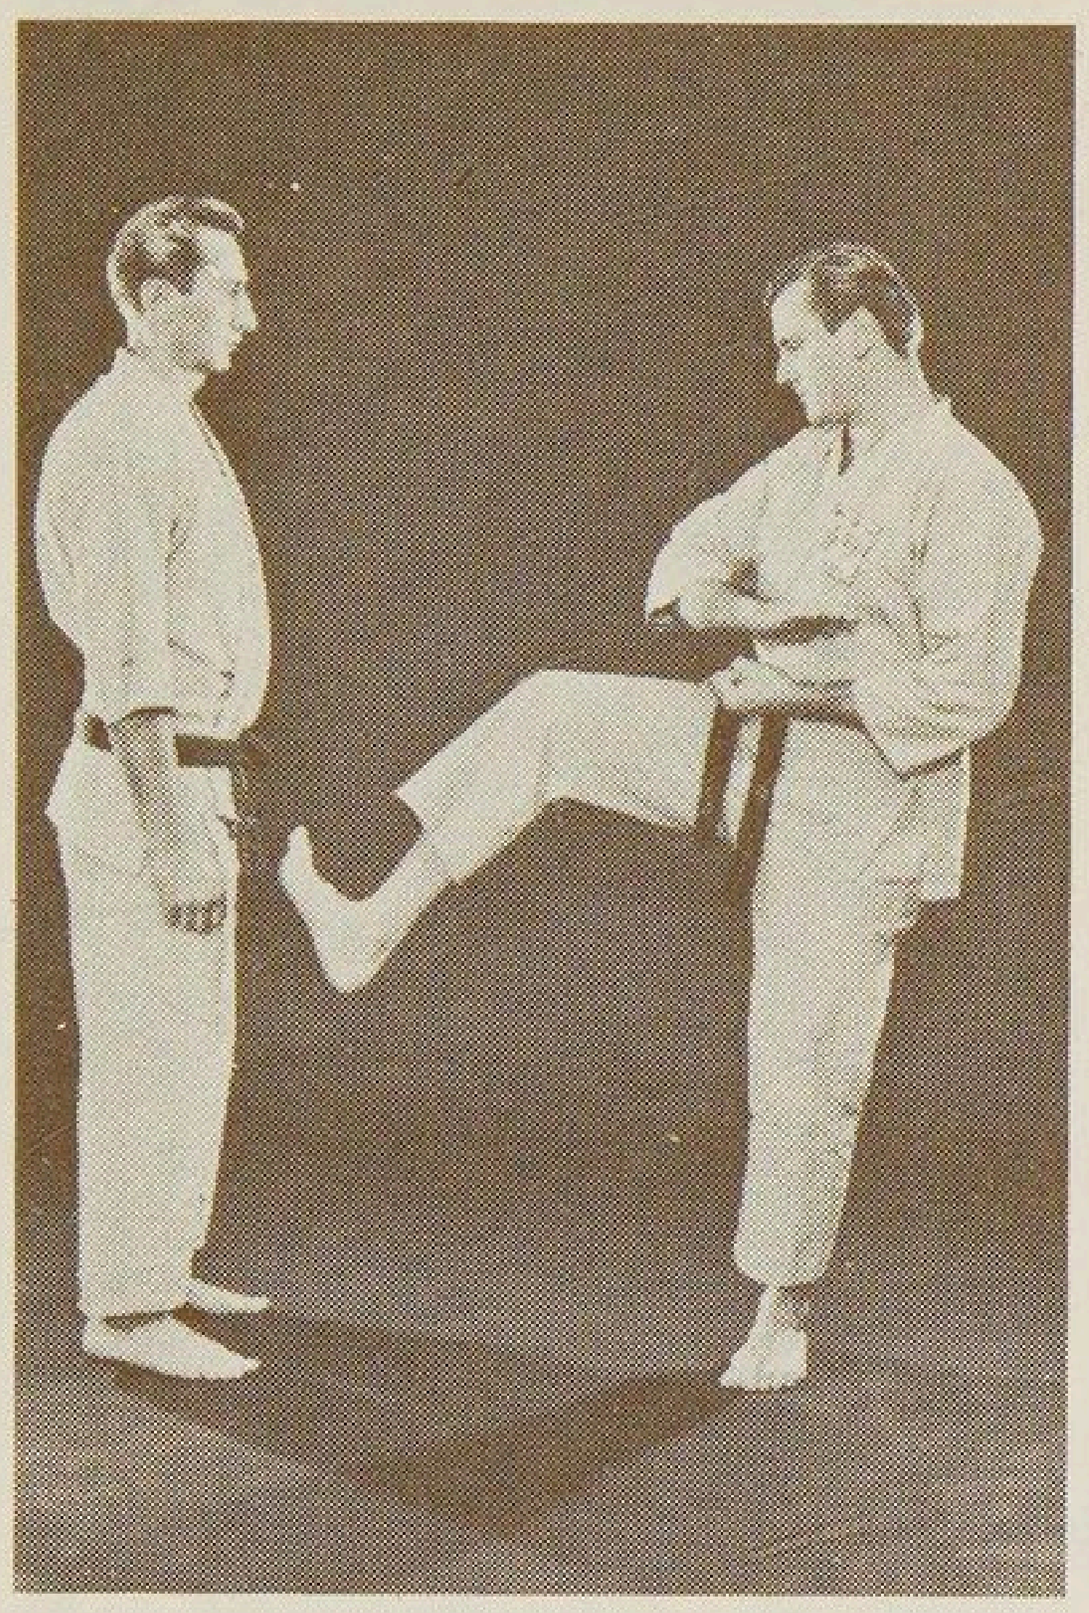
Bottom of Foot — Snap Kick to Front

81. From starting position, take a quarter turn with the non-kicking foot, draw your leg up under you, smash to the front with the bottom of the foot, preferably hitting the target with the heel. This kick is versatile because of the broad striking area; should you miss hitting exactly with the heel, the arch or even the ball of the foot will do. It is a smashing action. Recover to strong balance.

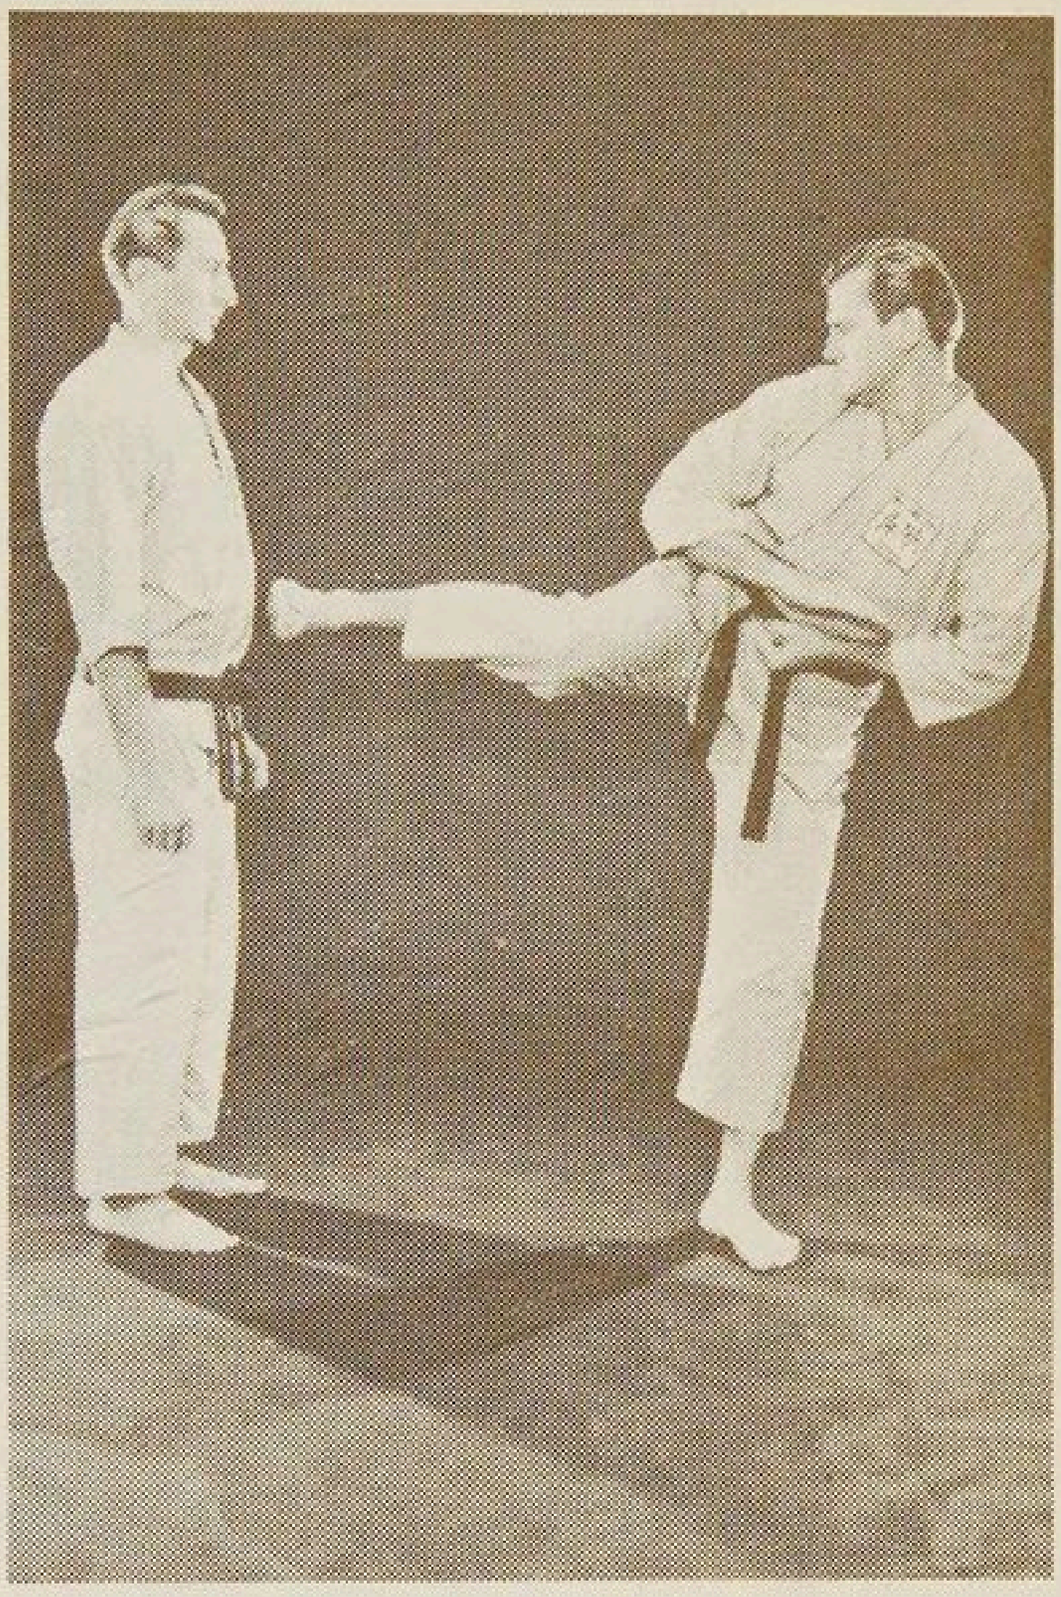
Edge of Foot — Snap Kick Forward

82. Make a quarter turn with the non-kicking foot, draw your leg up and thrust forward with the edge of the foot or shoe. Ankle flexibility is important for proper execution of this enormously effective blow. The difference between the preceding kick and this one is that the action here is cutting, penetrating, while the previous kick is pounding, smashing.

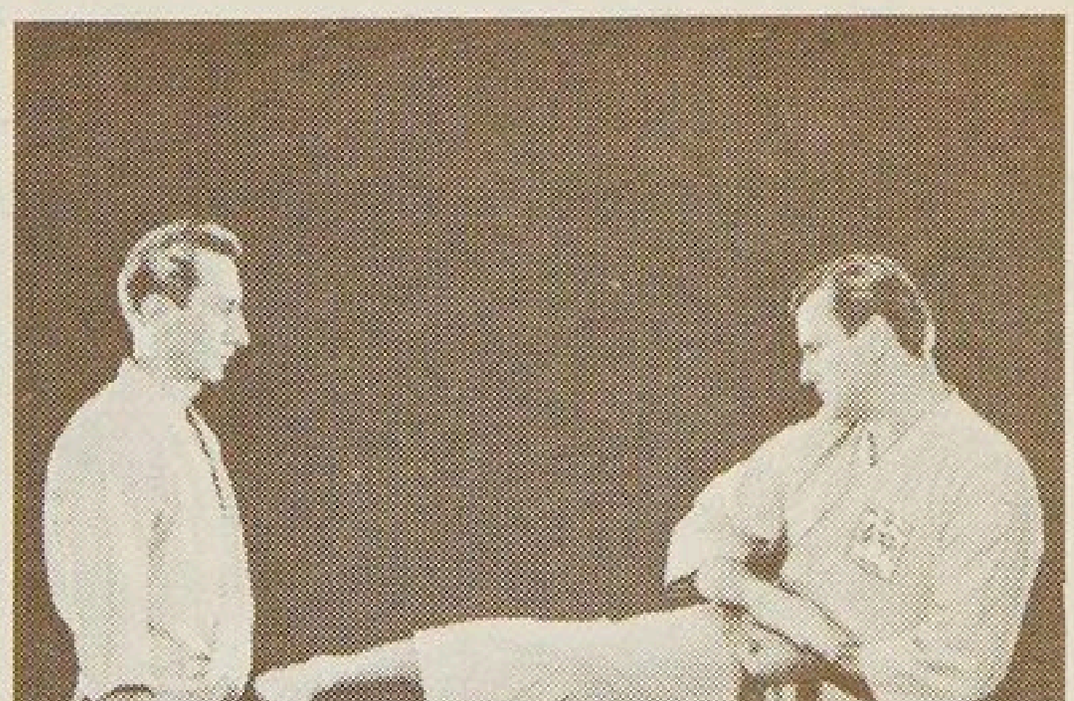
80



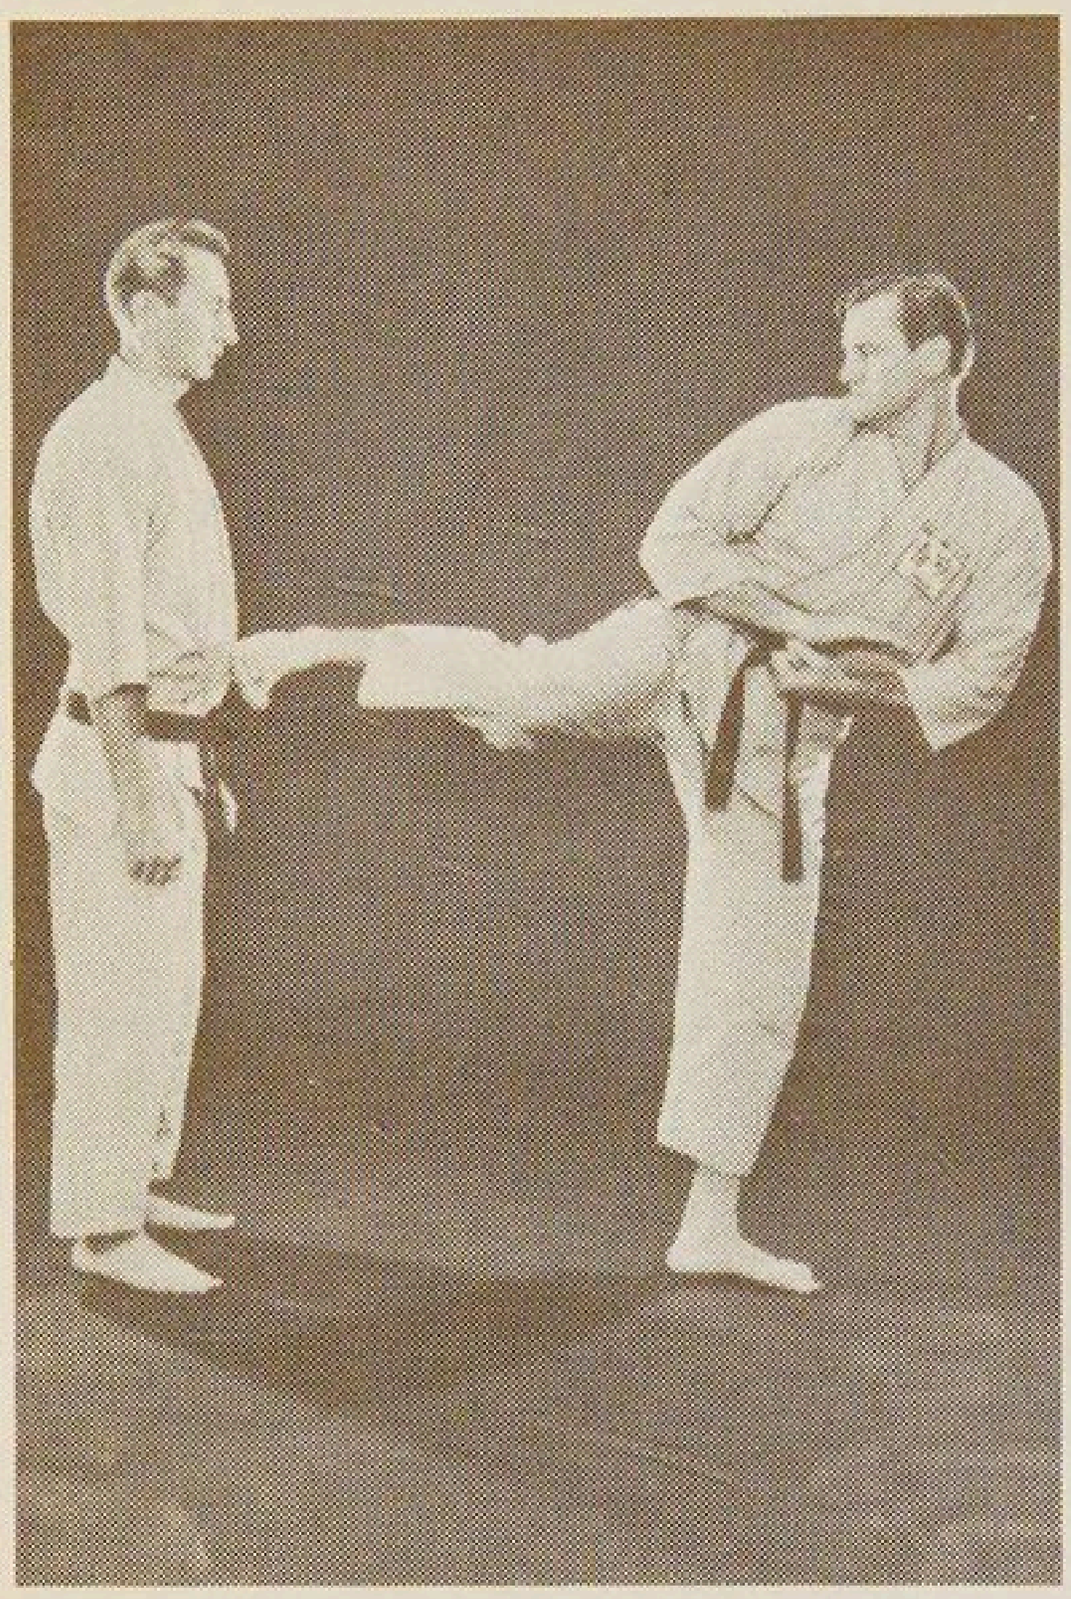
81



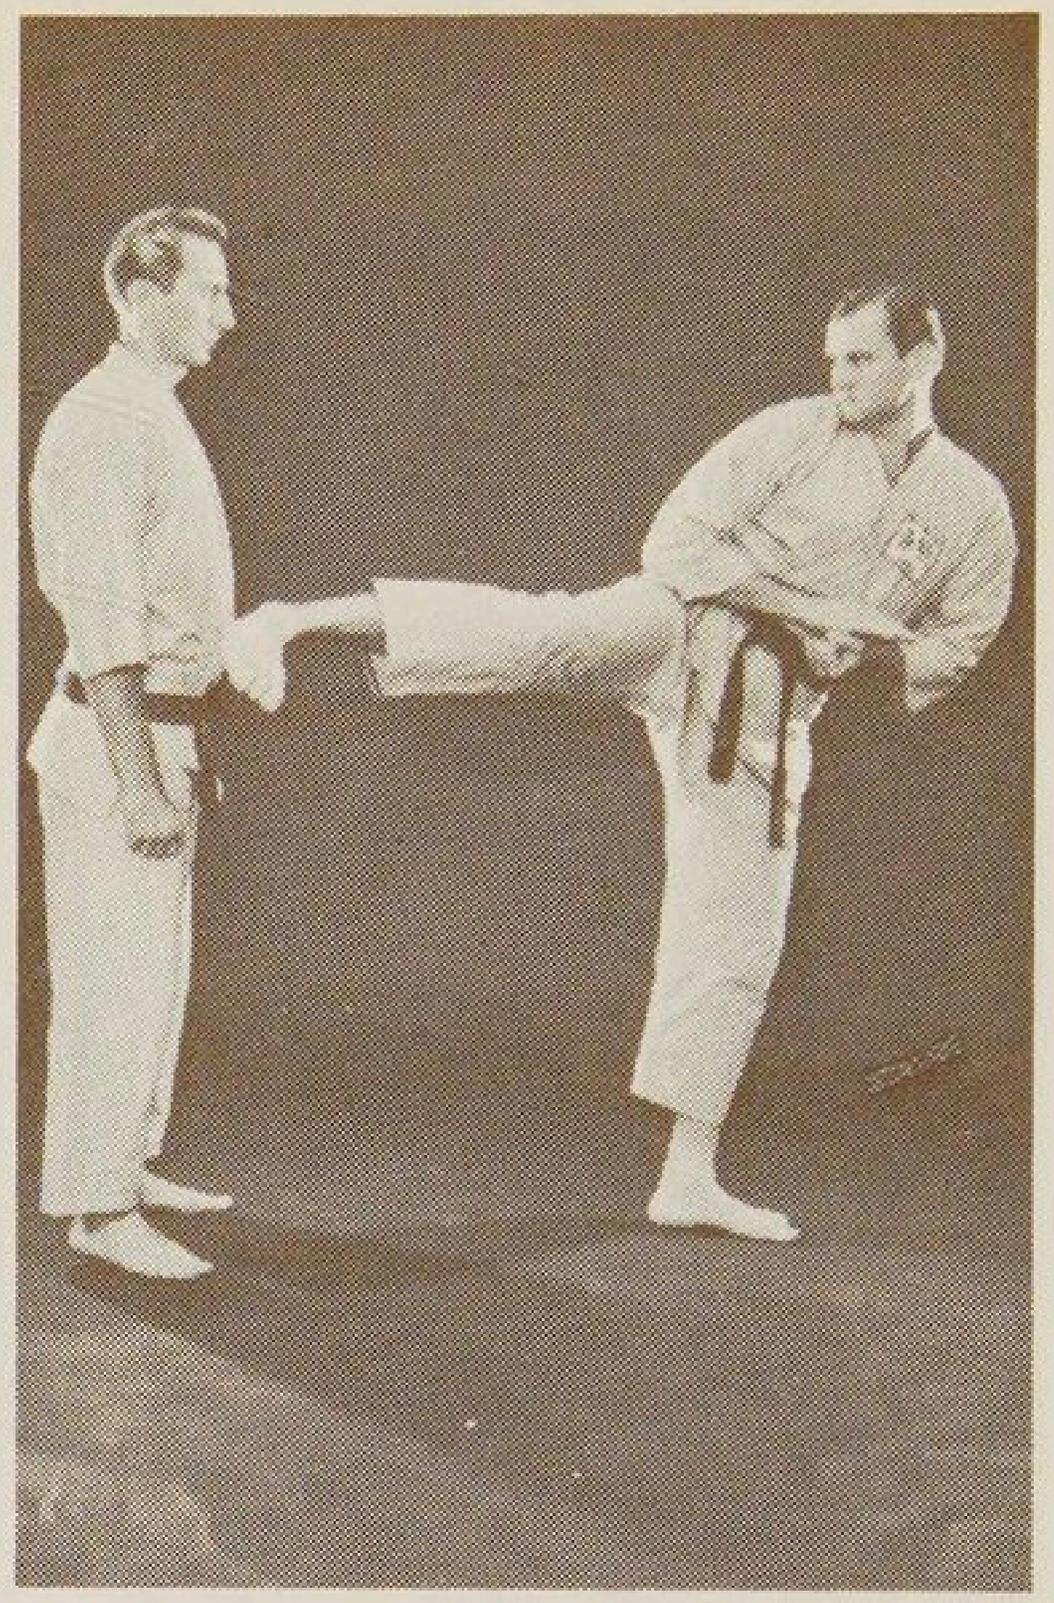
82



83



84



Bottom of Foot — Snap Kick Rear

83. Turn your upper body and look at your target, draw your leg up and deliver a bottom of the foot blow.

Edge of Foot — Snap Kick Rear

84. Turn your upper body, look at your target, deliver an edge of the foot blow.

Toe or Ball of Foot — Hook Kick Forward

85. Make a quarter turn on the non-kicking foot. Draw your leg up, with the foot as close to the buttocks as you can get it. In a circular motion, swing-snap your foot to the front.

Toe or Ball of Foot — Hook Kick Rear

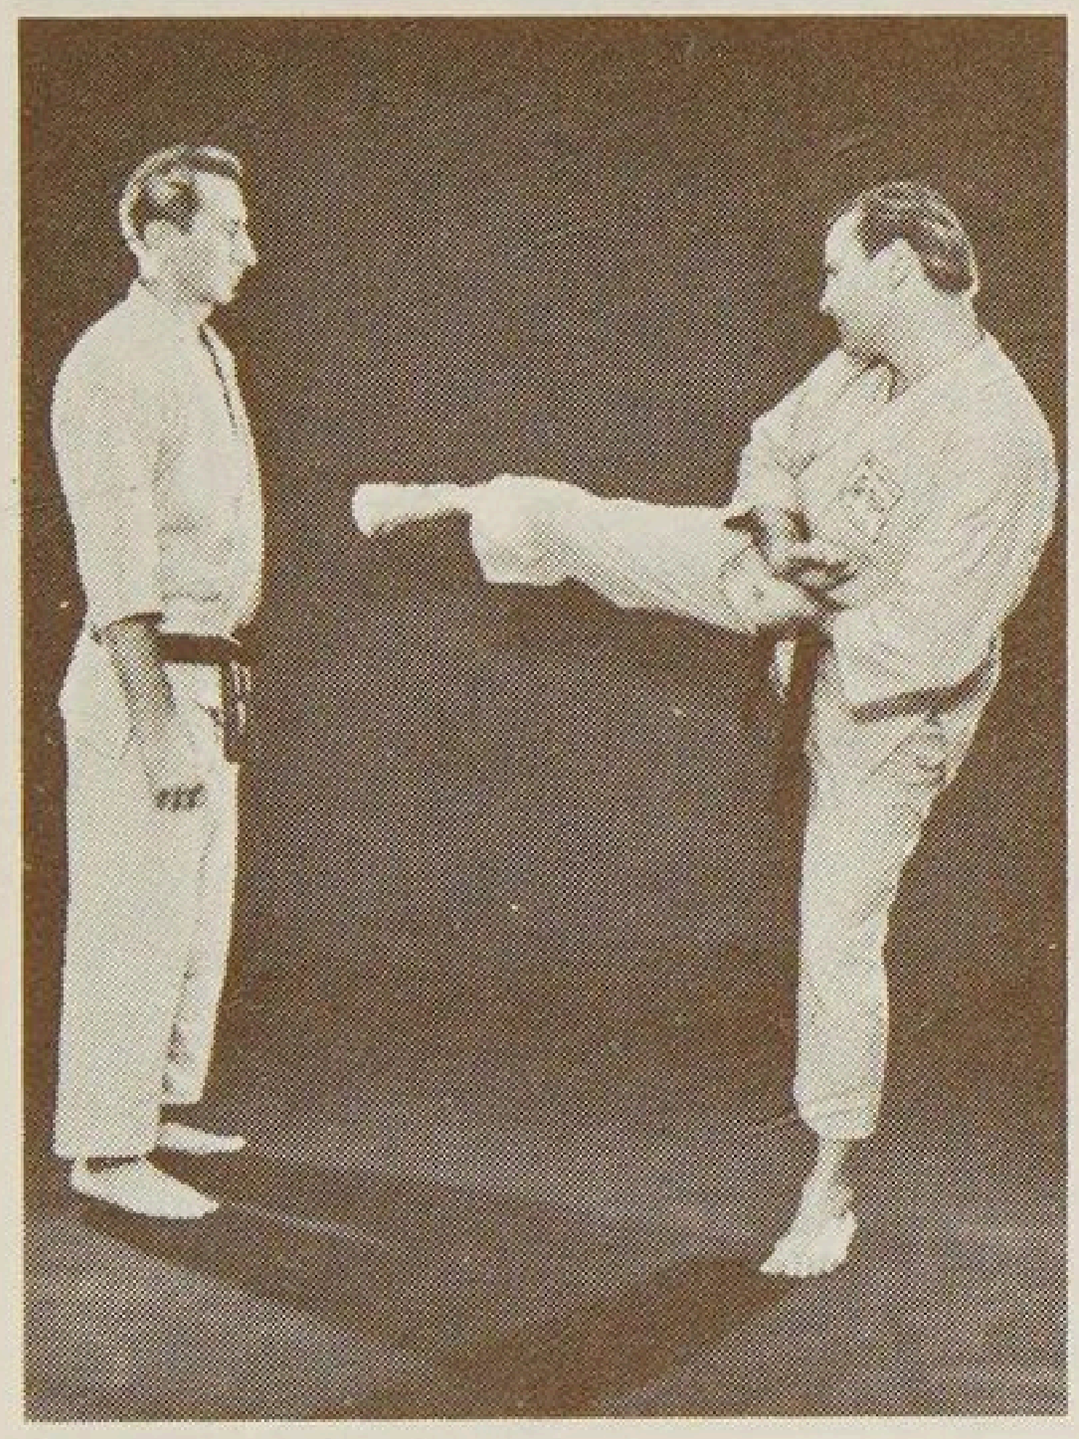
86. This is identical to the previous kick, but delivered to the rear.

Toe or Ball of Foot — Low, Forward

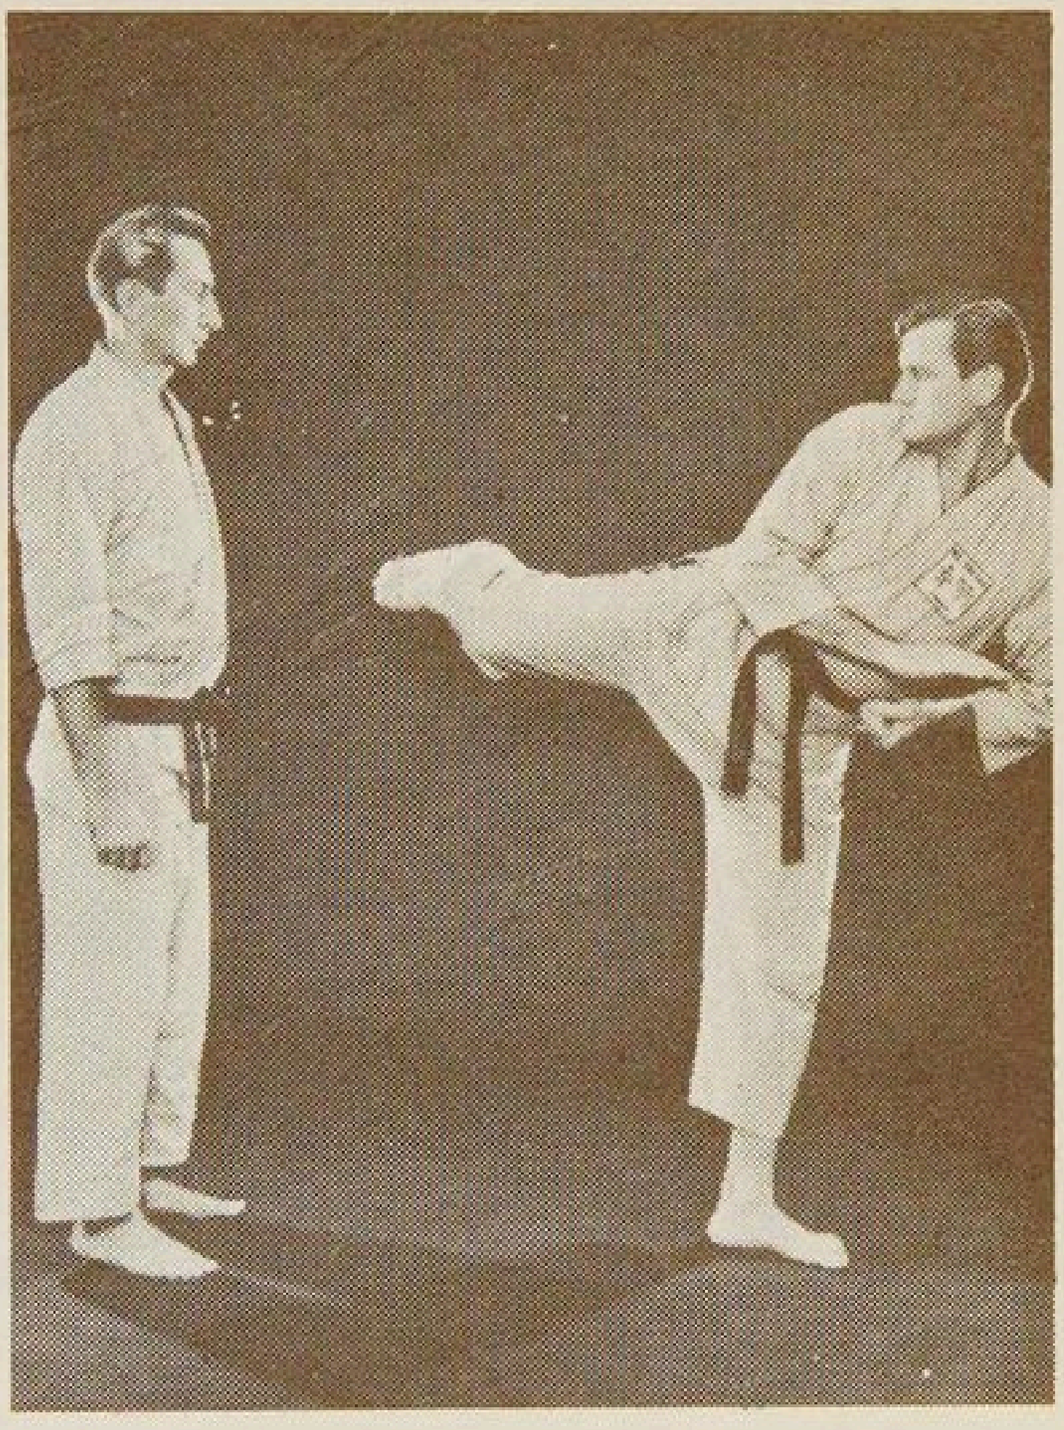
87. The major difference between this kick and the first kick in the series, is that this one is prepared for by raising the foot only slightly, to correspond with the target area. It does *not* start from the ground, it is not a stiff-legged kick. Raise your foot about six

inches, then snap forward vigorously. Barefoot, or with soft shoes on, use the ball of the foot; with hard shoes use the toe. Although this kick does require precision, when you acquire the precision to use it properly, the effect is terrific. The shin is a peculiarly sensitive area on most people and you can get great pain without inflicting serious or permanent damage.

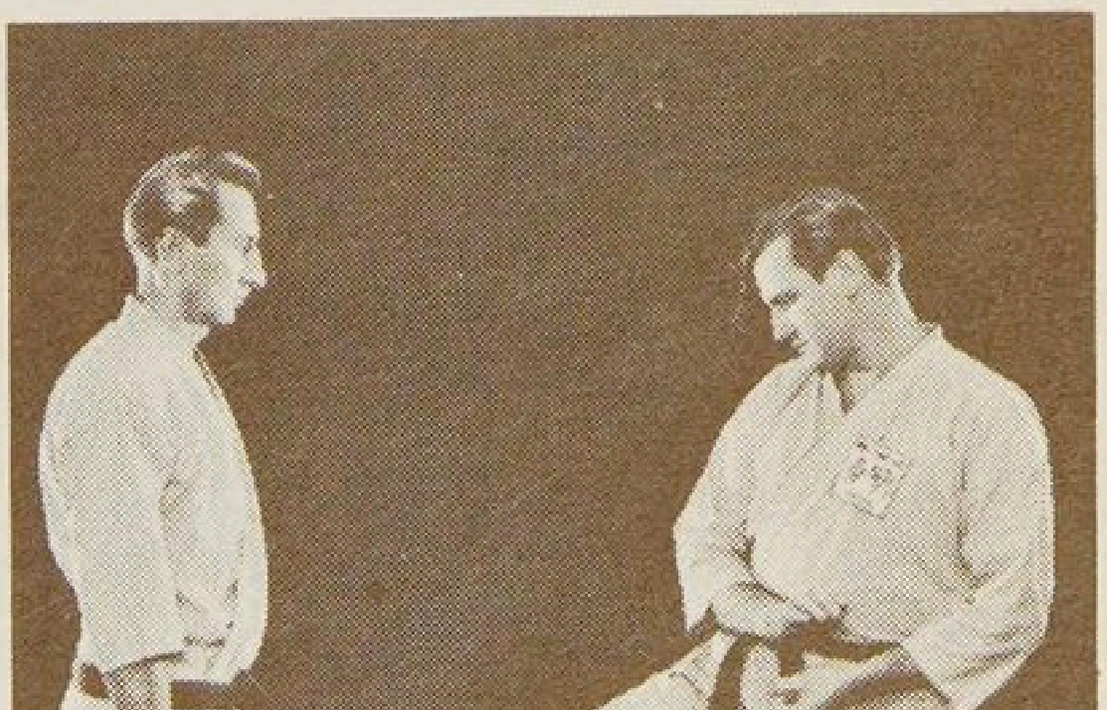
85



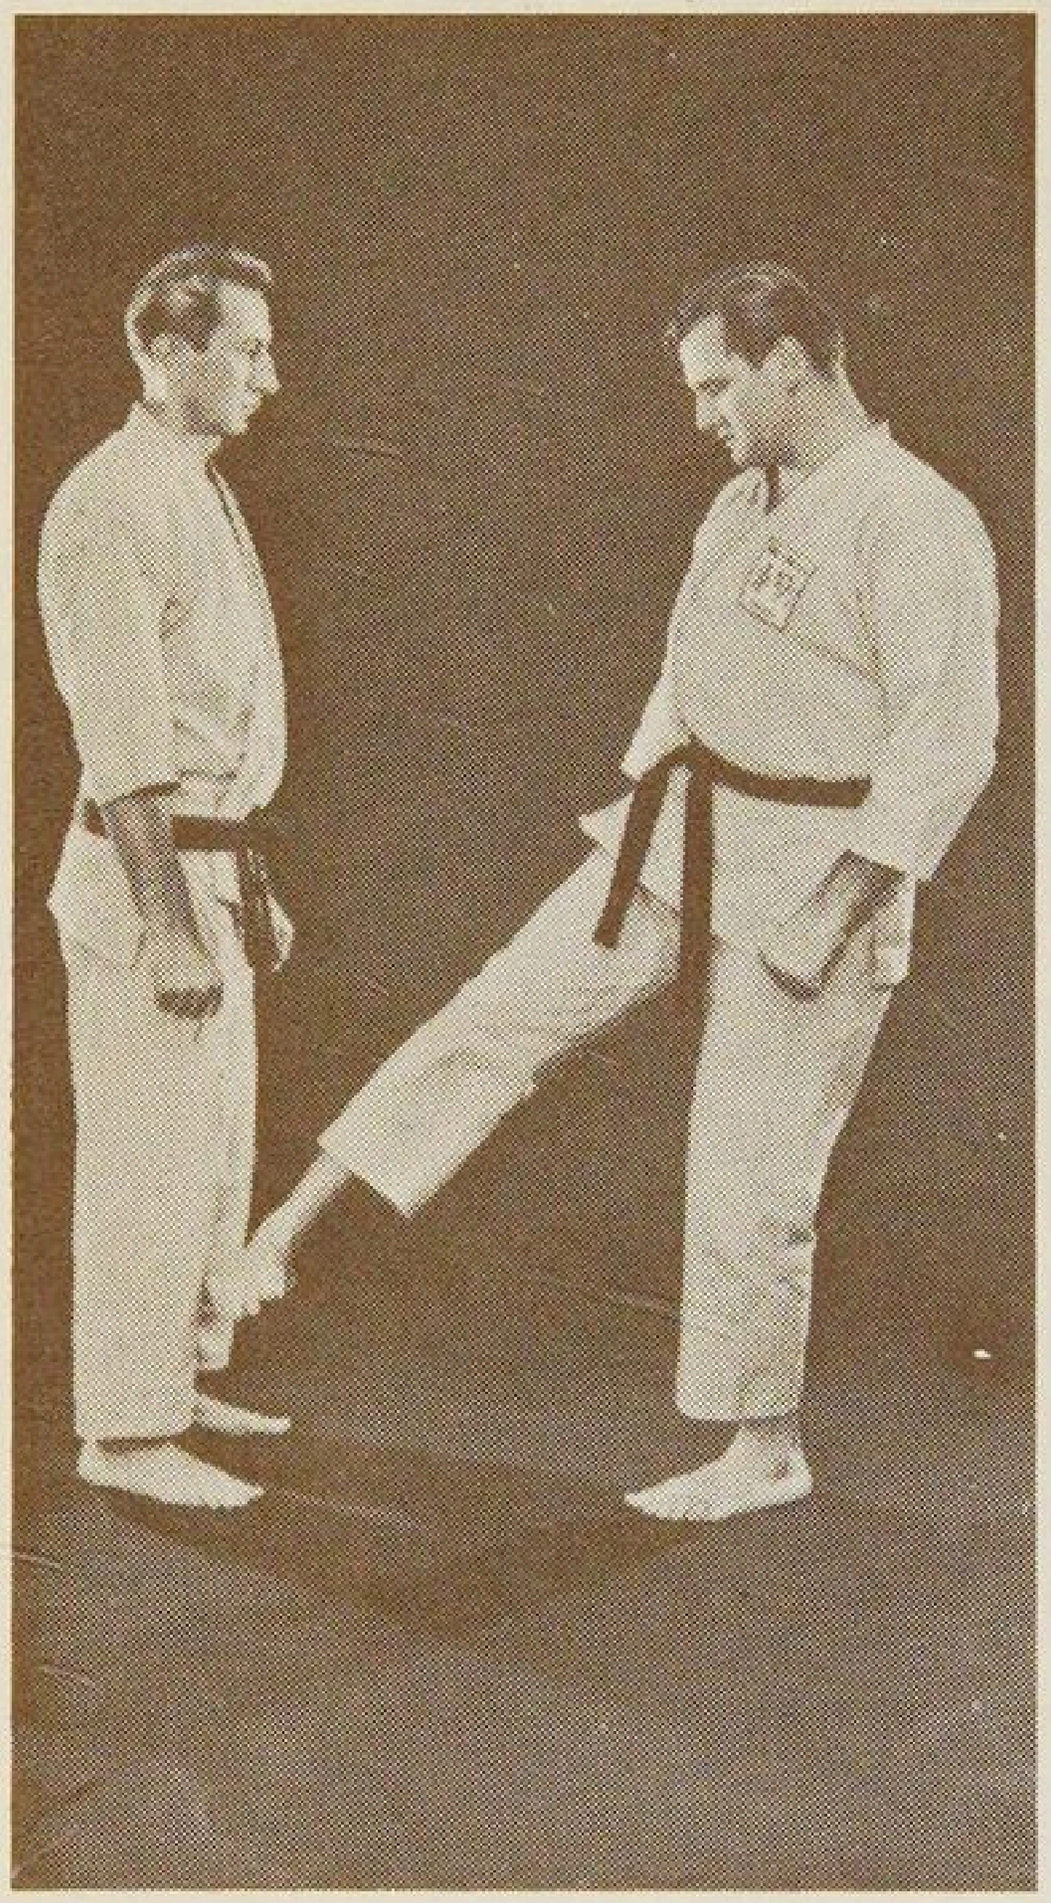
86



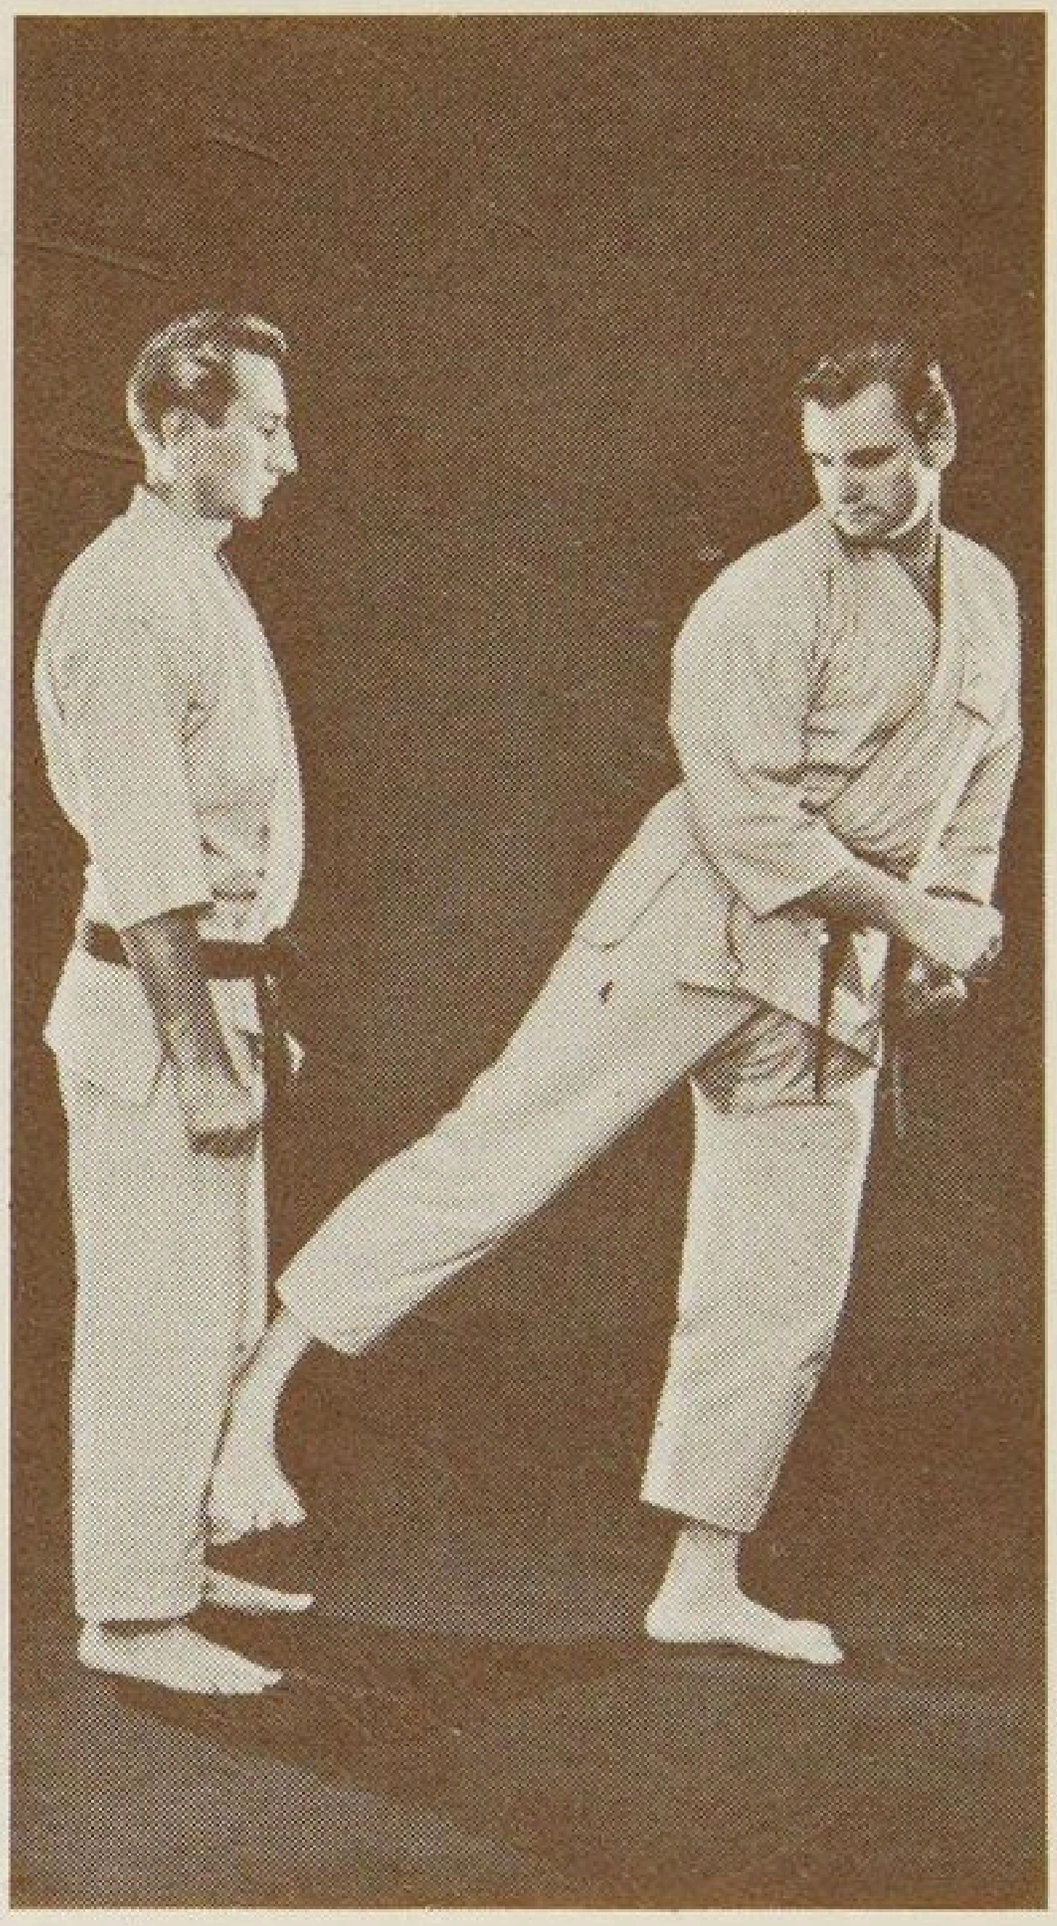
87



88



89



Edge of Foot — From Side to Side and Forward and Backward

88, 89. The action in the next three kicks is essentially the same, it is the direction of the target area which varies. First, with your adversary at one side of you, raise your foot slightly and snap out to the side with the edge of the foot (shoe), in a snappy, cutting action. With your adversary directly in front, snap straight out with the edge of the foot (shoe). With adversary to your rear, turn your head to see the target and deliver a snappy kick back. This is a very useful, versatile, easy kick, once you understand the essential action and have acquired even a moderate degree of ankle flexibility. Because the edge of the foot (shoe) gives a broad striking surface, your accuracy need not be exactly as precise as with the toe. Most effective use of this kick would be with the center of the edge of the foot (shoe) as the striking point, but you do not altogether lose the effect of the kick if you hit slightly too far forward or back, toward the heel.

NERVE CENTERS AND PRESSURE POINTS:
Vulnerable Areas of the Body

Nerve centers and pressure points are the target areas of the body into which hand and foot blows are aimed. The value of learning them is that a blow directed to a vulnerable part of the body is much more effective than a blow of the same force which is directed to a less vulnerable area. There are types of unarmed fighting which emphasize the development of power as their main objective; in these styles it is not necessary to know *where* to hit, as any blow which is landed with sufficient force will be effective. The fallacy of this method is that it will not work for small people. A 135-pound man would have great difficulty developing enough power to hit indiscriminately against a 210-pound adversary. The other argument against the "power" theory of unarmed fighting is that it assumes constant, continuing training, which is not a practical idea. Finally, women and children cannot hope to learn a form of self-defense which depends on power development. The alternative is to learn how to deliver effective blows to the most vulnerable areas of the body with only normal strength. Only 60 pounds of kicking force is needed to dislocate the knee of a strong man and render him incapable of fighting!

In order to pass the test for advancement to blue rank , the student must learn all the target areas which are taught in this section. These are selected as the first group to be learned because they are, in general, practical, available, vulnerable body areas for most people to use in most situations. However, since this course is meant to relate very closely to work which is useful for modern street defense, it should be pointed out that very small or weak people cannot use some of them with any hope of success and that such students must limit their self-defense application of the blows to a group of areas which will be noted at the end of this section.

TV, movies, and Oriental myth have popularized as "deadly" certain striking areas which are, in fact, not only useless and unavailable to most people, but silly in view of any elementary knowledge of human physiology. It is ridiculous to suggest that hitting under the nose drives the nose bone into the brain; it is bizarre to promote the idea that one can train to stab into the chest cavity and pull out an adversary's heart; and it is misleading to imply that a small person can apply a "chop" to the back of the neck of a big, strong man and lay him out.

FRONT BODY AREAS

Temple

a. The small, depressed area which is ordinarily exposed and available. It is back about ½" from the ridge of bone which surrounds the eye. A moderate blow will cause pain as there is a concentration of nerves at this point. A heavy blow will stun or cause unconsciousness and a full-power blow by a strong person could be fatal. It is the referral shock into the brain which is dangerous, and a heavy blow should be considered as appropriate only against vicious attacks.

Under the Ear Lobe

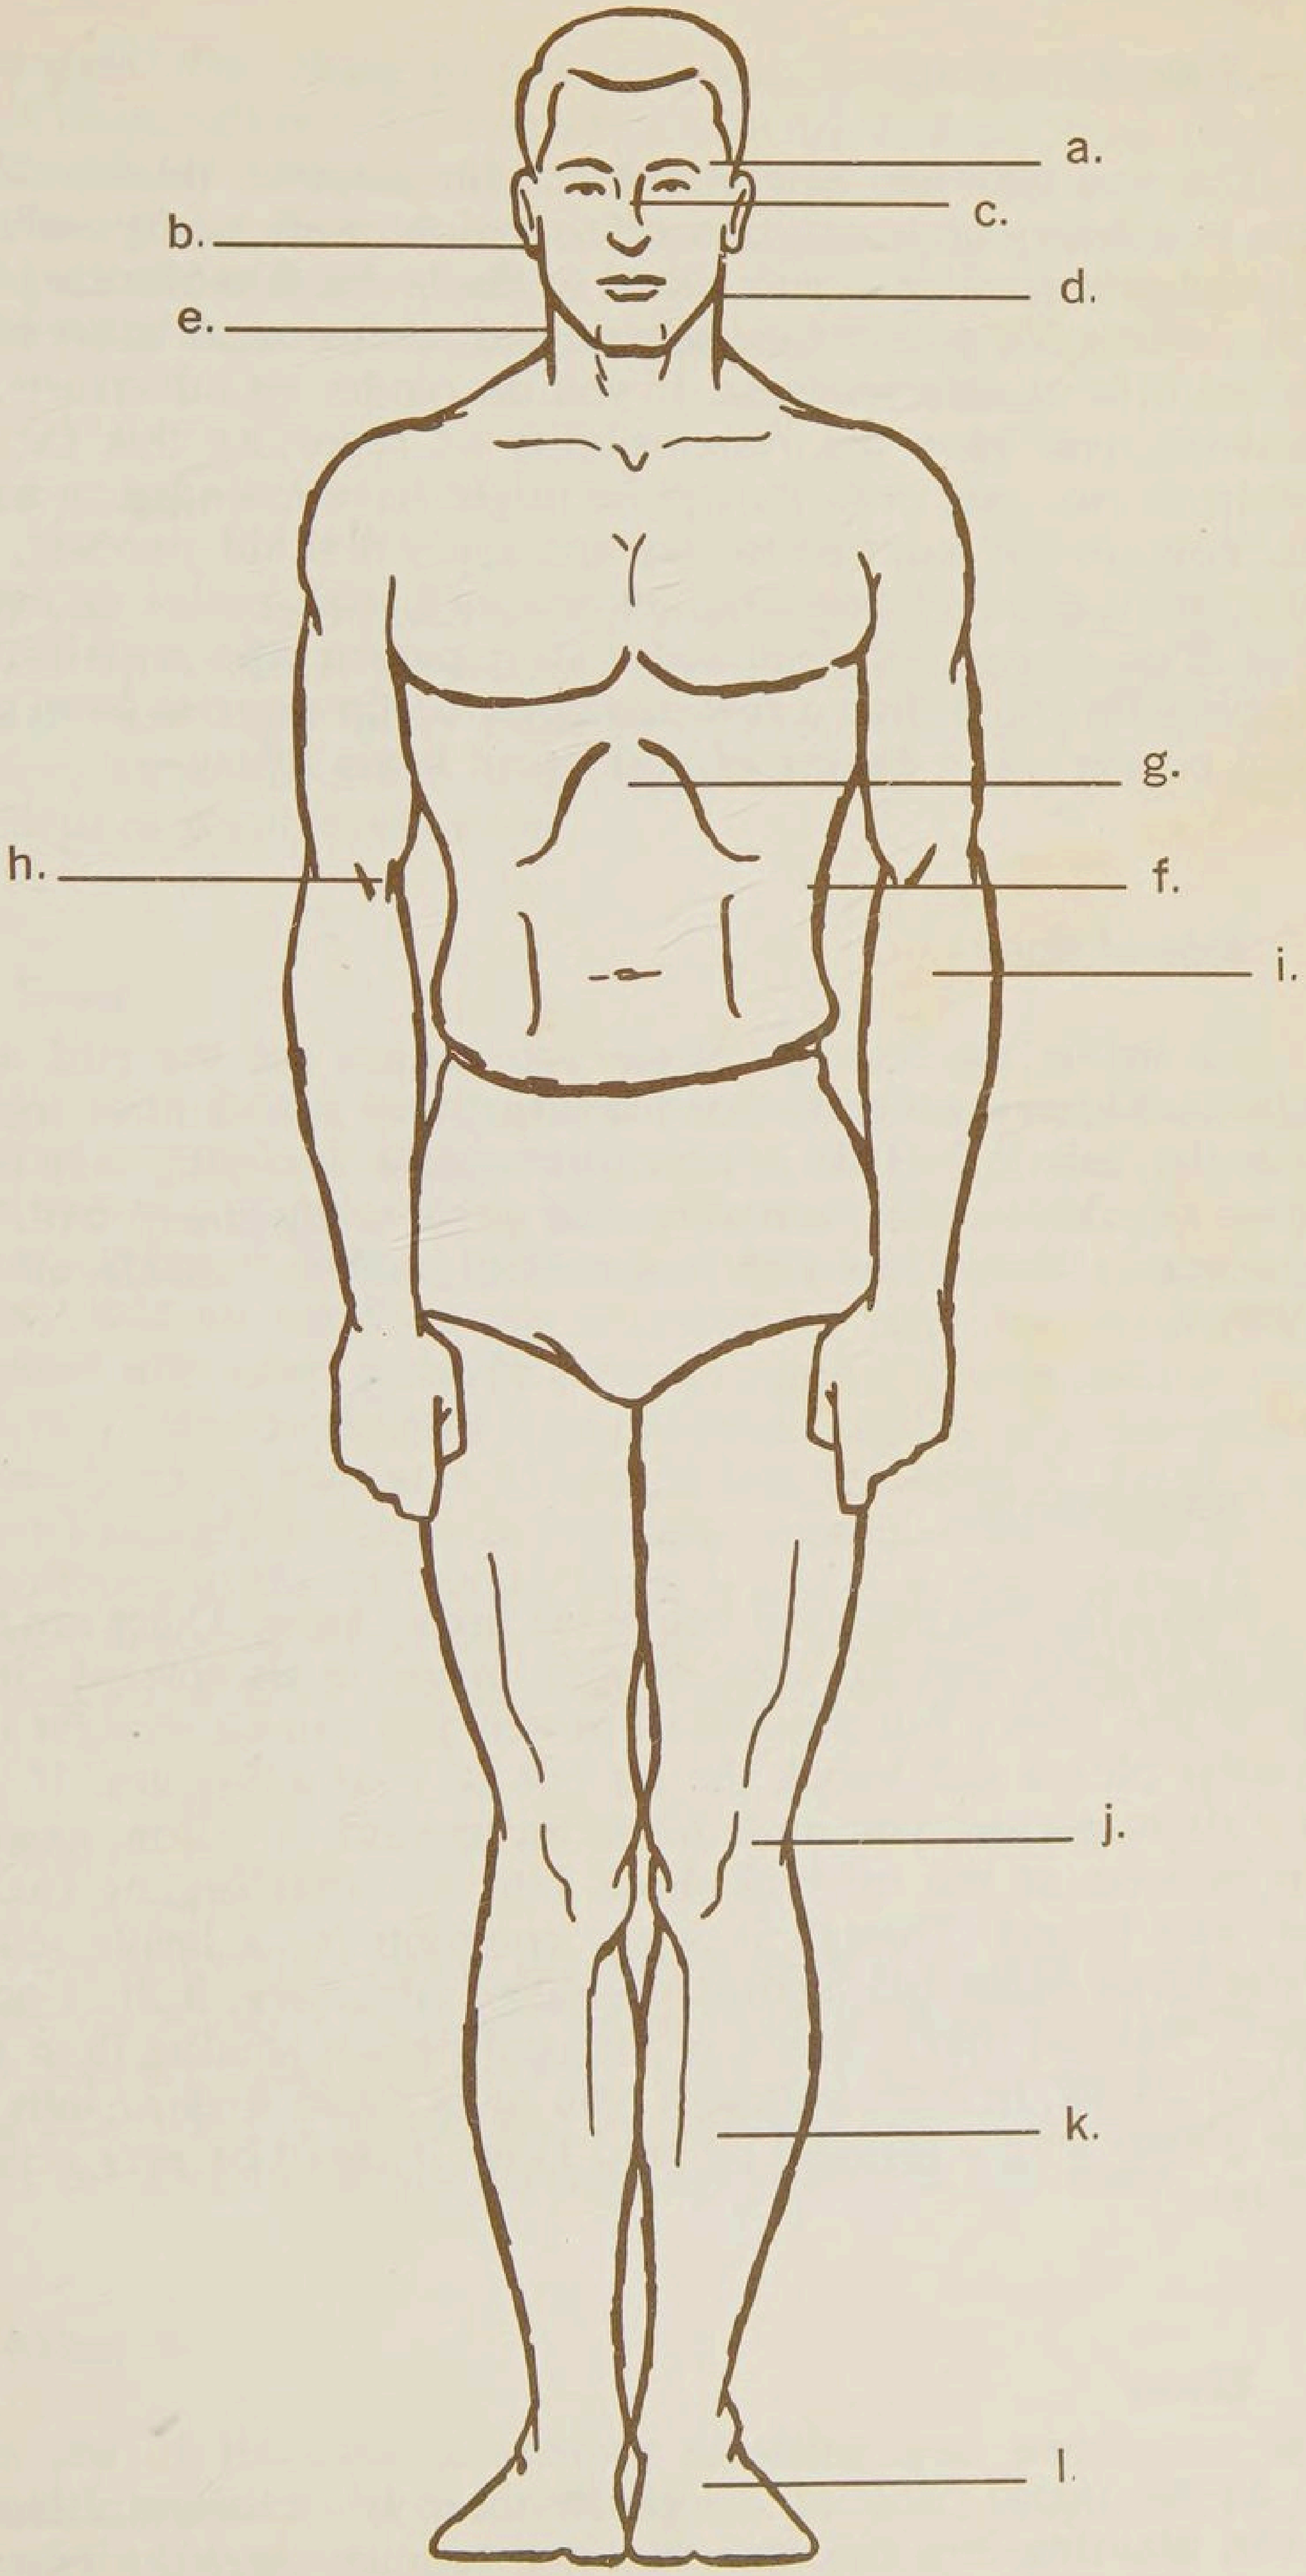
b. There is a sensitive area which is immediately behind the ear lobe. A digging action into this spot causes pain. This is not recommended against violent attacks, but can be extremely effective against a grabbing or other annoying type of situation.

The Nose

c. Striking down onto the bridge, or striking upward under the nose. Striking the nose is very useful because with only a moderate blow great pain results. This is not a killing blow, contrary to popular superstition. As the nose is mainly cartilage and flesh, there is no way of "driving a nose bone up into the brain." Boxers frequently get their noses broken in the course of a match and are not even aware of it until the fight is over. It is, of course, possible that an extremely strong and powerful person could deliver a blow to the nose which might be fatal, not because it hit the nose, but rather, because the referral shock to the brain from *any* blow to the head is dangerous when delivered with great power. Commonly, it is disconcerting and distracting to sustain a blow to the nose and frequently there will be bleeding as well as pain. Striking onto the bridge of the nose cannot be done naturally by a very small person against a large adversary, but striking up under the nose, as with a heel-of-the-palm blow or slash is possible for almost anyone.

Up Under the Jaw

d. In the fleshy area of the neck, on each side of the windpipe, behind the jaw bone, there is a sensitive area which can be hurt easily. A digging action with the thumb can repel an annoying attack; a knuckle, or finger stab with vigor causes great pain.



a.
b.
c.
d.
e.
g.
h.
f.
i.
j.
k.
l.

Side of the Neck

e. The area between the ear lobe and the shoulder muscle. Here there is a heavy concentration of nerves, as well as exposure of vein and artery which supply blood to the brain. A moderate blow to this vulnerable area can cause pain and confusion. A heavy blow can result in unconsciousness. If you do render an adversary unconscious, you have the responsibility of reporting this fact as quickly as you can, even though he might have intended to harm you. You are not required to stay and apply first aid yourself, but you should, if at all possible, get in touch with police or emergency first aid and tell them about it. A person who remains unconscious for more than a few minutes (the time varies from person to person) is in danger of permanent brain injury.

Side of Body

f. Just below the last rib. Since you cannot see the ribs of a clothed adversary, estimate that the target area is about two inches above the belt line. This is practical against annoying and non-vicious attacks, and the action can be either a digging-in with the knuckle, or a sharp blow with penetration (such as knuckle, elbow, or toe).

Solar Plexus

g. Where the ribs part, just below the breast bone. There are two ways of striking into this area; straight in and in an upward direction. If you have a fair amount of power, you can hit straight into the solar plexus and knock the air out of your adversary. If you are a slight person, you must hit in an upward direction, causing pain because of the referral shock into the vital organs (heart, liver, and lungs). Though it is not common for a heavy strong person to be defending against a smaller adversary, it does occasionally happen that a drunk or enraged person smaller than you are will attack. In such instances, you must avoid striking into the solar plexus with a forceful upward blow; it could be very serious or fatal.

Elbow

h. In the inside bend of the elbow there is a concentration of nerves. Slashing into the area does not require great precision to

effect pain. The virtue of this technique is that you can actually numb or paralyze the adversary's arm by striking here, limiting or completely stopping his ability to use the arm, but minutes later he will regain its full use. You can, therefore, effectively defend yourself without needless violence. The process is quite similar to what happens when you strike your "crazy bone."

Forearm

i. If you make a fist and extend your arm (palm down) you can find the nerve center by pressing into the high point of the muscle mound. Very slight finger pressure will result in pain; a moderate or heavy blow will numb or paralyze the arm. There is no danger of serious or permanent injury.

Knee

j. This is a prime target. Even a small woman can kick with sufficient power to dislocate or break the knee of a much heavier, larger person. It is possible to kick without coming within fist range of your adversary. With a broken or dislocated knee, it is extremely unlikely that an assailant can continue his intended attack. Yet, compared with other possible defenses against vicious attacks, this one is very humane as there is no danger of fatality. For best effect, it is necessary to kick at a 45° angle into the knee. If the kick is delivered straight in, there is a certain amount of flexibility to resist the blow; at the 45° angle, there is less give. Even if the blow does not dislocate or break, a vigorous kick into the knee will easily put an adversary off balance or could put him on the ground.

Shin

k. From below the knee to the instep, there is an area of exposed bone nerves which is extremely sensitive on most people. It is quite rare to find a person who does not respond to even slight pressure on the shin bone. You can test on yourself how effective it is to hit here by applying finger pressure on your own shin bone.

Instep

l. On top of the foot is another sensitive area which can be struck with moderate force to effect great pain. A heavy, smashing kick onto the instep can result in broken bones.

REAR BODY AREAS

Side of the Neck

a. This is exactly the same target areas as is available from the front, which is an additional reason for its practicality. The famous "chop" to the back of the neck which is a favorite movie technique has nothing to recommend it; a small slight person cannot hit a heavier person with enough force to be effective; on the other hand, a powerful blow by a strong person against someone weak could cause permanent paralysis. This area is better.

Kidney Area

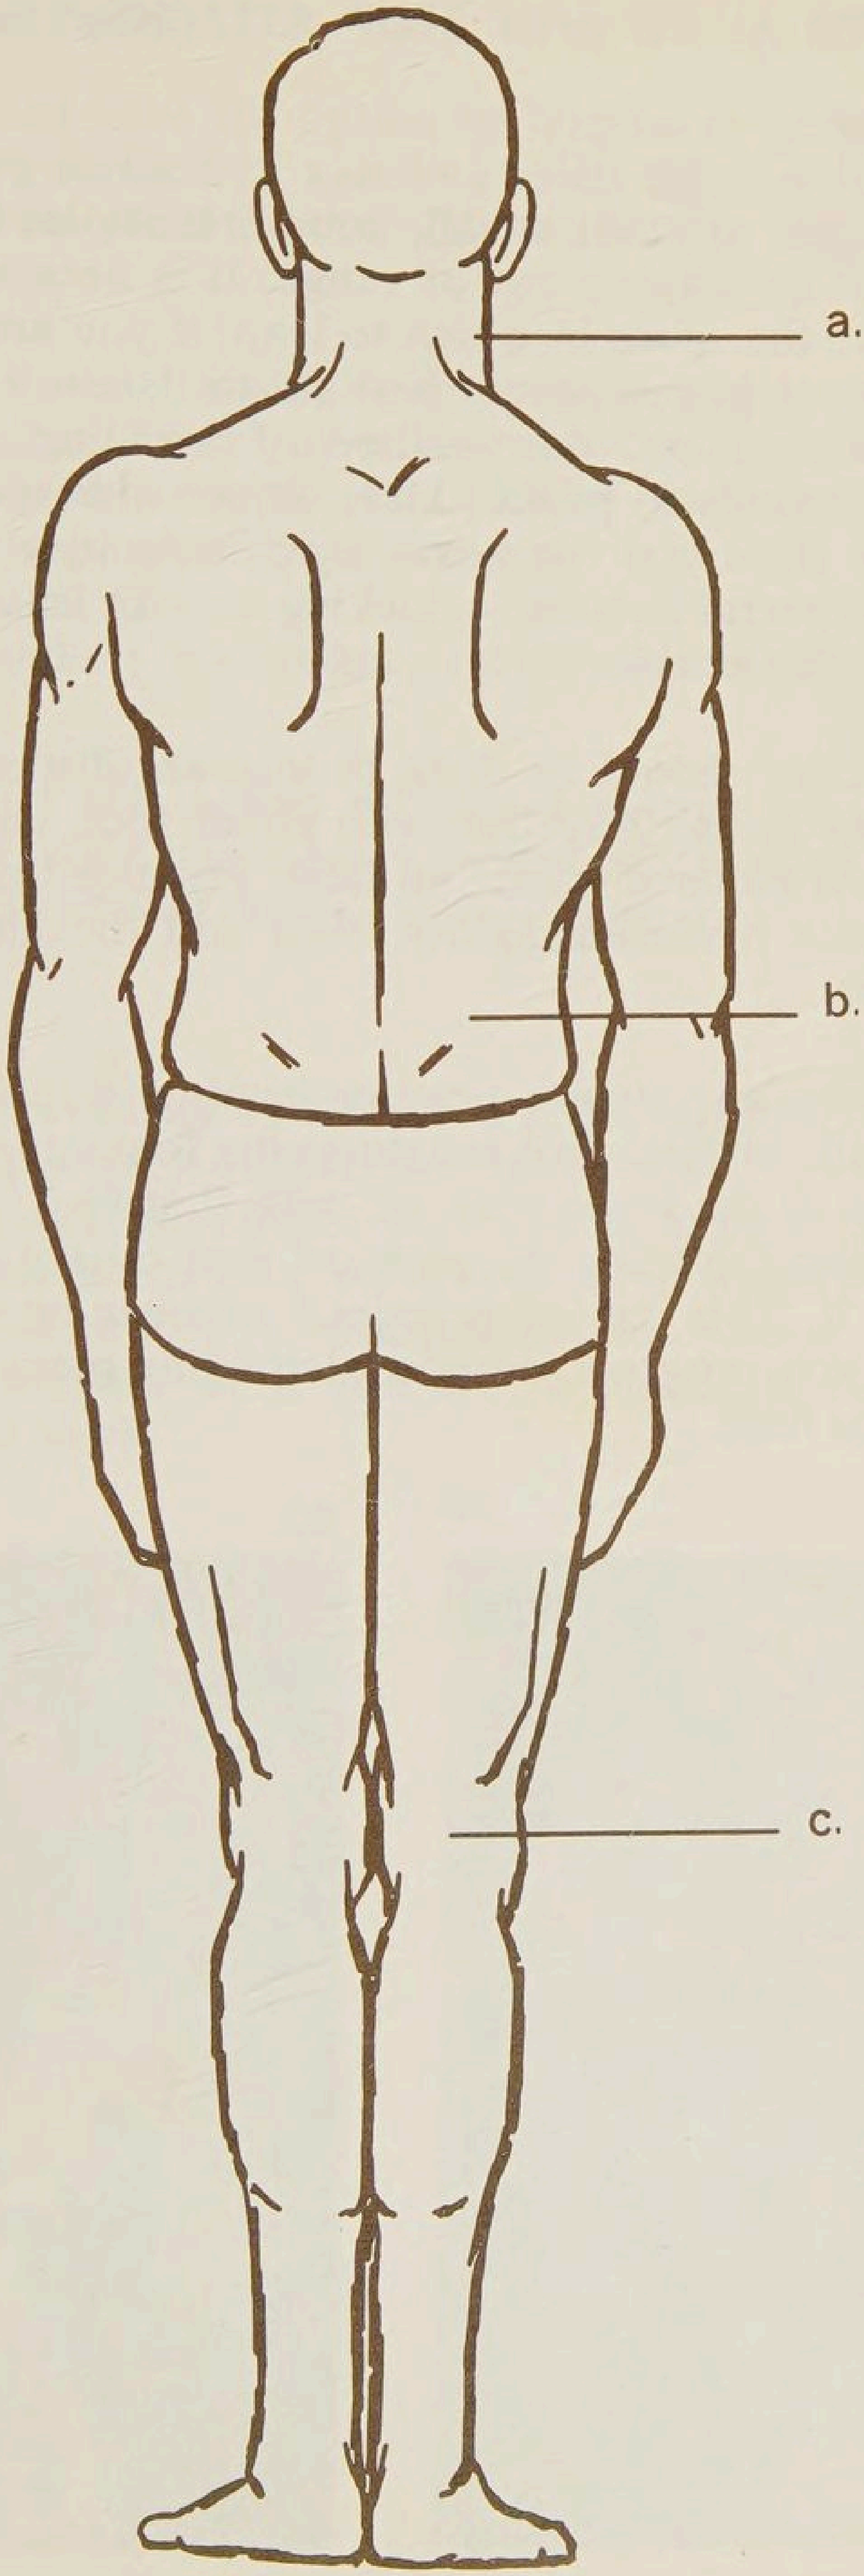
b. About two inches up from the belt line and about two inches on either side of the spine, are the kidneys, which are extremely sensitive organs. A heavy, powerful blow delivered by a strong person against a weaker person can be fatal. However, a weaker person defending against a large assailant can strike with force into the kidney, in an upward direction, and the result will be great pain and weakness. A blow delivered straight into the kidney area is not so effective.

Behind the Knee

c. The results of a kick into the back of the knee are: pain, loss of balance, and impairment of the use of his leg. With a vigorous kick into the back of the knee, you can even put him on the ground.

As noted at the beginning of this section, the student who wishes to pass the test for blue rank , must know all the target areas shown in this section. For practical self-defense for small people, not all of these areas are useful; a small person will find it very difficult and awkward (therefore, ineffective) to strike in a downward direction at the upper body targets on a larger assailant. The good, available, effective target areas for a small person against a large adversary are in the lower body: best are knee, shin, and instep. When close in to an adversary, a small person can effectively use the heel-of-the-palm blow up under the chin. Striking into the eyes or windpipe is reserved for vicious, close-in attack and is effective even when used by a small person against a much larger opponent.

The general rule for determining which are the useful practical striking targets is this: Can you easily deliver a blow to the target without loss of balance, without coming unnecessarily close to your adversary, and does it permit the full use of your strength?



a.
b.
c.

HOW TO AVOID AND STOP ATTACKS

Leaping

If you have any warning at all, your first choice of avoiding an attack should be leaping out of range. It is necessary, of course, that you have the space in which to leap; if you are cornered, you cannot. Because you need not hesitate to determine *exactly* what the assailant is doing, this method of avoiding attack is ideal. Whether he intends to punch, kick, or use a weapon, leaping out of his range gives you the advantage, being in a position to use your most powerful defense — kicking — with least danger to you of his continuing attack.

Leaping practice should be done to increase distance of the leap, ability to leap to any direction with either foot, and the ability to maintain good balance when you land. Practice the leap until you can move with moderate agility, then add the kicking action to your practice.

92, 93. From any stance, practice leaping in this fashion: place weight on balls of feet, shift weight to the foot which is away from the direction of the leap; push off with that foot, land with good balance. Without placing the push-off foot on the ground, deliver a kick with it. This can be practiced whether or not you have a partner. As you progress, practice delivering more than one blow with the same foot.

92

93

Dodge and Parry

When you do not have the option of leaping to avoid attack, the dodge and parry method of avoiding many types of hand blows is satisfactory. It is ideal for straight-in blows, which are most common.

94. As the attack is made, dodge your upper body out of his range and simultaneously parry his arm with one or both hands slashing. This is done with and without foot movement. You should learn to respond to the situation.

95. After avoiding his attack, retaliate with hand and foot blows.

You can practice this action without a partner by looking in a mirror to check your upper body movement, making certain that you have actually moved out of theoretical range.

Blocking

This method of avoiding an attack is least versatile of the "stopping" actions. It is very difficult for an extremely small person to block effectively against a much heavier and larger assailant. However, it should be learned for the situations in which it is the only possible course of action. A wide hooking blow must be defended against in this manner, or if you are so pinned in that no other technique would work.

94

95

This is practice which should, of course, be done with a partner. Practice alone is moderately useful to develop speed and snap, but the essential thing is to develop quick reaction to a gesture which simulates a threatened punch, and this is quite difficult without a partner to work with. As you practice, you should begin by making slow and obvious movements so that your partner can first learn the proper technique of blocking. As you progress, you make your simulated punches faster and faster to develop the speed and reaction time which is necessary. Token blocking is sufficient for beginning practice; as you develop proficiency, you can actually block by making contact. You will find that your arms will get sore if you practice contact blocking, but there is no danger of injury involved and the practice is very useful. You can use slashing hand blows for blocking (which require greater accuracy) or you can make forearm blocking blows. Practice both.

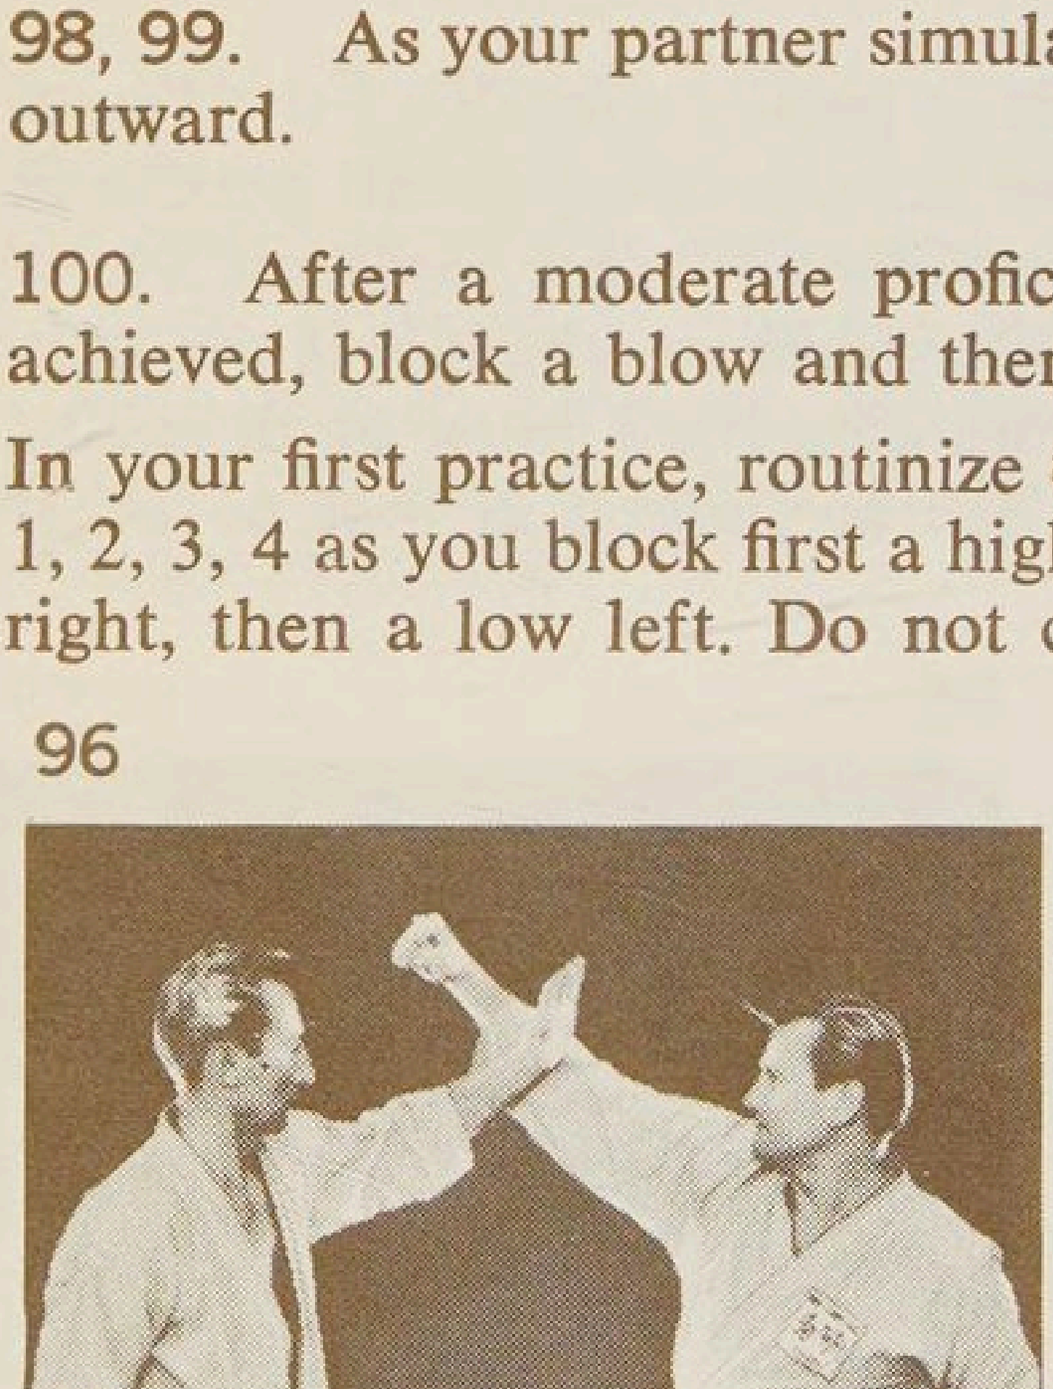
96, 97. As your partner simulates a high blow, block vigorously up and outward.

98, 99. As your partner simulates punching low, block down and outward.

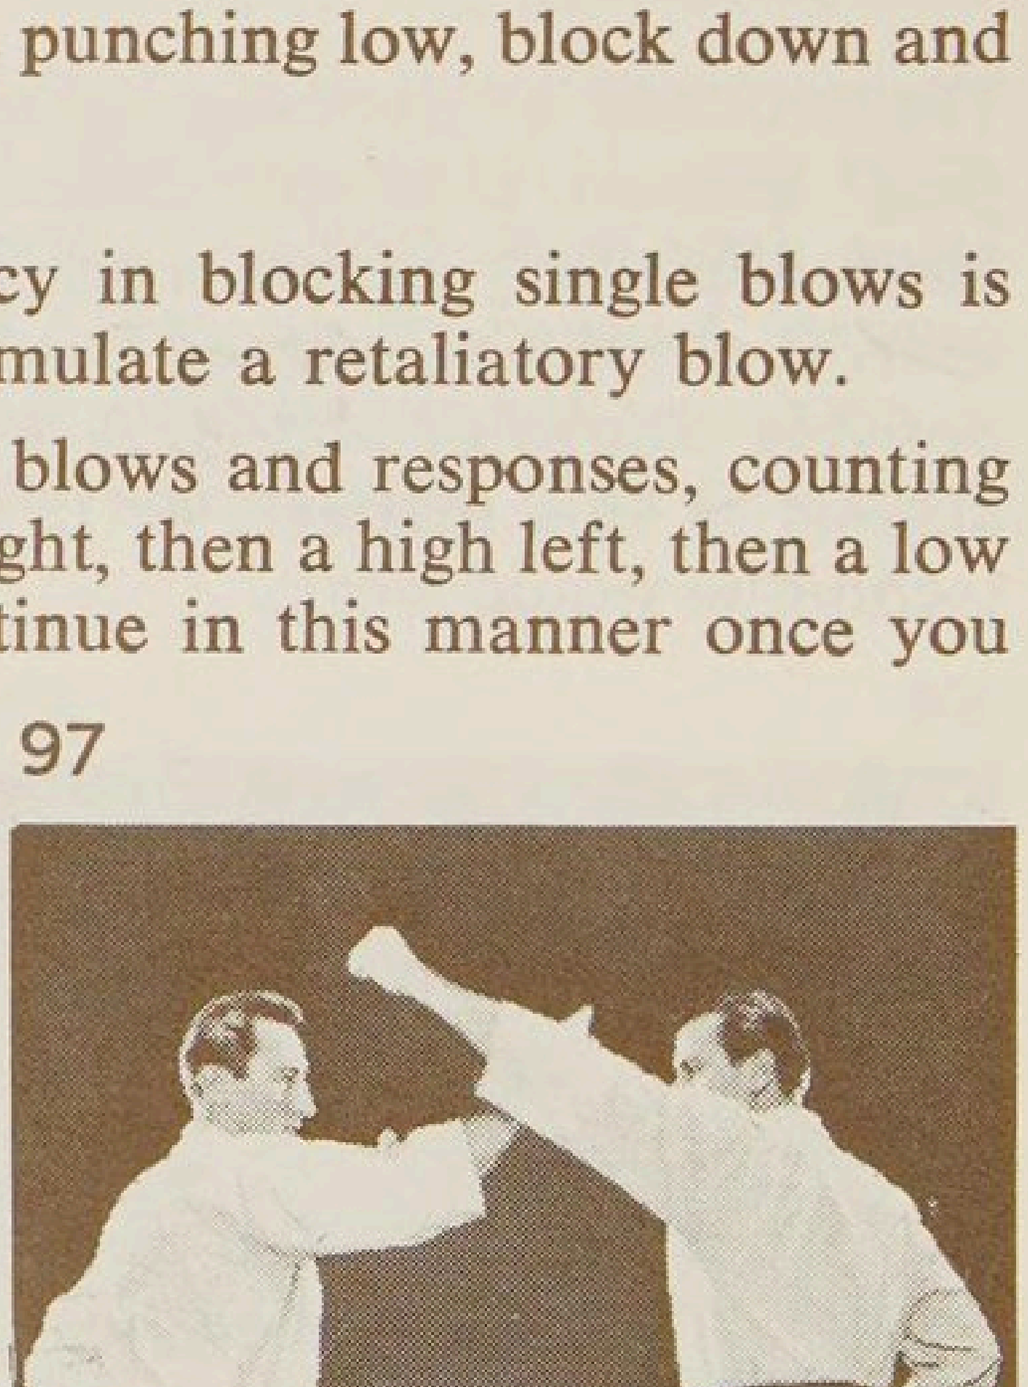
100. After a moderate proficiency in blocking single blows is achieved, block a blow and then simulate a retaliatory blow.

In your first practice, routinize the blows and responses, counting 1, 2, 3, 4 as you block first a high right, then a high left, then a low right, then a low left. Do not continue in this manner once you

96



97



98

99

100

have learned the proper technique of the blocking action; proceed immediately to a more flexible style of practice, allowing your partner to mix the high and low blows. Later in your practice, other elements of variety, such as feinting, several blows with the same hand, etc., may be added, so that it corresponds with street-fighting tactics and allows you to increase your quickness and appropriateness of response.

HOLDS AND LOCKS: Basic Techniques

Holds and locks are a necessary group of techniques to learn for use in particular situations. They are needed for control and restraint; they may, in some limited instances, be used as an ending technique after first having stopped a serious attack with kicks and blocks. Holds and locks alone are not practical for stopping a violent attack; to attempt to hold or grapple with an assailant who is trying to knife you, or to try to catch or grip the moving fist of an efficient street fighter is simply not possible unless you have had many years of training and practice. The old style of teaching holds and locks (aikido) makes exactly that assumption, that you must spend many years in training.

Whenever you need to defend yourself, your judgment must be used to determine not only what is effective and adequate, but what is appropriate. Techniques which you would be justified in using against a violent or vicious attack would be quite unjustified when used against an annoying person who does not intend to harm or hurt you. Your sense of decency tells you that a person who is merely a nuisance is not treated in the same manner as someone brutal.

Against an annoying person, the holds and locks, properly applied, can be very effective. There is another type of situation in which you might use the holds and locks and it is not uncommon: if, at a party, an otherwise friendly person becomes unruly, you might have to prevent him from hurting anyone, but you would not want to hurt him. In such a case, you might use a minimum of the stronger techniques and then apply a hold or lock for restraint.

Do not make the mistake, however, of assuming that you need not be careful in practice of holds and locks. When applied with vigor, or with jerky, rough action, they can cause extreme pain to your partner. Holds and locks cannot effectively be learned without a

partner and you must therefore exercise great care, especially when you are a beginner. Do not smash down, snap, bounce, or jerk into the holds. Release *immediately* upon tapping signal. Even when you gain considerable proficiency and can do the work quickly, avoid rough, jerky, or snapping actions for safe practice.

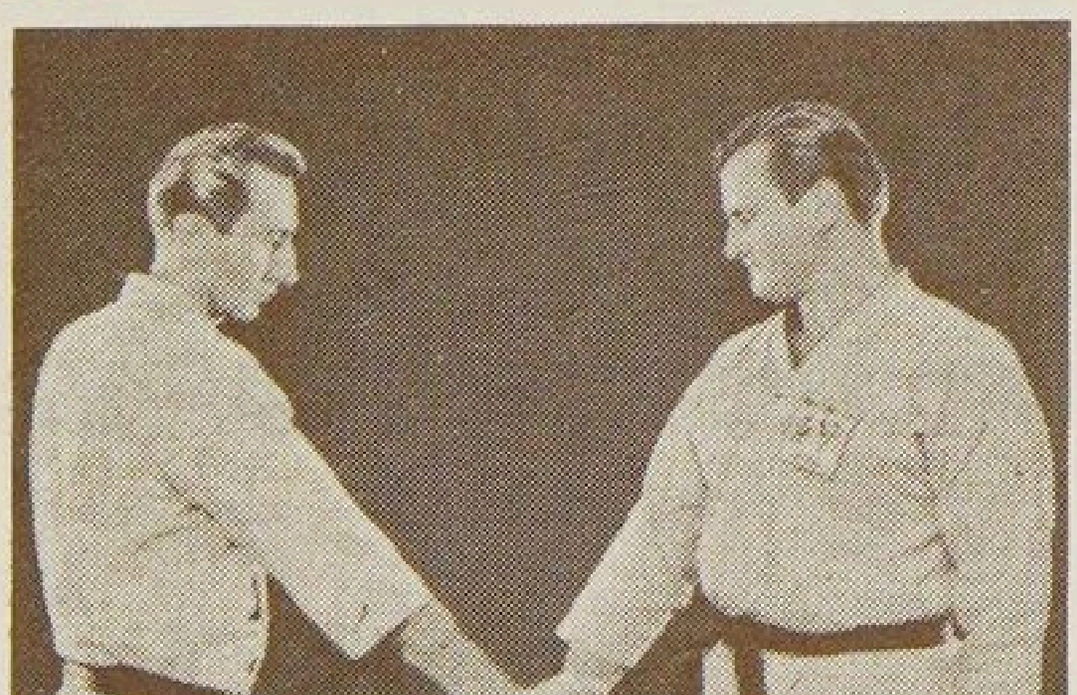
HOLDS AND LOCKS: (For Formal Demonstration)

Basic Arm Bar

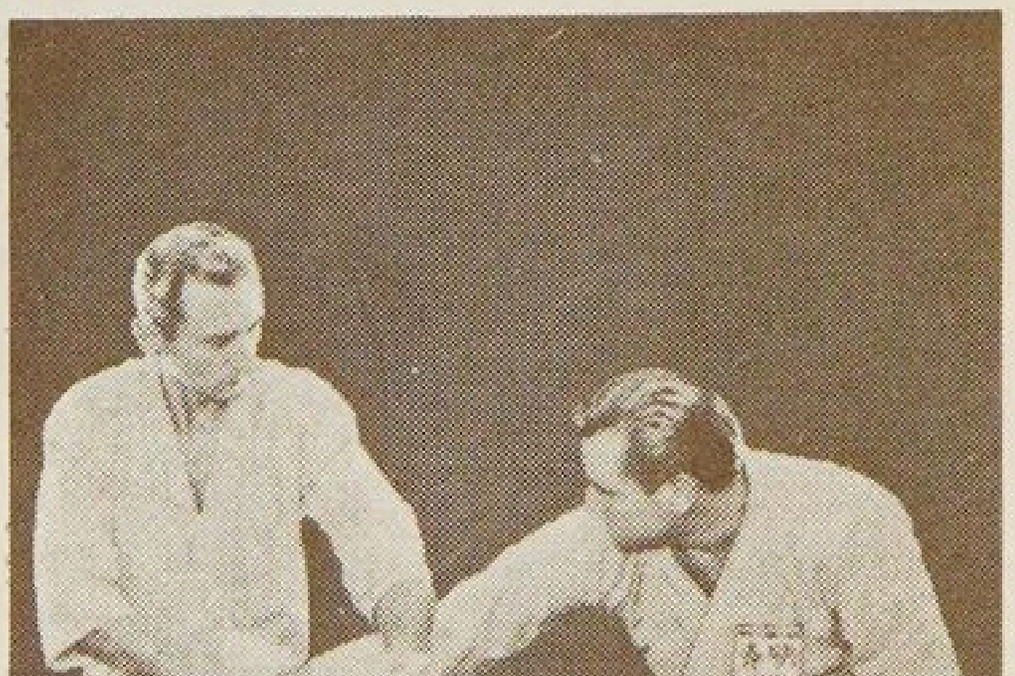
101. Partner shown right does not offer resistance in this beginning practice; he merely allows you to apply the technique for training purposes. Using a natural grip, grasp his wrist with your right hand.

102. With your right foot, step back into a T-position as you pull his held wrist forward, turning his arm over (clockwise) as you pull, so that the back of his elbow is up. Maintaining your grip on his held wrist, place your forearm onto the back of his elbow and press down. In practice, you will press down slowly and gently until your partner feels the pressure of the properly applied hold and taps for release. Do not smash down onto the elbow joint.

101



102

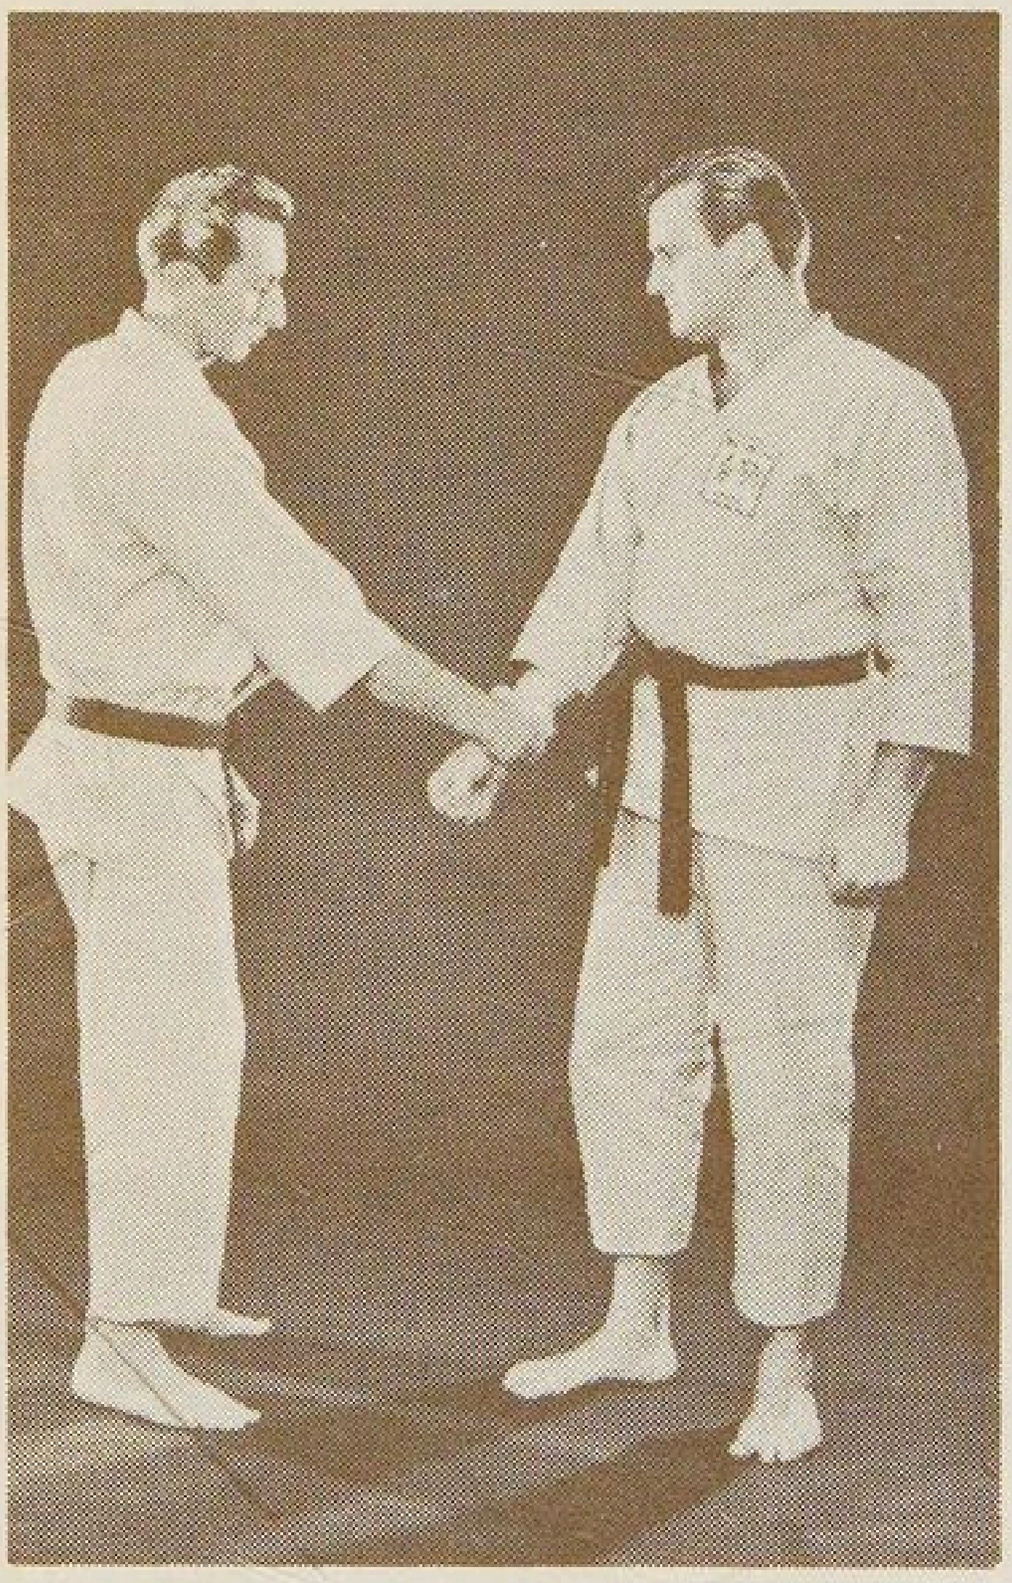


Straight Arm Lock — Side

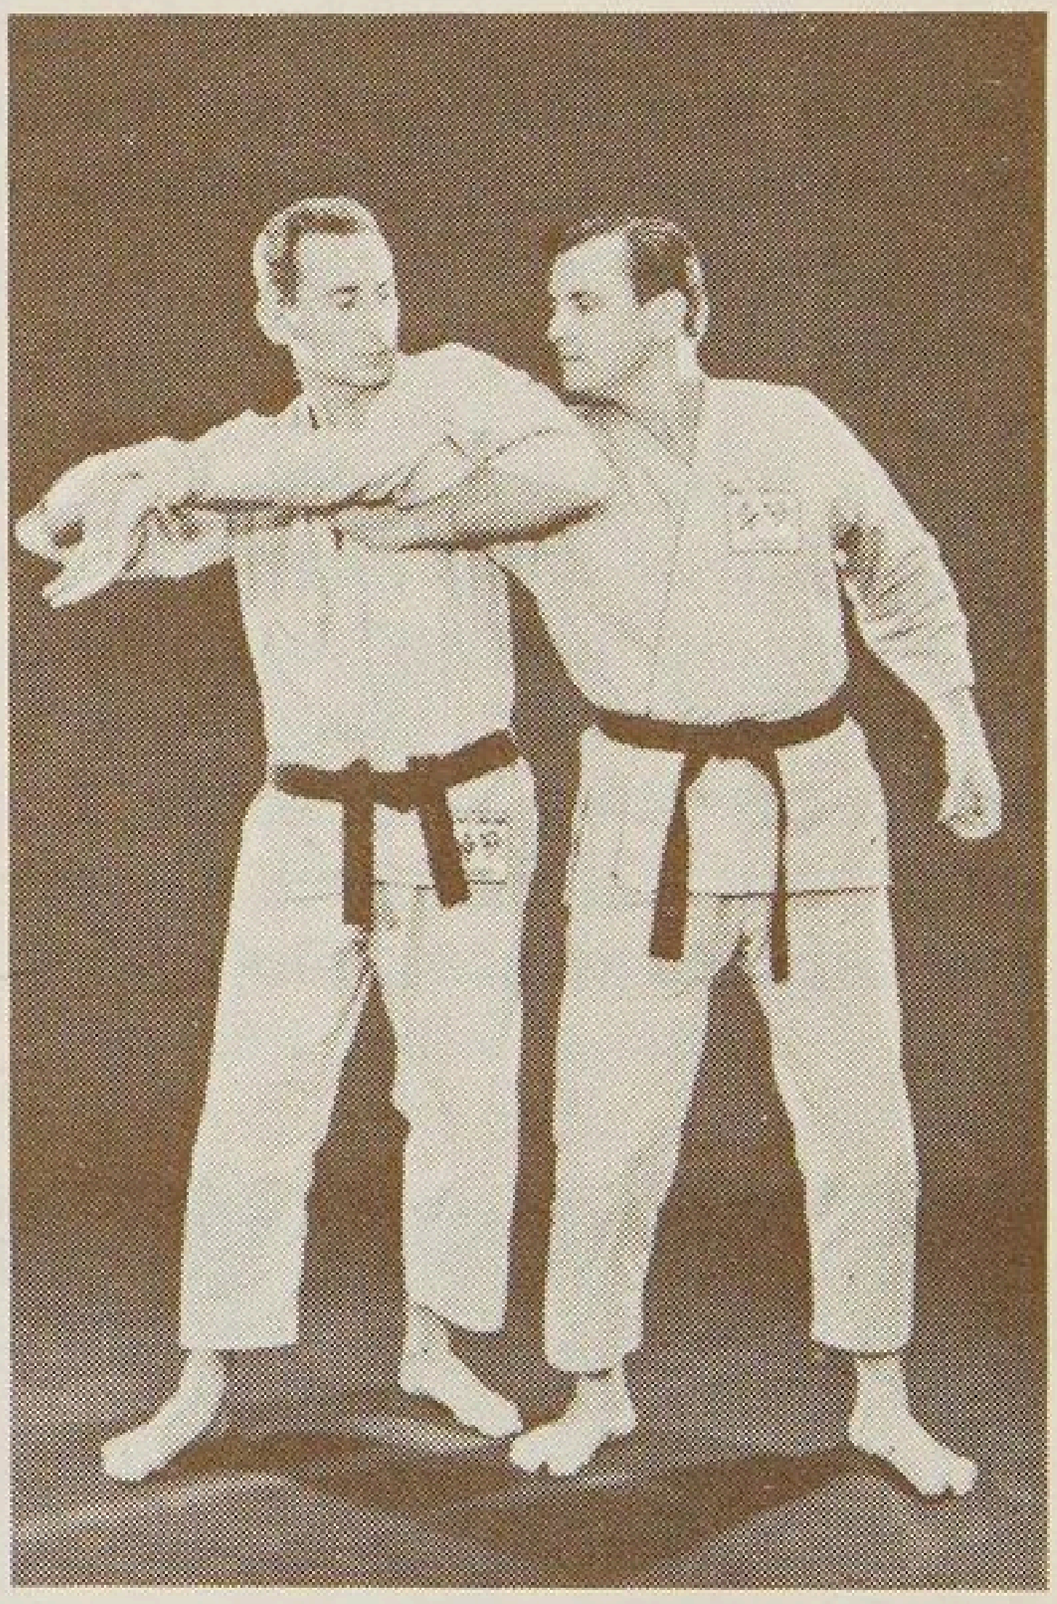
103. Partner at right allows you to apply lock without resisting. You grasp his right wrist with your right hand in a natural grip.

104. Take a step with your right foot to place yourself at his left side. As you step, pull his held arm straight and turn it palm up. Reach *over* his held arm with your left hand and then under his held arm so that you can grip cloth at your own lapel. Your left forearm must be placed at the area midway between his elbow and shoulder, where the nerve center is. If you place your arm too high toward the shoulder, the lock is altogether ineffective.

103



104



Front Bent Arm Lock

105. Partner at left does not offer resistance; he allows you to apply the lock for practice. Taking a step forward with your left foot, grip his right wrist with your right hand (natural grip) as you simulate a slash into the crook of his elbow. In actual use, the slash would bend and numb the arm.

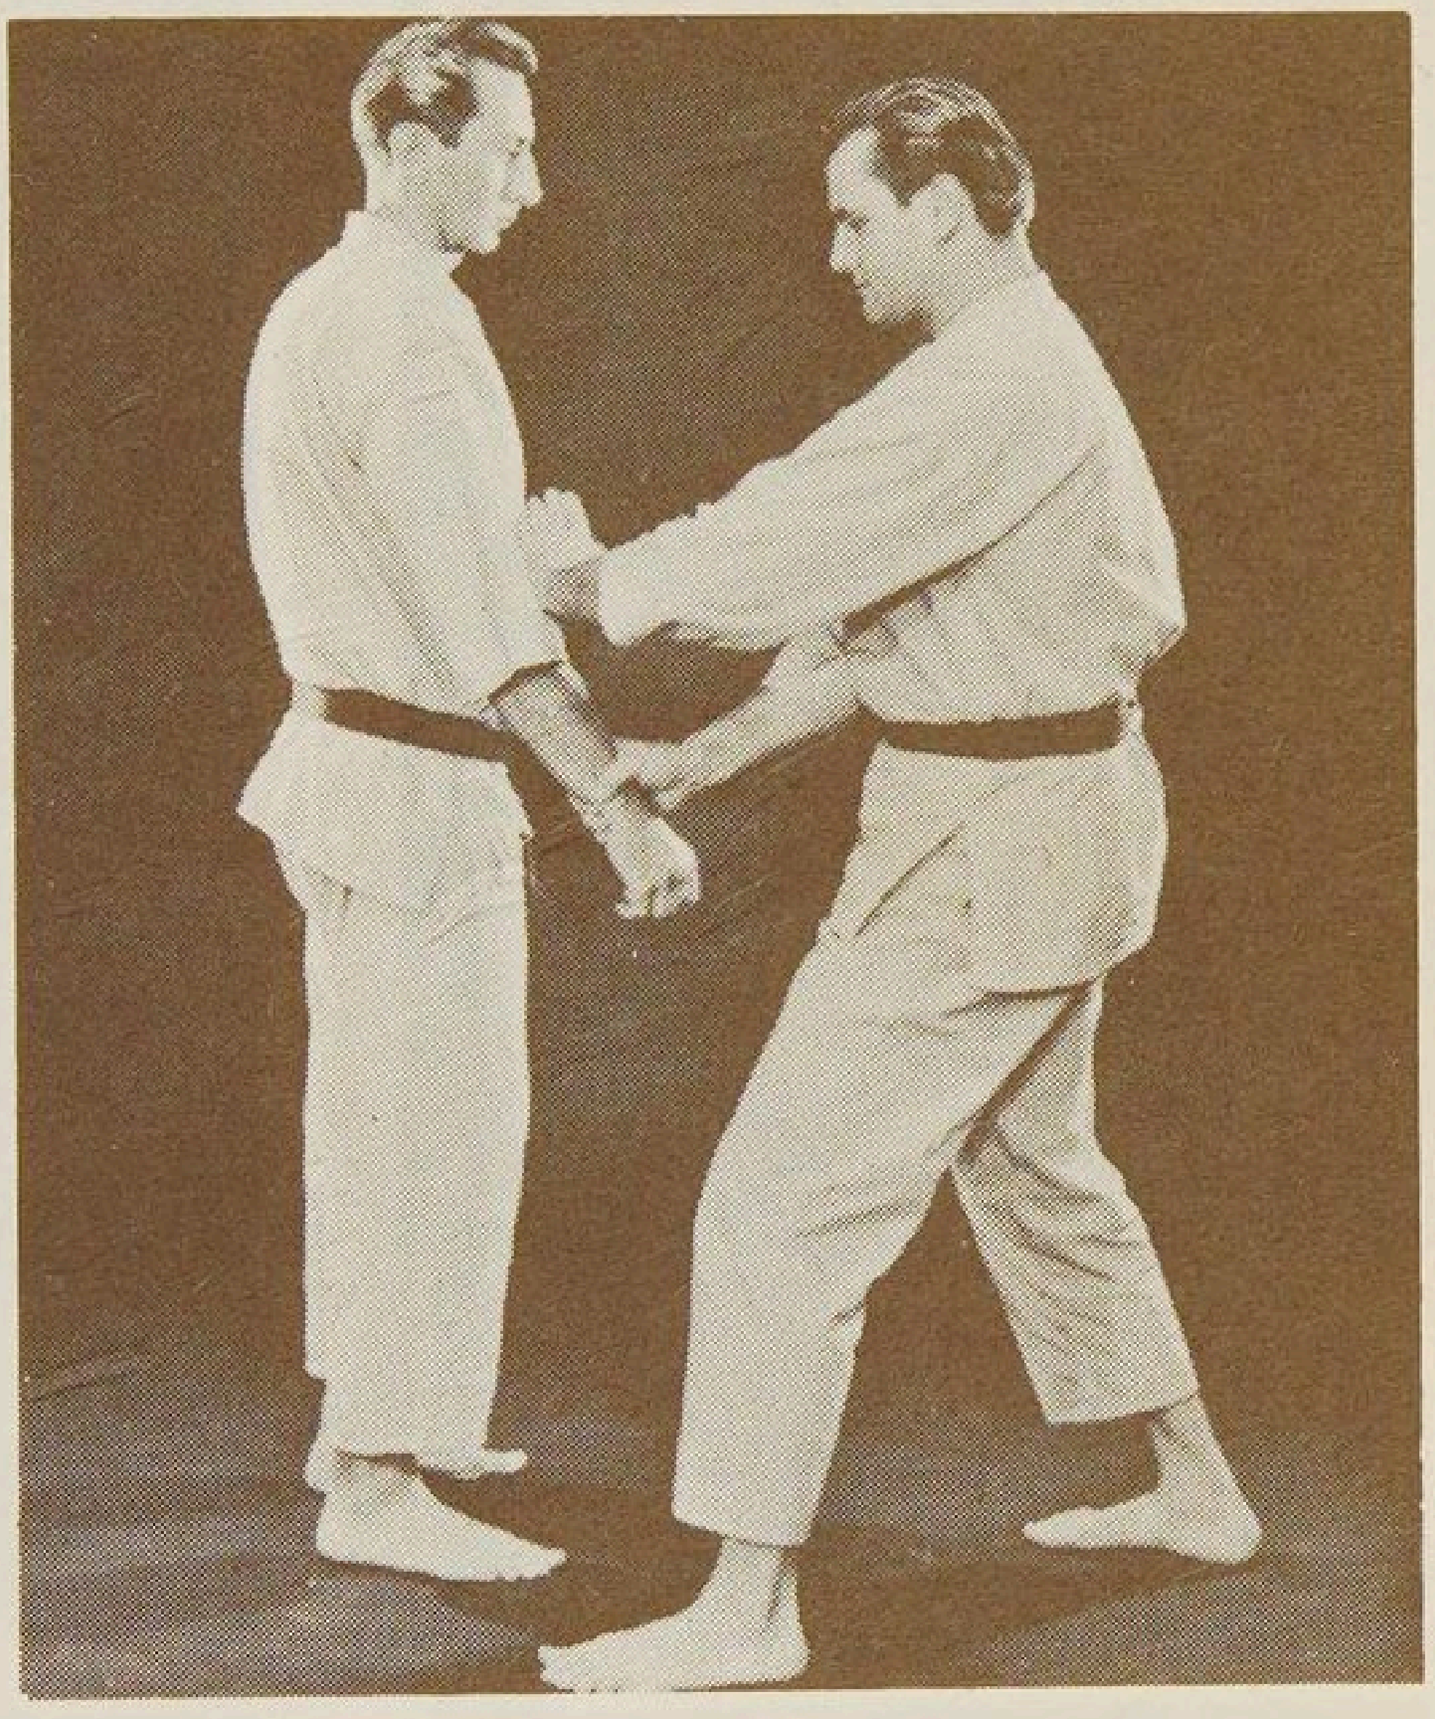
106. Without releasing his held wrist, loosen your grip so that his wrist turns as you do the next action; raise his held arm as shown, as you begin to slide your left hand over his elbow . . .

107. . . . and as you continue bending his held arm, grip your own right wrist with your left hand. As you complete this action,

step in with your right foot close to his right foot; assume T-position.

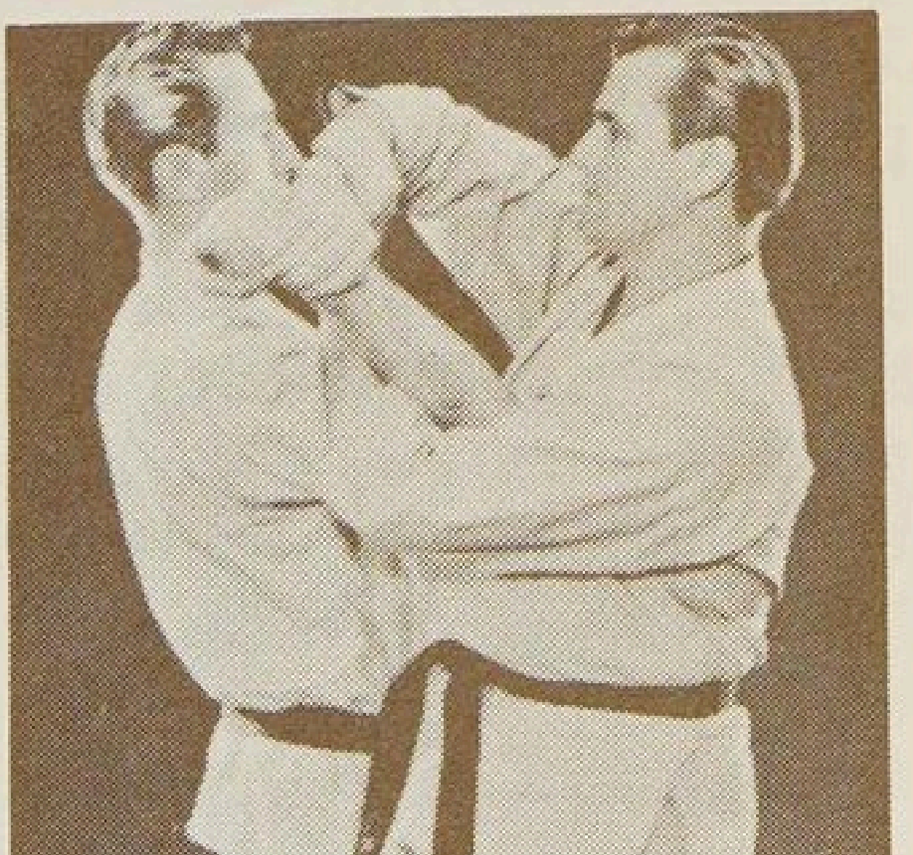
At the finish of the action, his elbow is locked firmly into your chest. Pressure is applied by bowing forward and around to your left. Do this gently at first and release at partner's tapping signal.

105

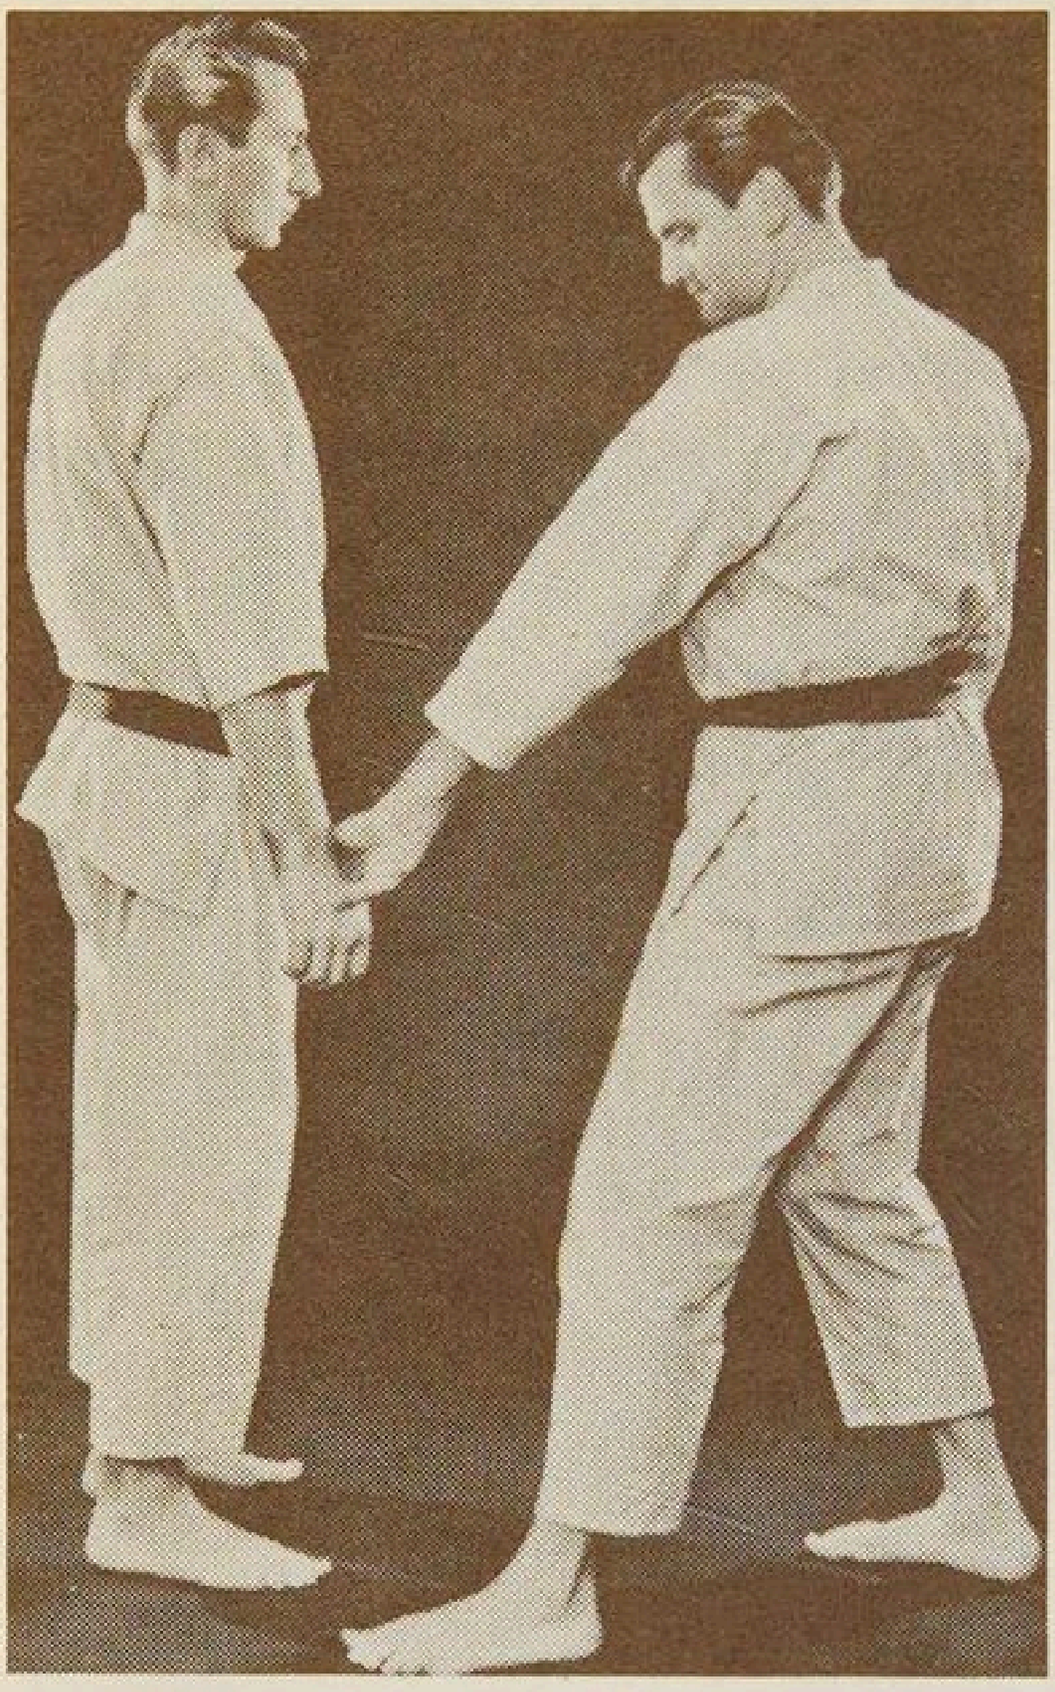


106

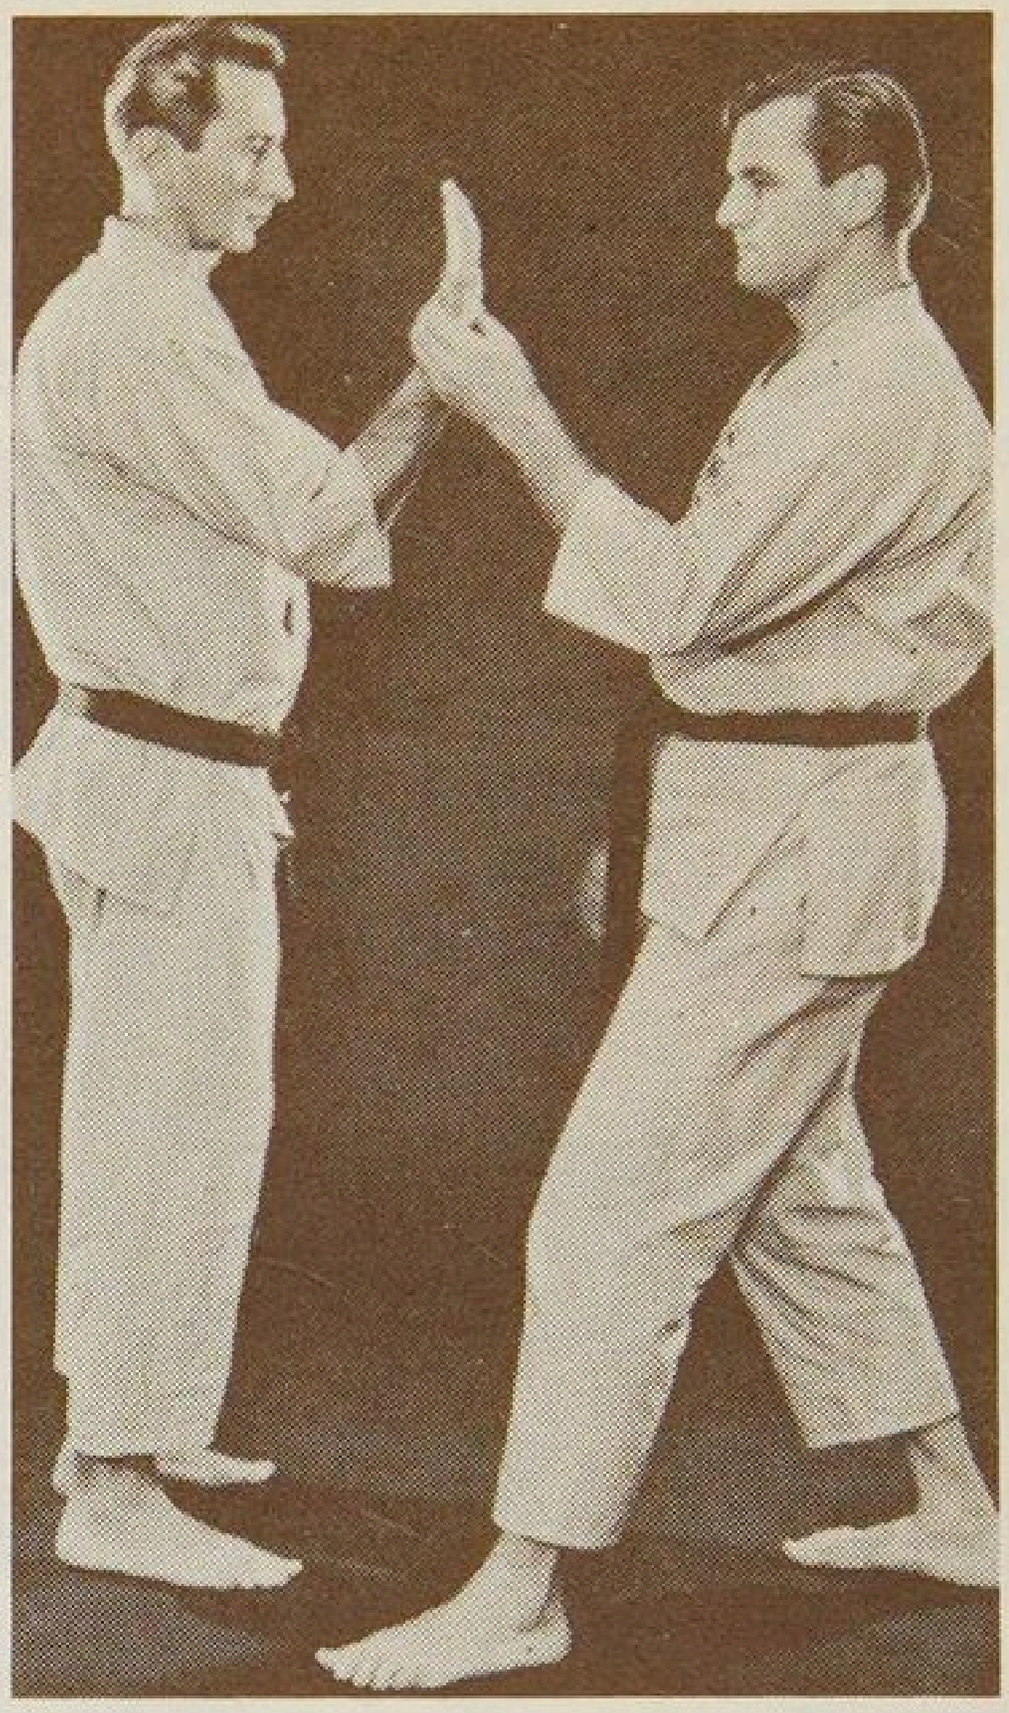
107 →



108



109



First Wrist Hold

108. Partner at left does not offer resistance for training practice. Take a step in with your right foot as you grip his right wrist with your left hand in an unnatural grip.

109. Raise his held arm, turning it counter-clockwise so that his palm is turned toward his face.

110. With your right hand, grip his held hand using the unnatural grip. Now both of your hands are holding his right hand; your thumbs are at the back of his hand and your grip should not be on his fingers, but on his palms. As you grip with the right hand, take a step with your right foot, assuming T-position. Pressure is applied by placing your right elbow at his chest and bowing forward and counter-clockwise until he taps for release.

Bent Arm Lock — Rear

111. Partner at left offers no resistance as you grip his right wrist with both hands in a natural grip and step in with your left foot.

112. Raise his held arm so that you can duck under it without releasing your grip and without hesitation . . .

113. . . . take another step with your right foot and then pivot on the balls of both feet, turning counter-clockwise so that you are behind him in a T-position. You have not released your grip during this turn; place your left elbow into his shoulder blade. Apply pressure by raising his held wrist until he taps for release.

112 ←

113 →

USES OF HOLDS AND LOCKS: Showing Attack, Defense, and Takedown

Basic Arm Bar

114. As partner shown right reaches out to simulate front grab or similar attack, parry his reaching arm with a slash.

115. Apply basic arm bar.

116. As you apply the pressure, take step forward and put your partner on the ground.

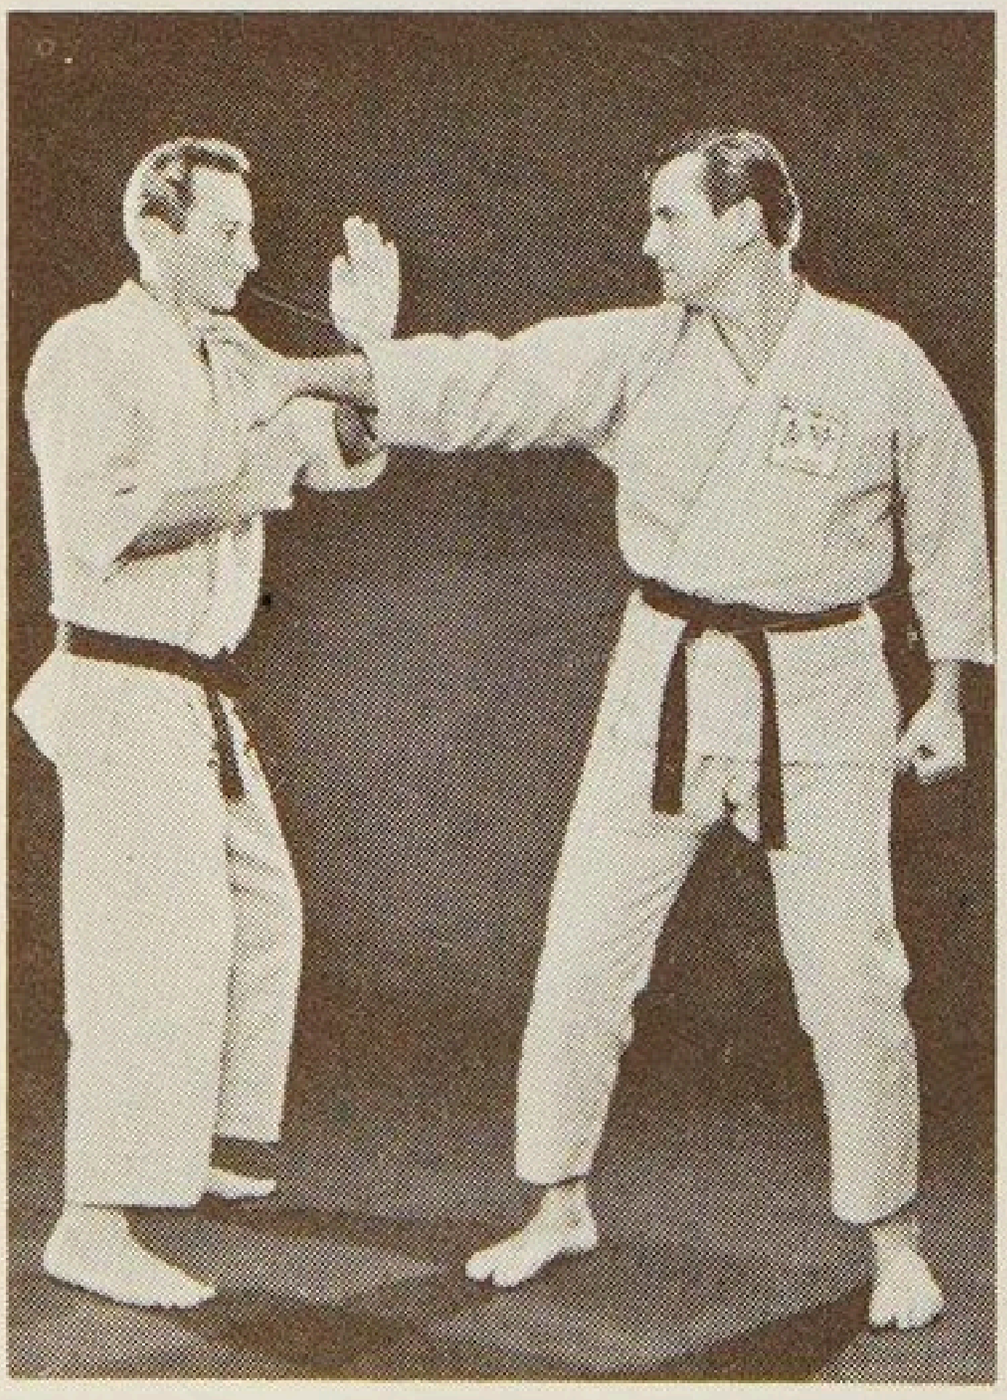
Straight Arm Lock — Side

117. As right partner simulates reaching attack with his right hand, slash his forearm nerve center with your left hand.

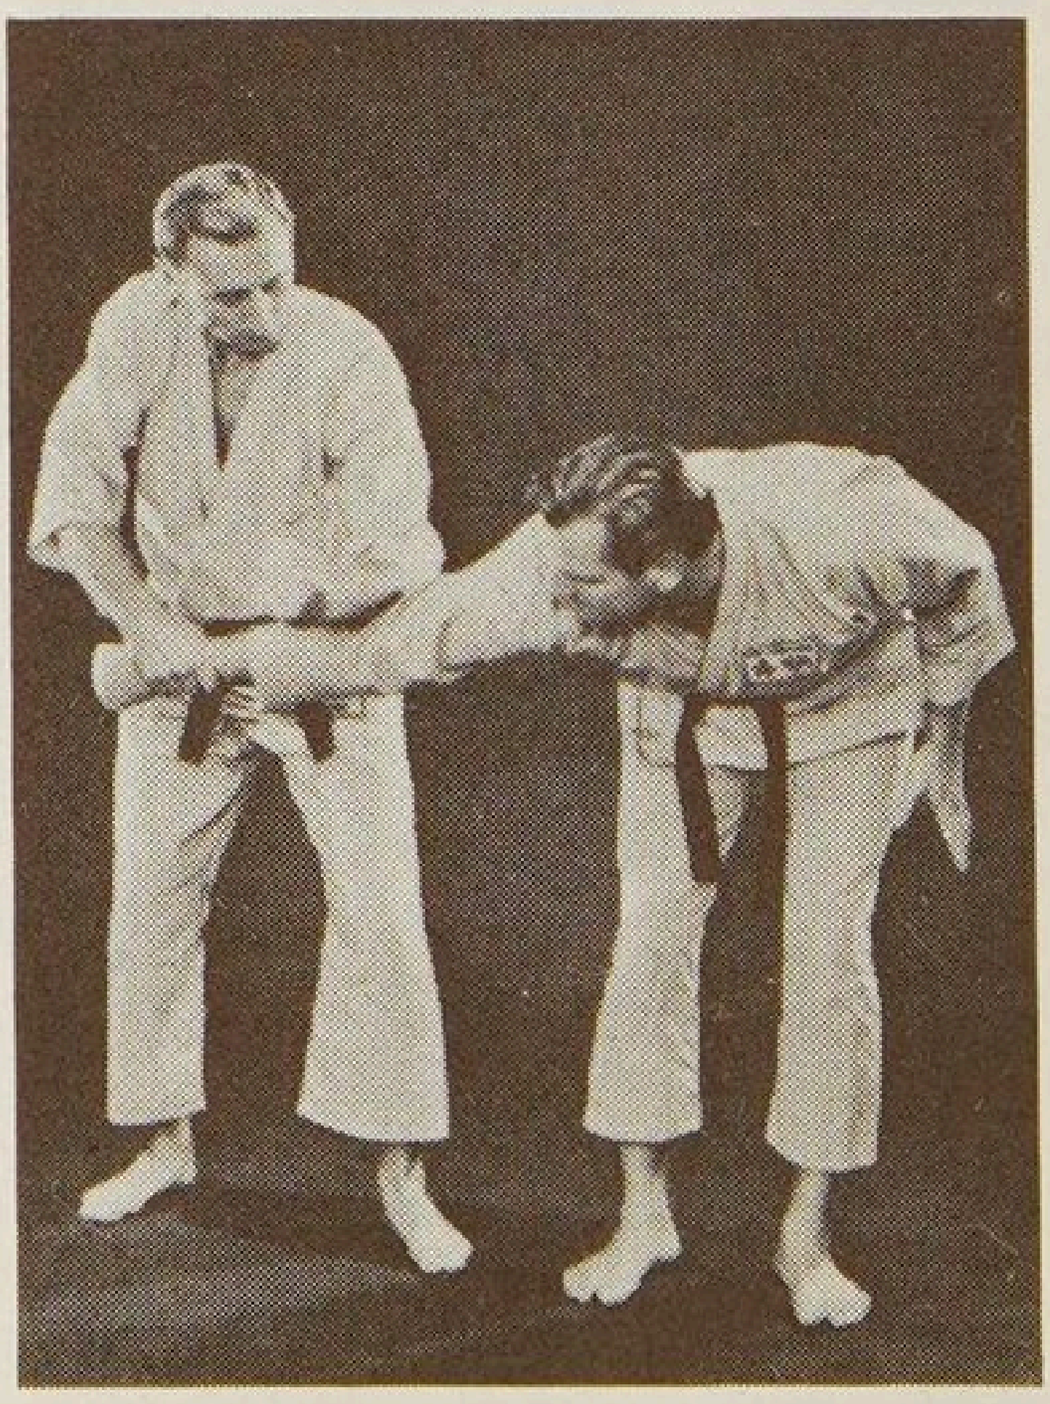
118. Apply straight arm lock from the side.

119. Without releasing your grip, pull him back so that his balance is weak and sweep his right foot forward with your left foot . . .

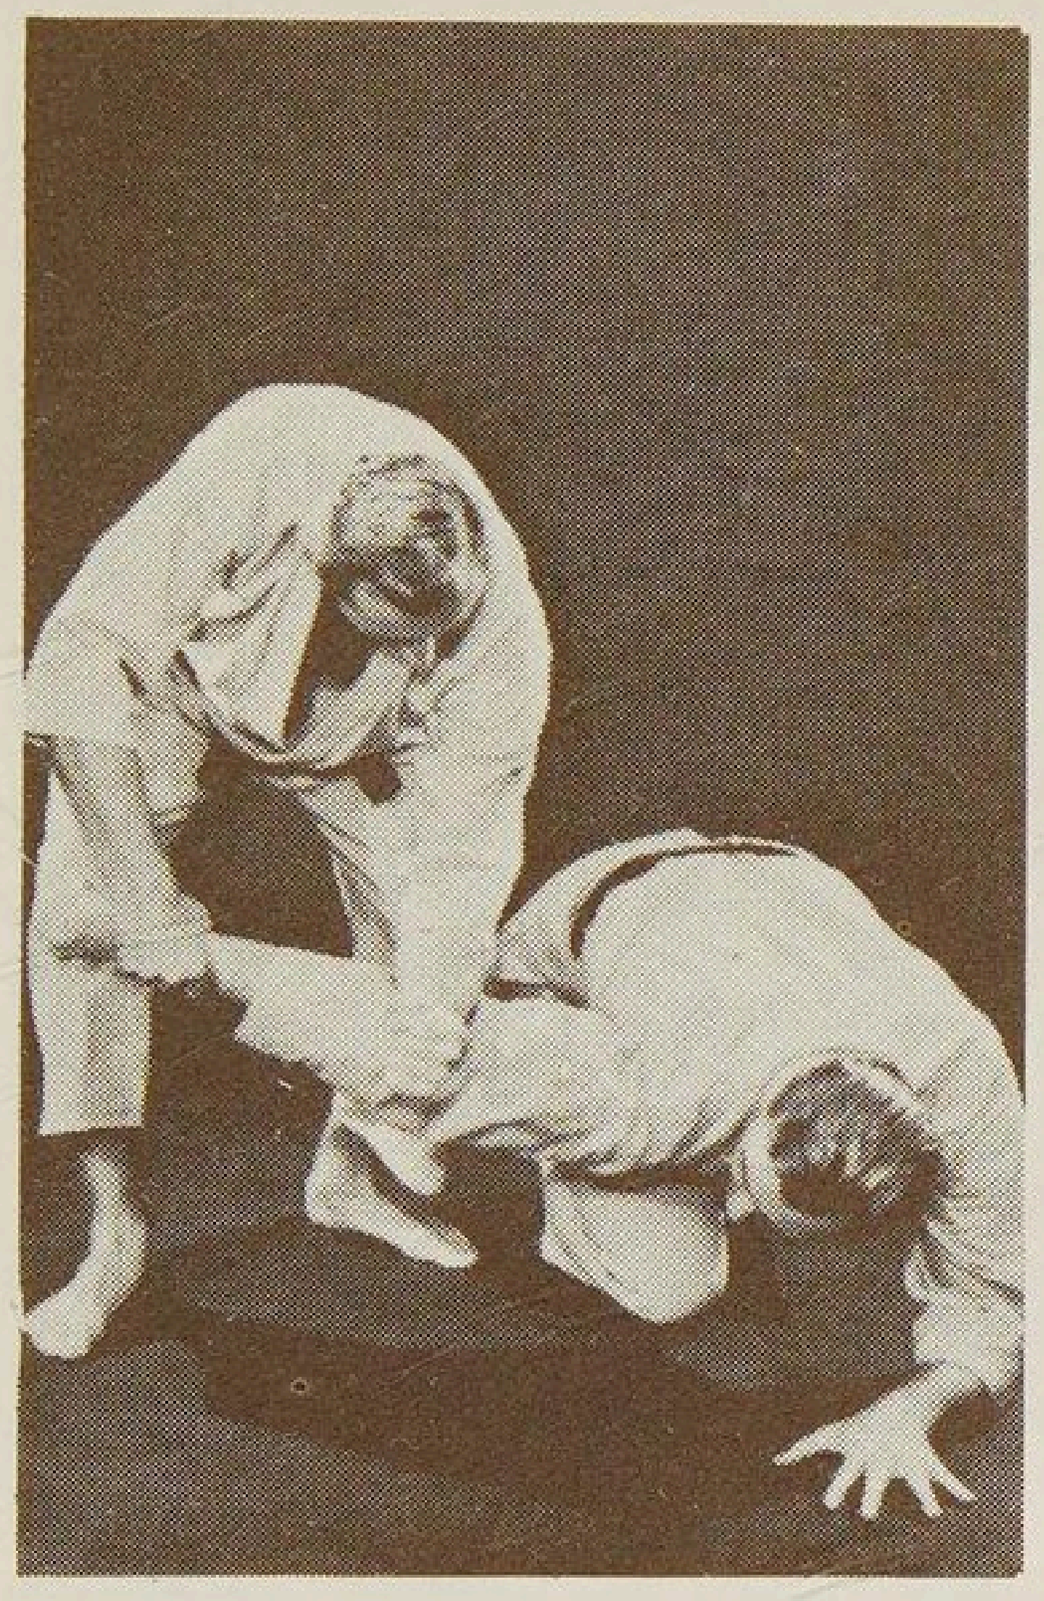
114



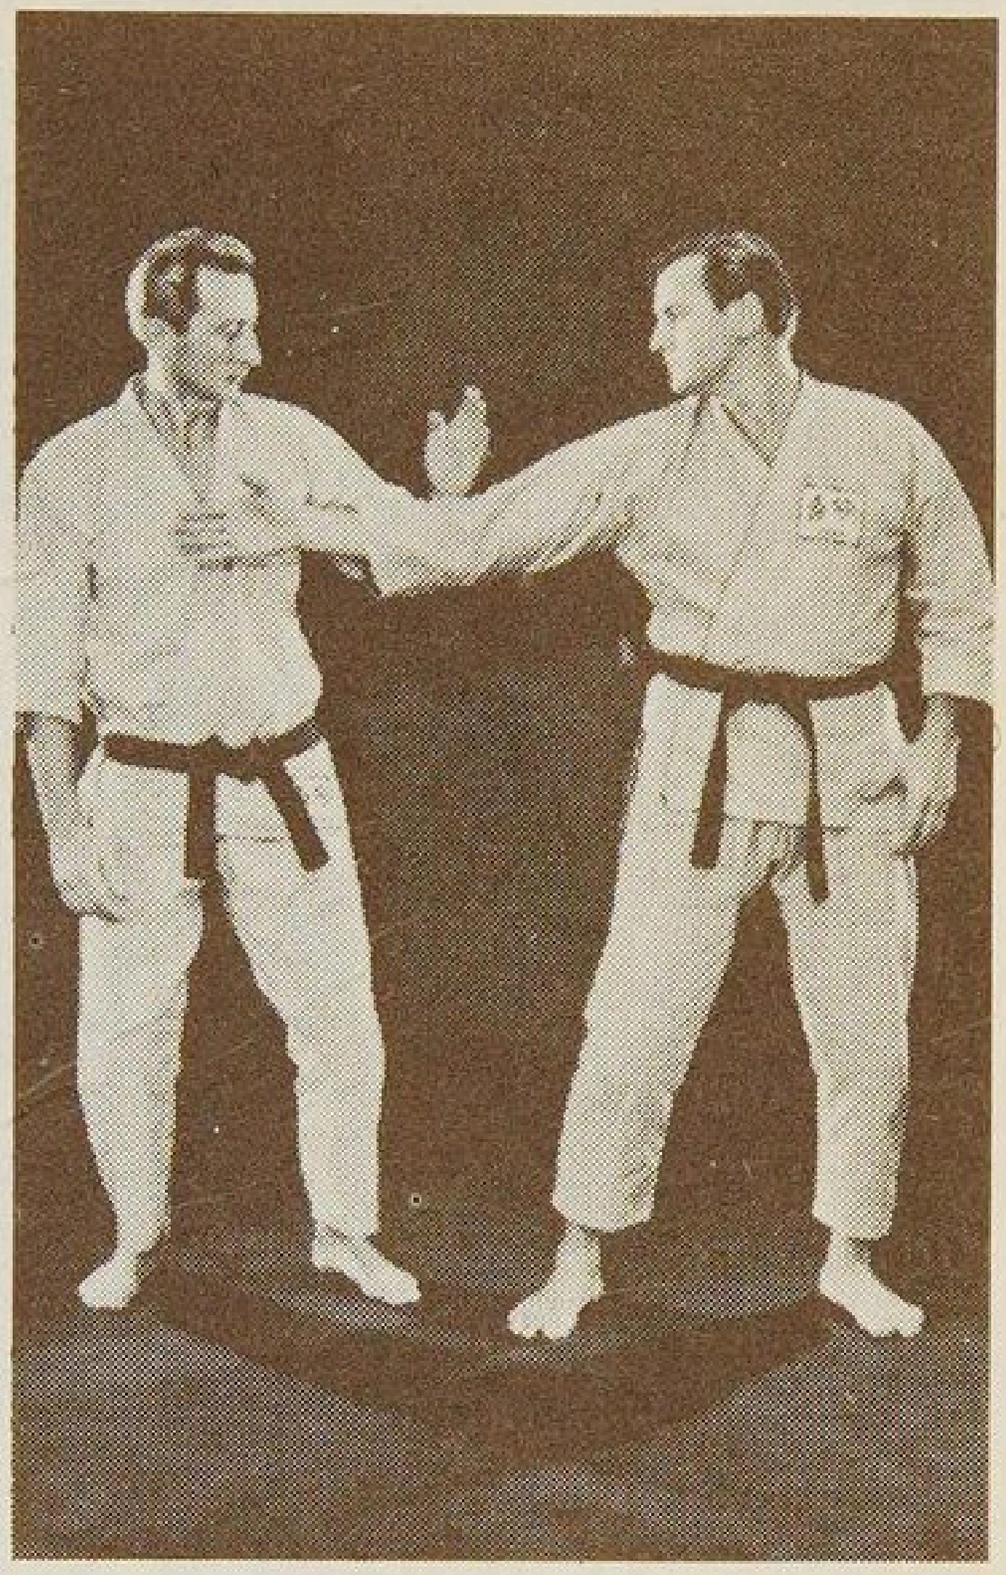
115



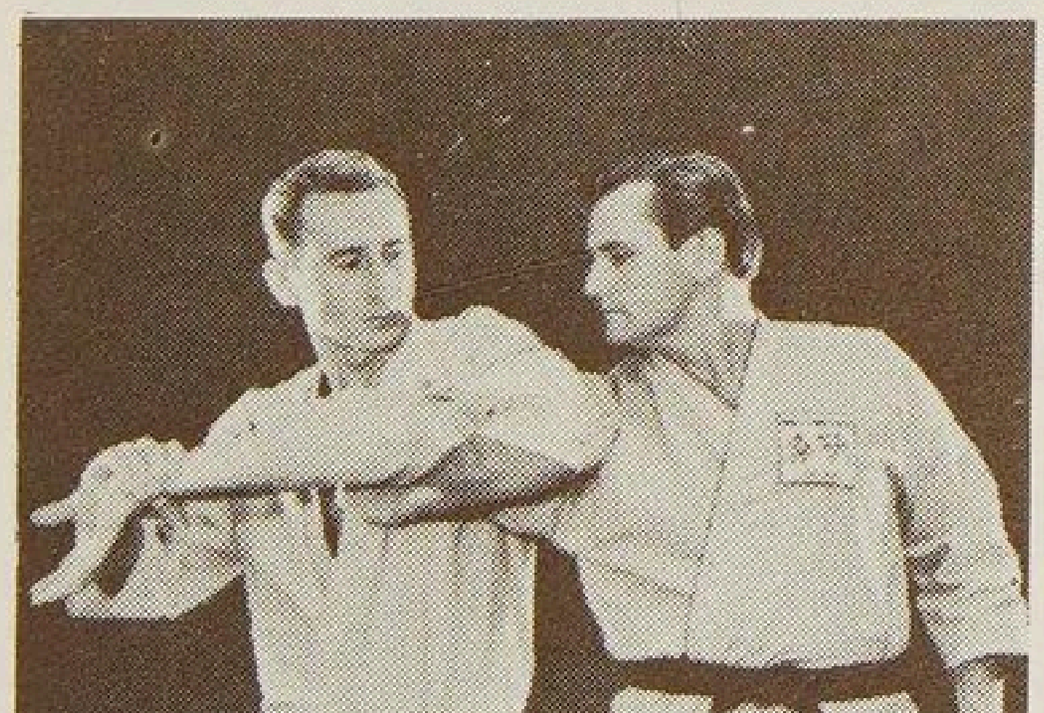
116



117

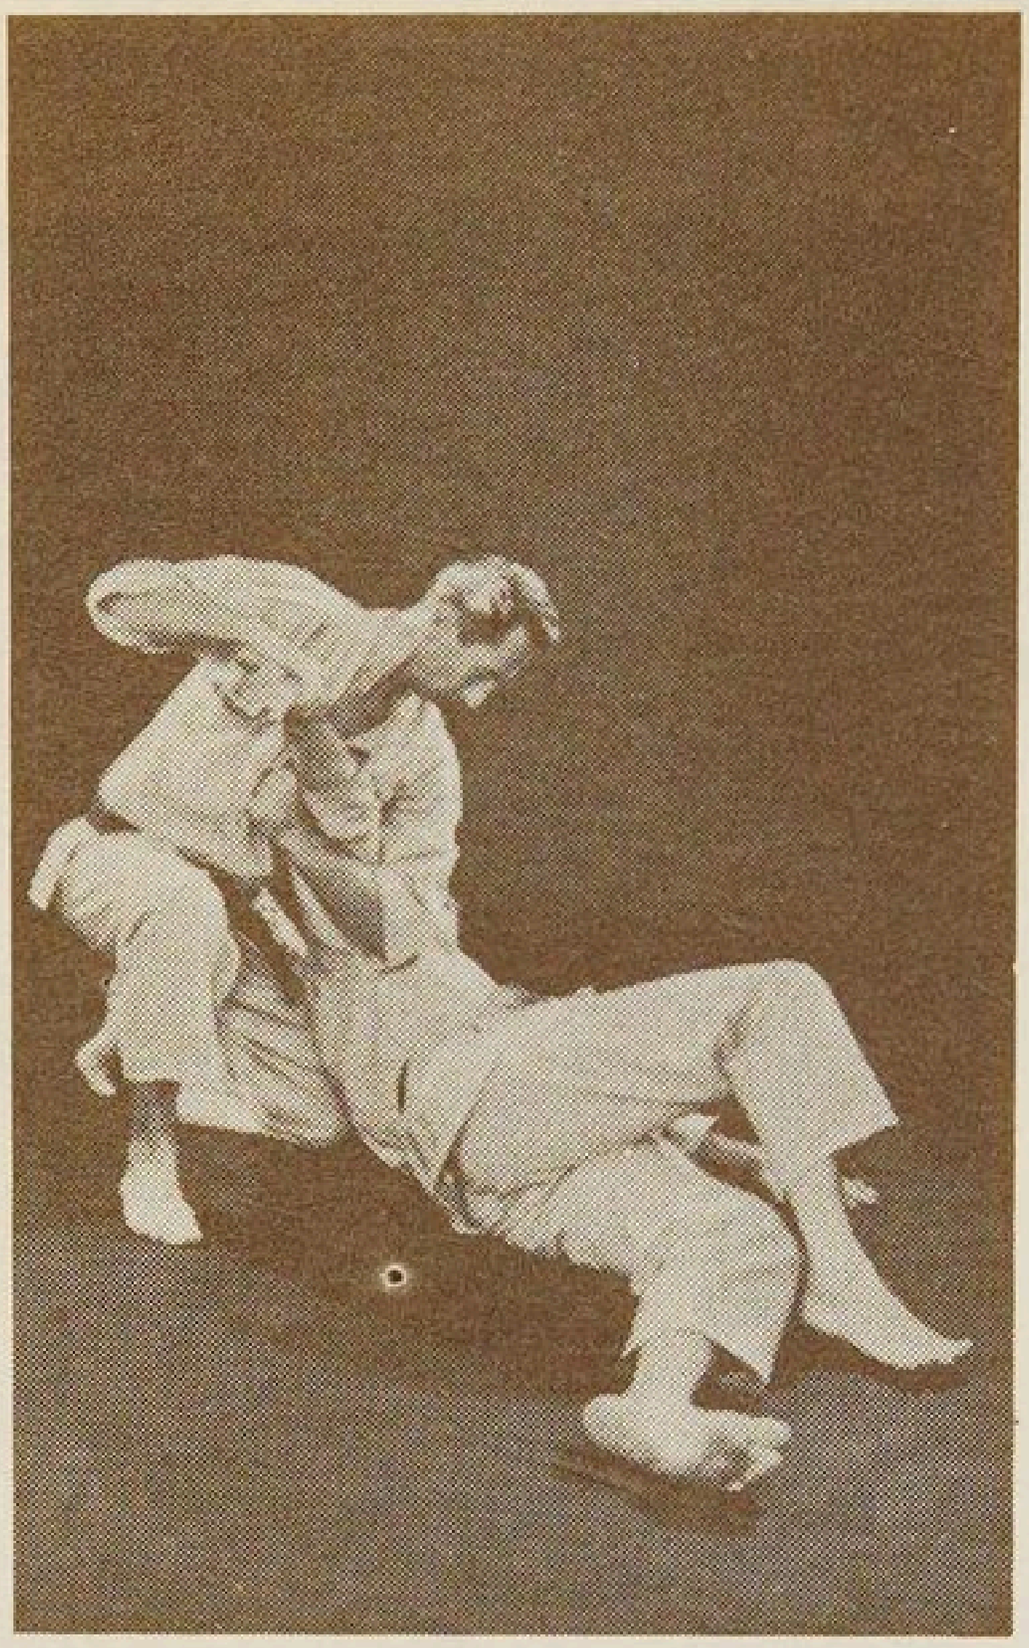


118

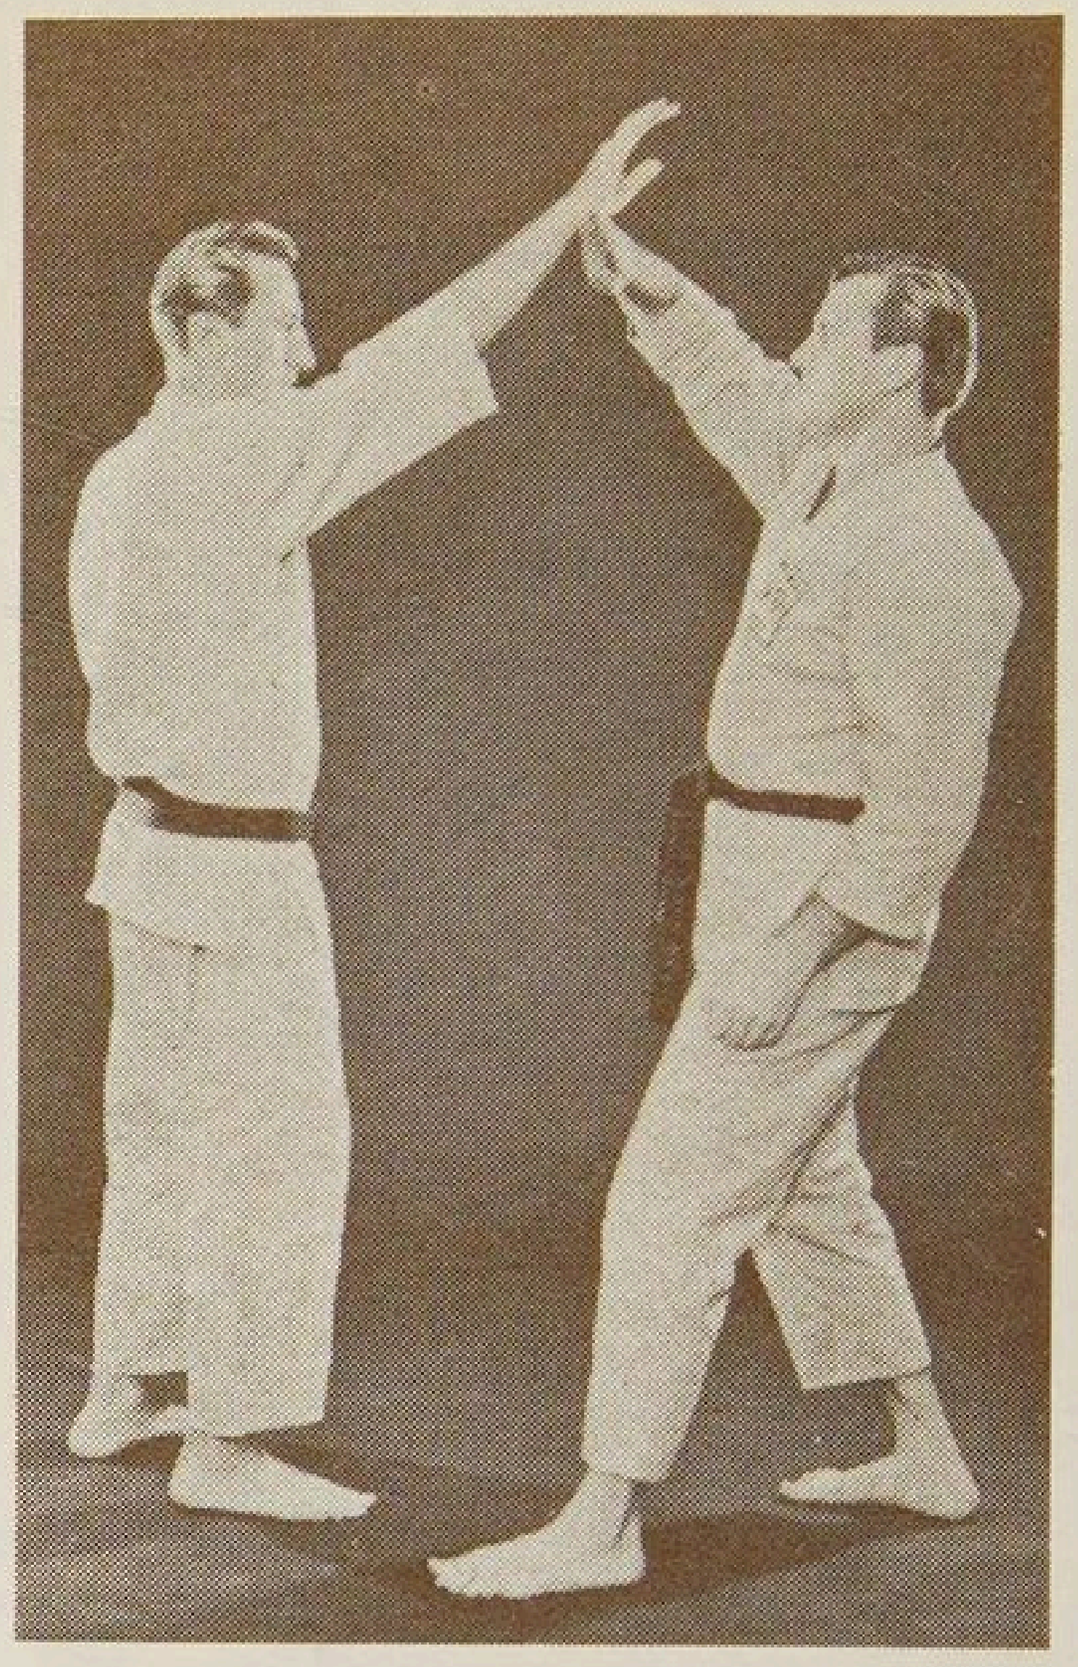


119

120



121



120. . . . placing him on the ground. Follow him down smoothly so that you do not hurt him in practice.

Front Bent Arm Lock

121. As left partner simulates high reaching attack, step in with your left foot and block upward with your right hand or forearm.

122. Grip his wrist and apply front bent arm lock.

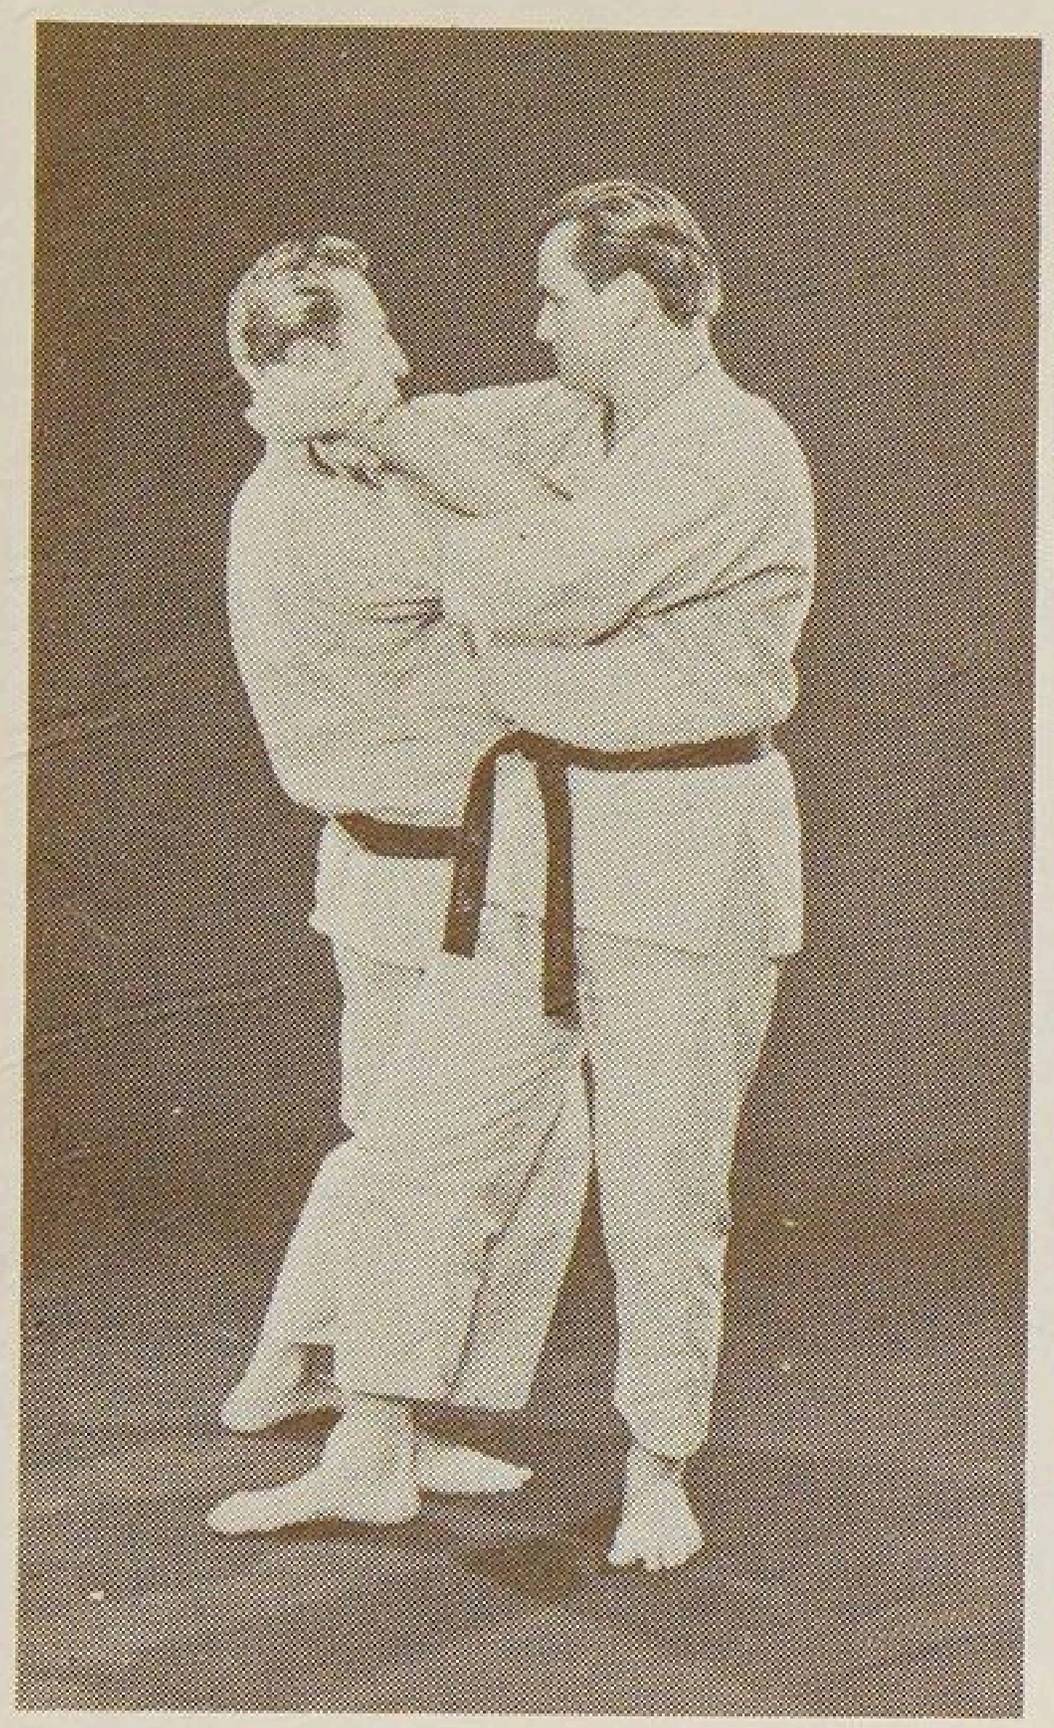
123. Place your right foot behind him and simulate kicking his right leg from under him . . .

124. . . . placing him on the ground without releasing your lock. You must practice this very slowly and follow his body actions with your body so that you do not hurt him in practice.

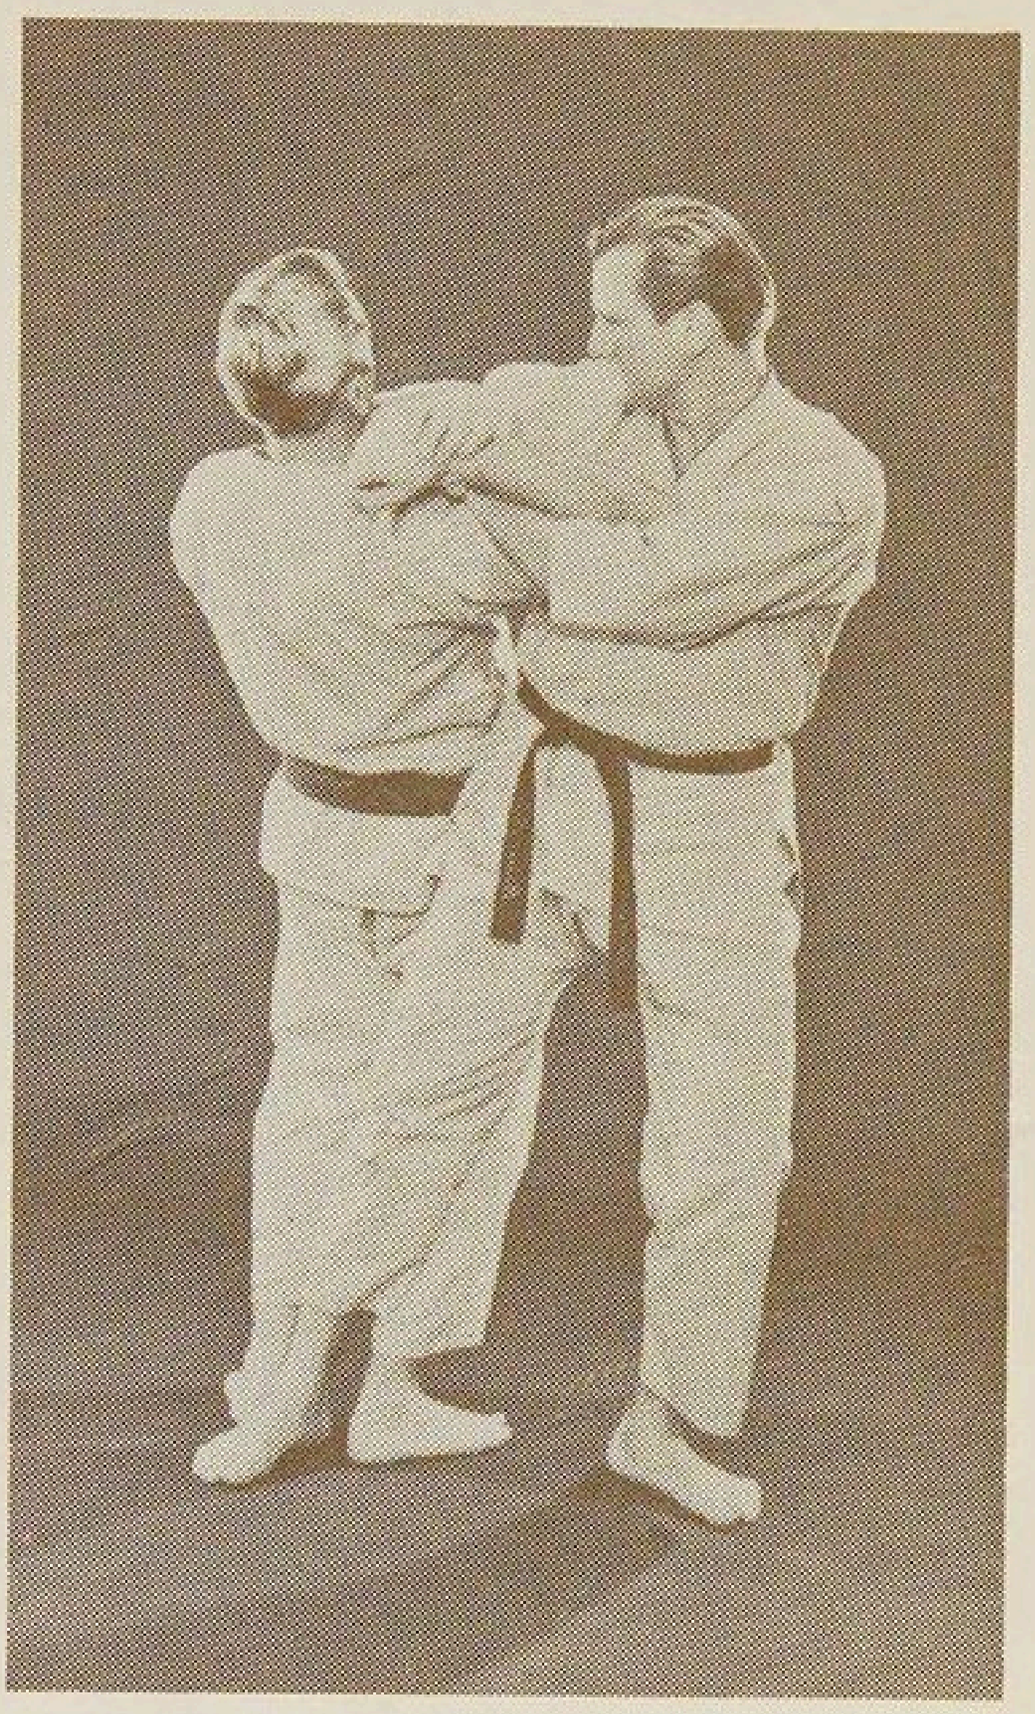
First Wrist Hold

125. Left partner grips your lapel with his right hand.

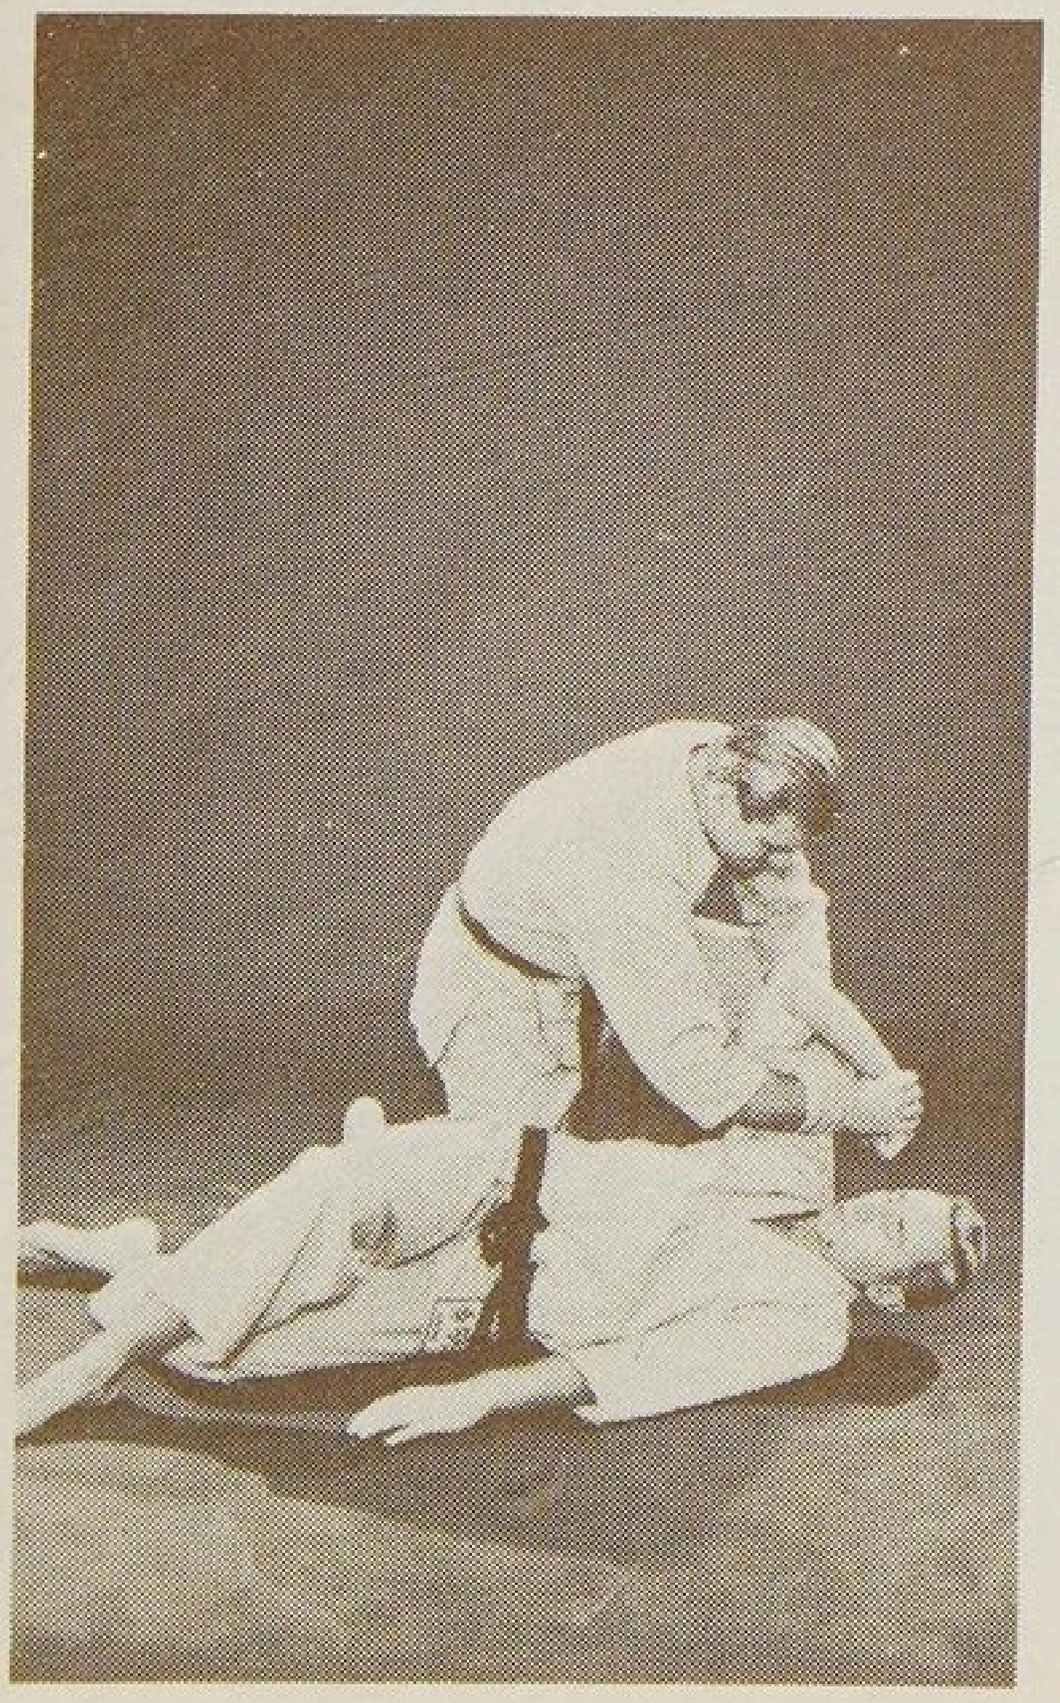
122



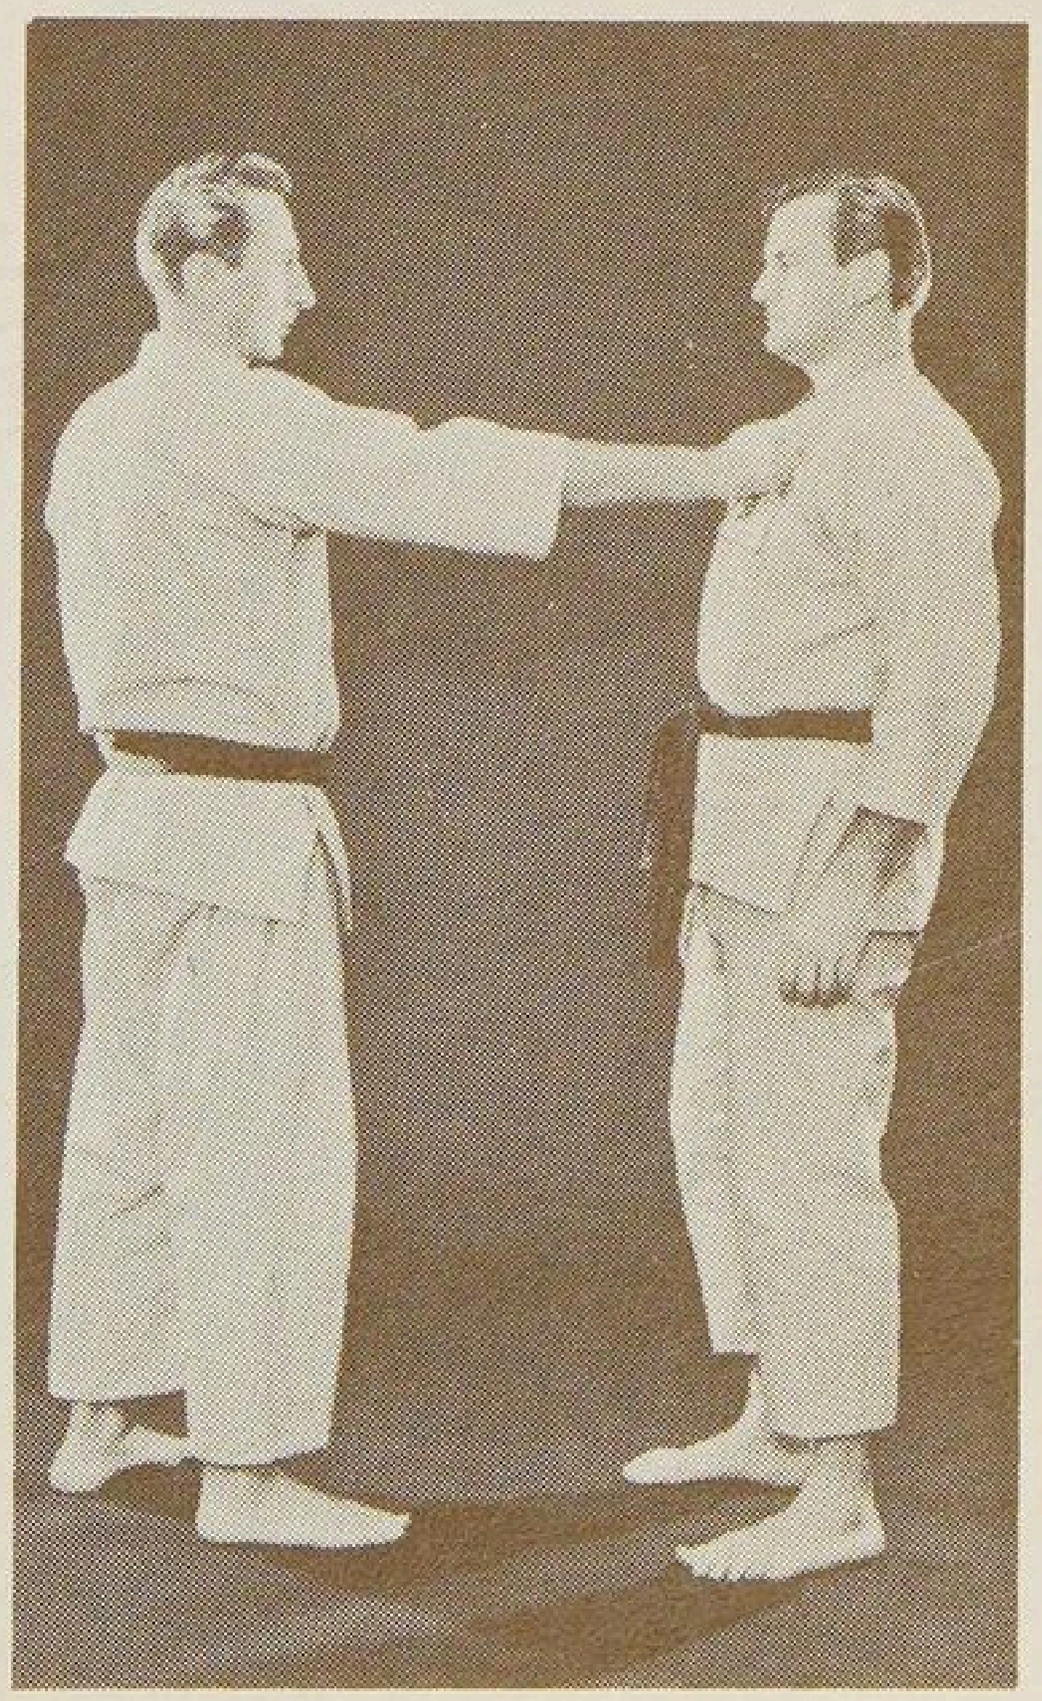
123



124



125



126. Apply first wrist hold.

127. Without releasing your grip, kick his right leg out from under him so that you put him on the ground. Follow his body actions with yours so that you do not hurt your partner in practice.

Bent Arm Lock — Rear

128. Left partner simulates attack; he grips your belt.

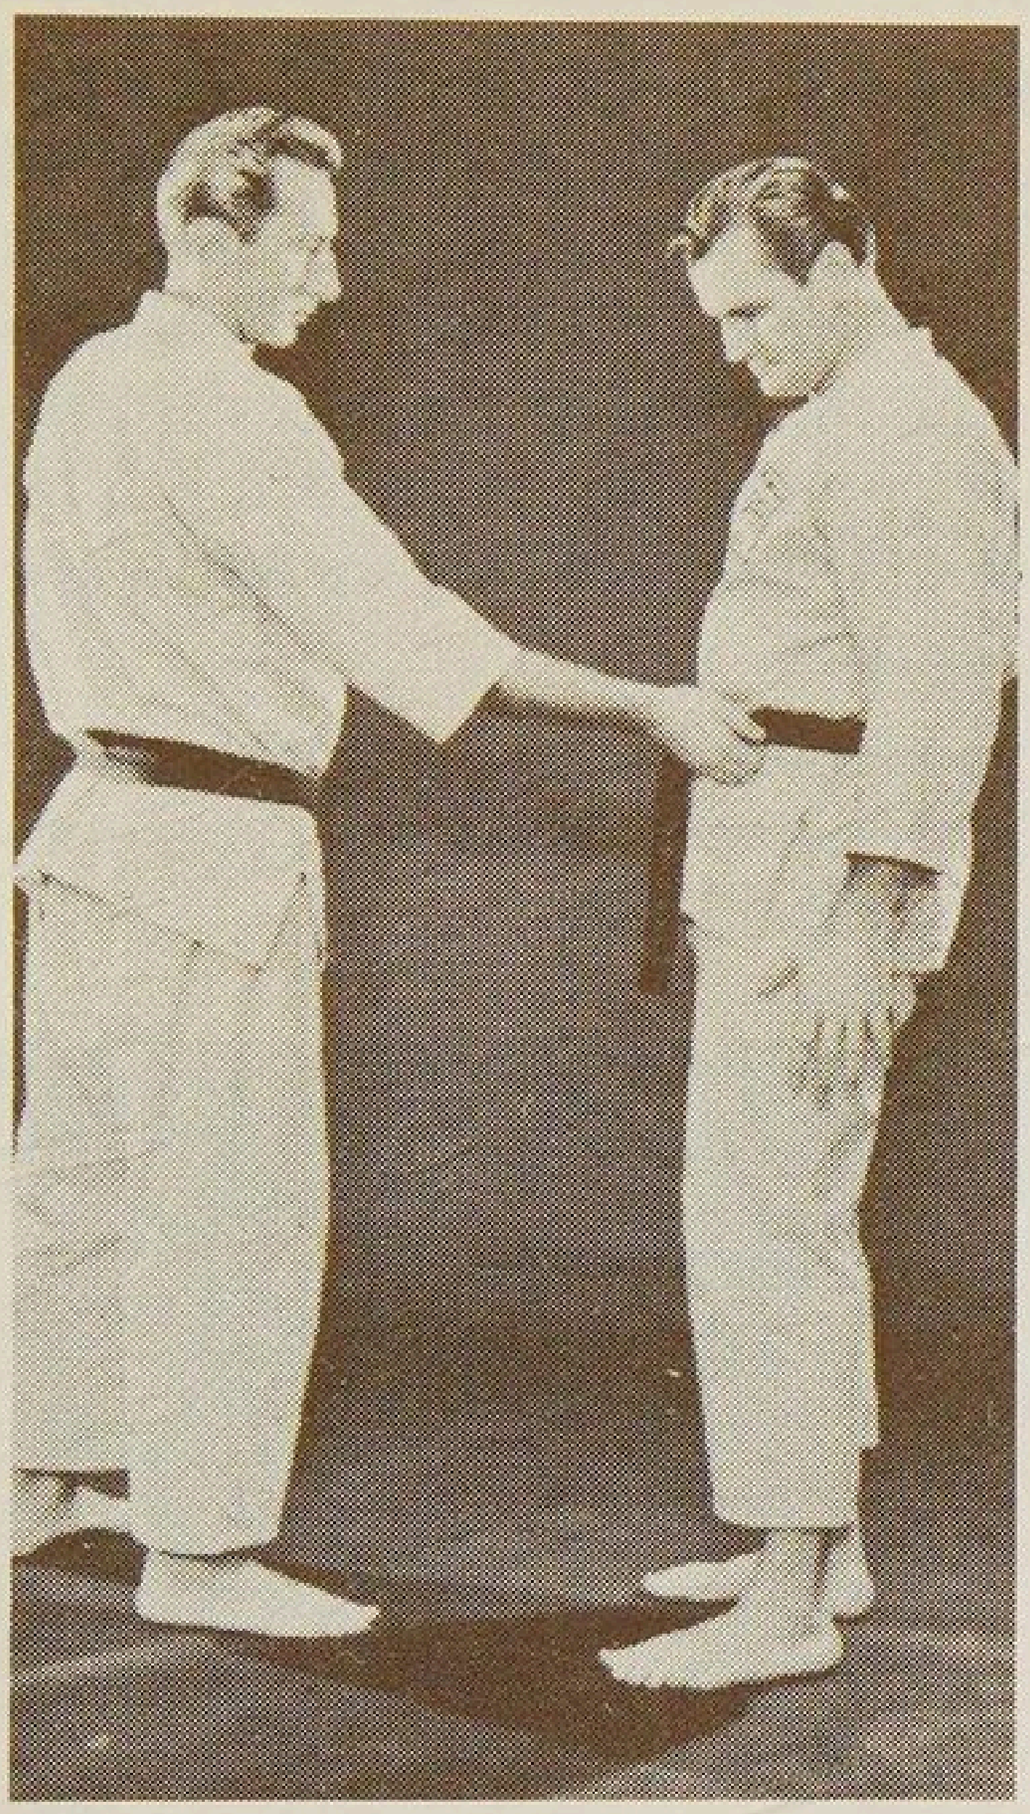
129, 130. Simulating a slash into the elbow (or forearm) nerve, apply bent arm lock and . . .

131. . . . maintaining your grip on his captured wrist with your left hand, grip his collar with your right hand; place your left foot behind his knee and press (simulating a kick). Set him on the ground and follow his body action with yours.

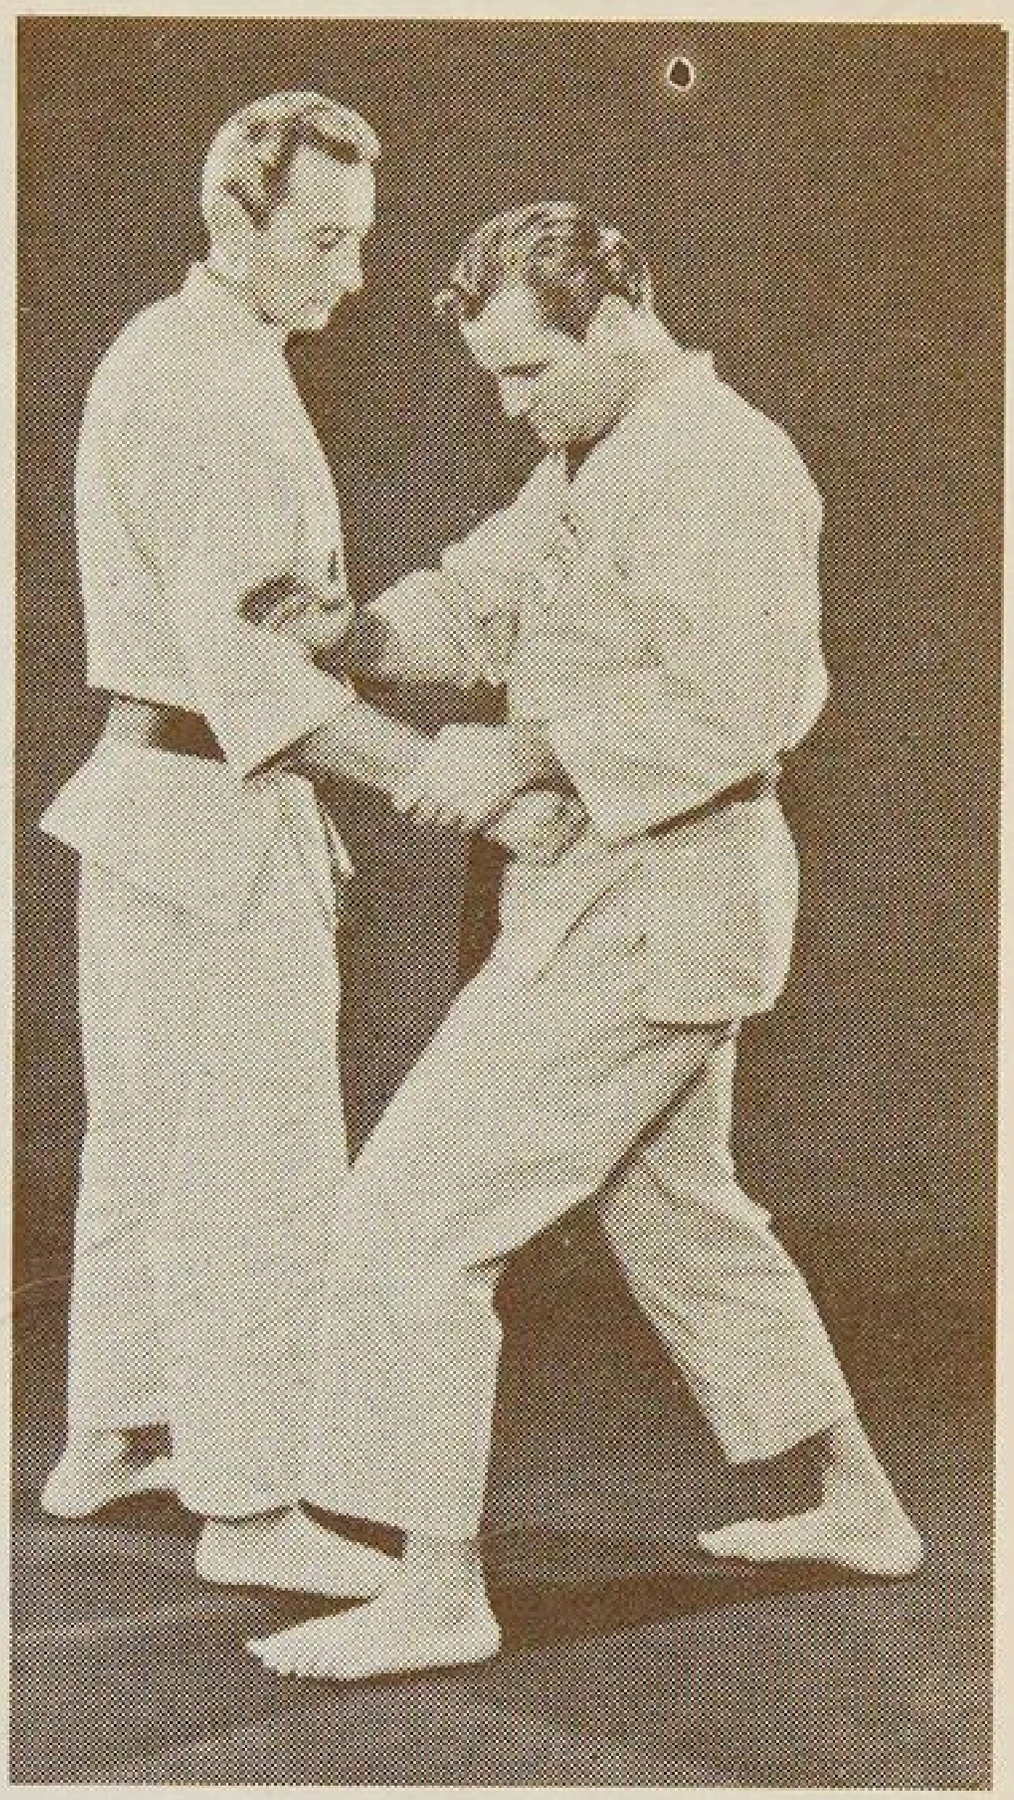
126

127

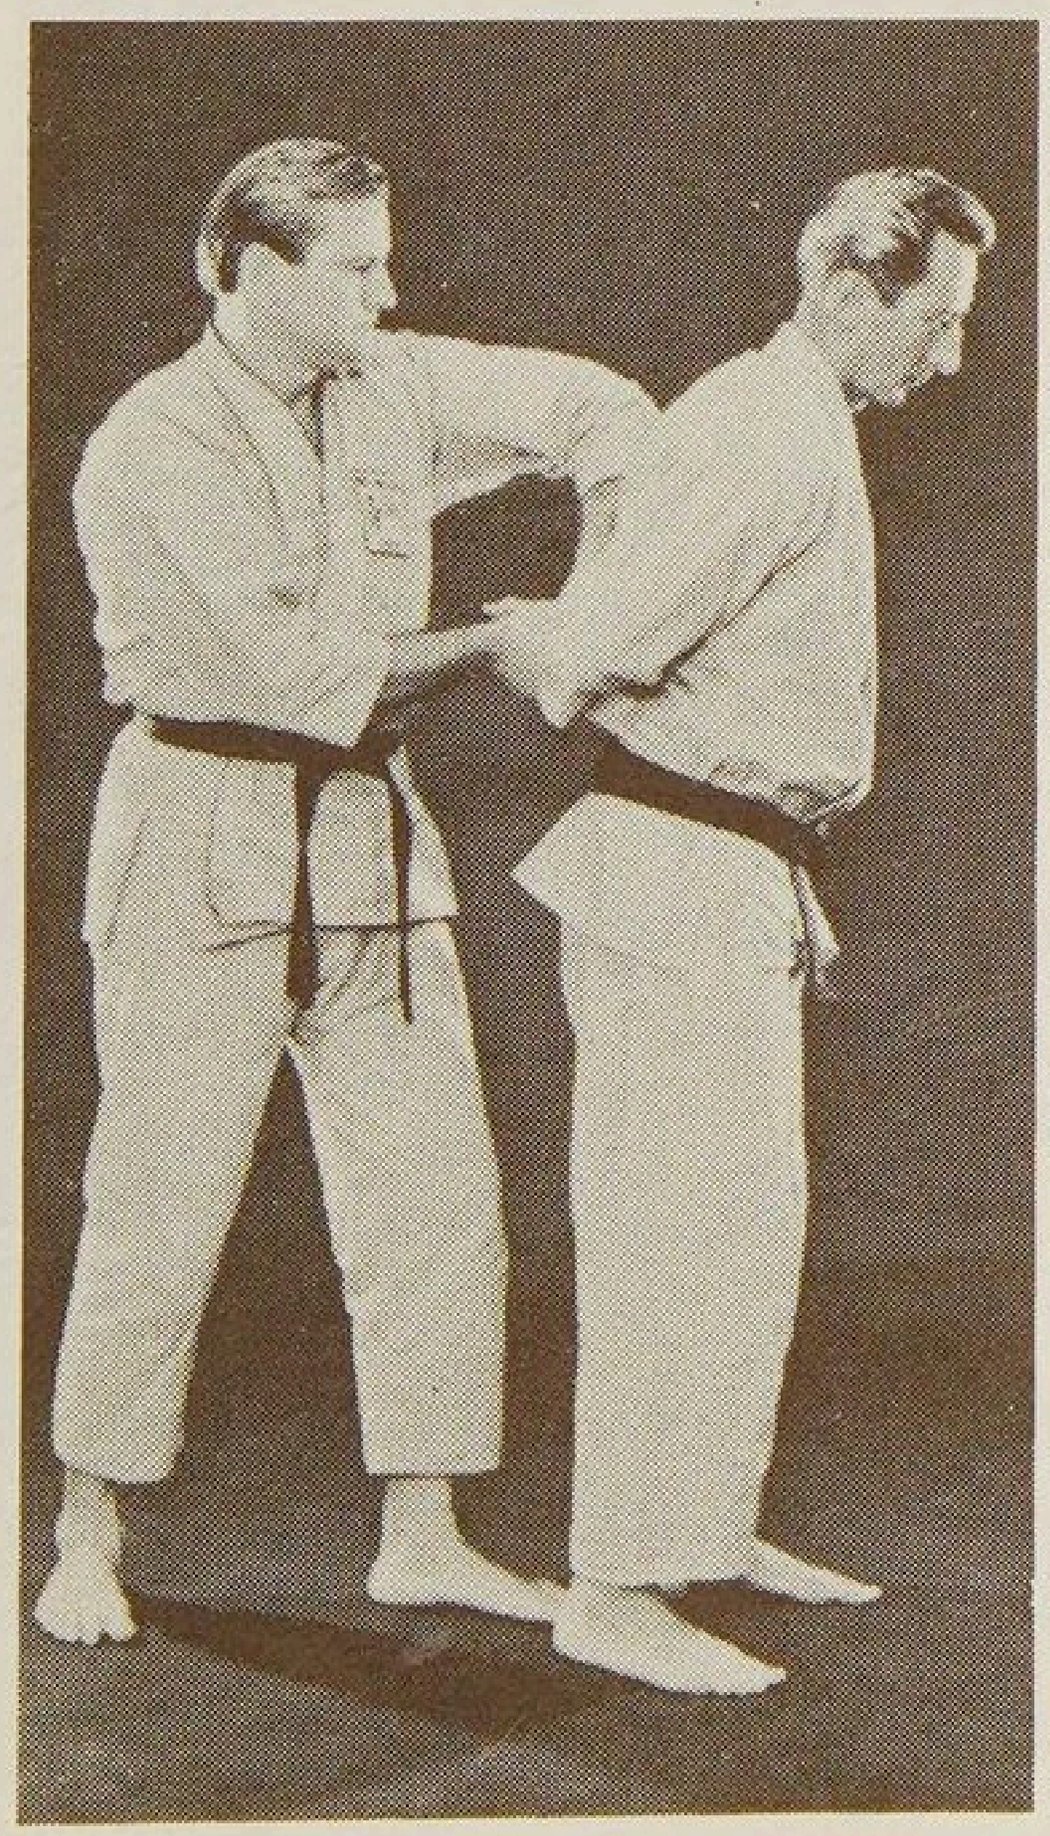
128



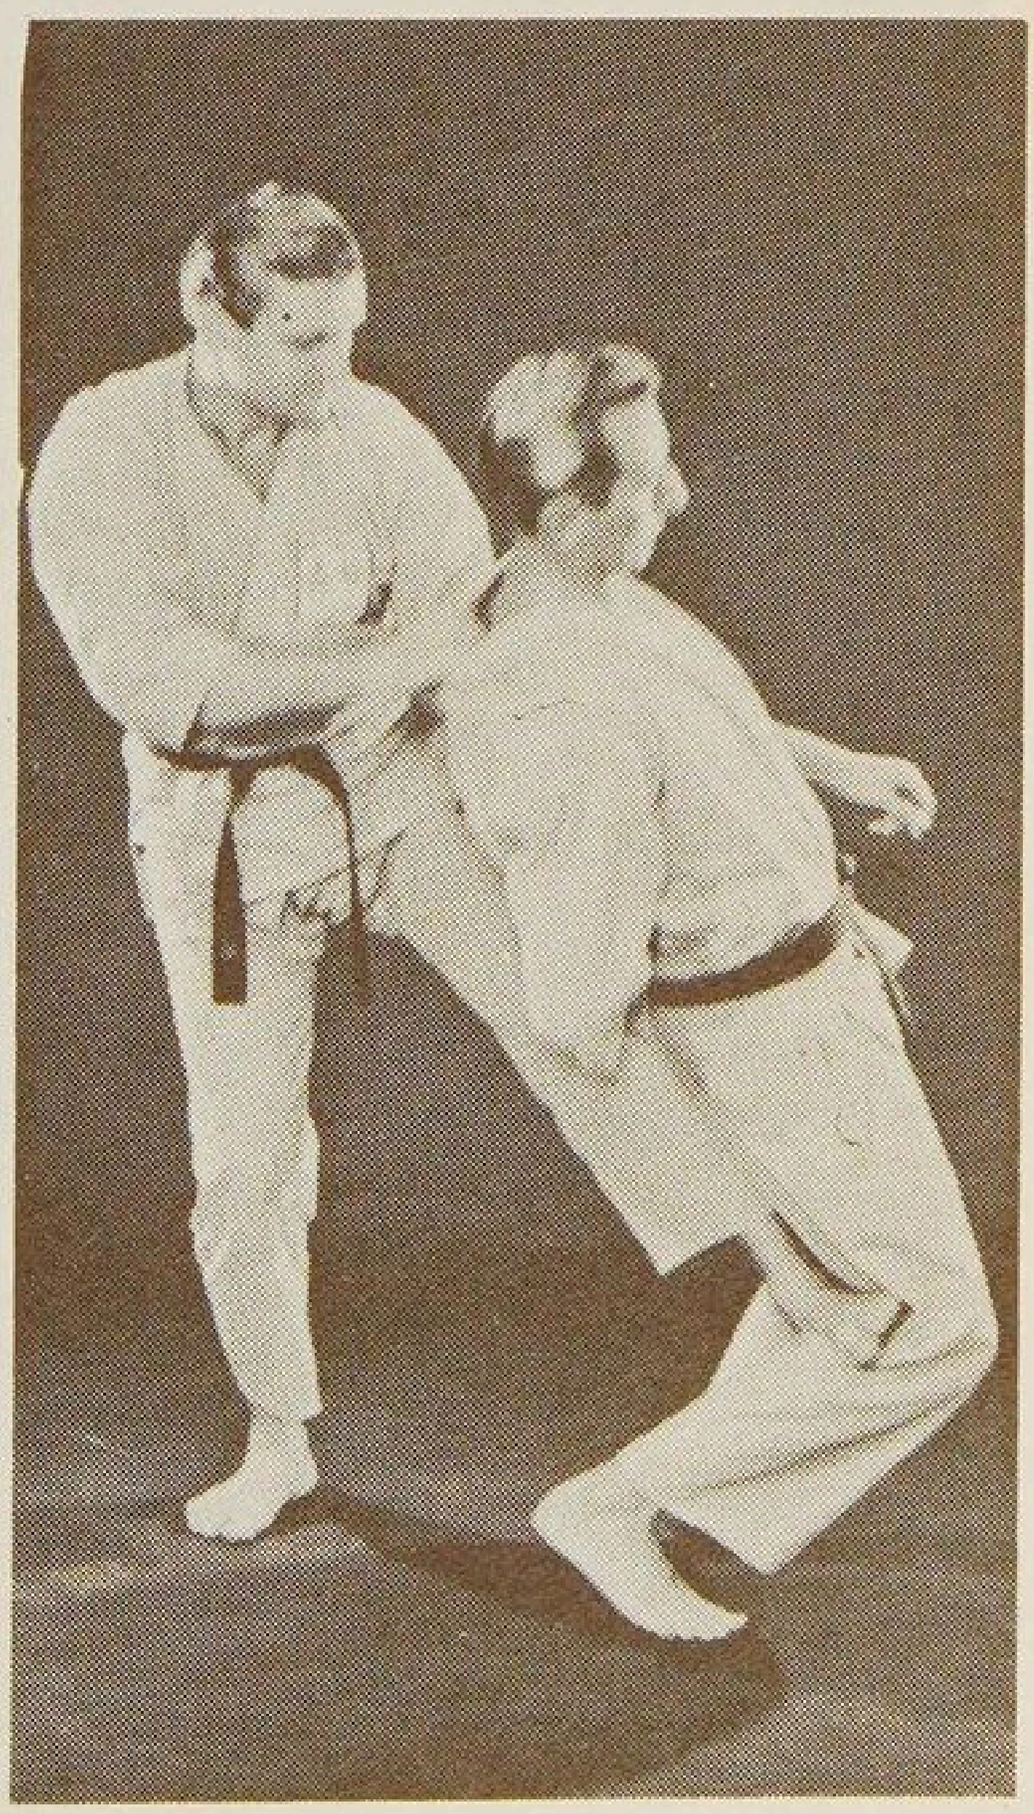
129



130



131

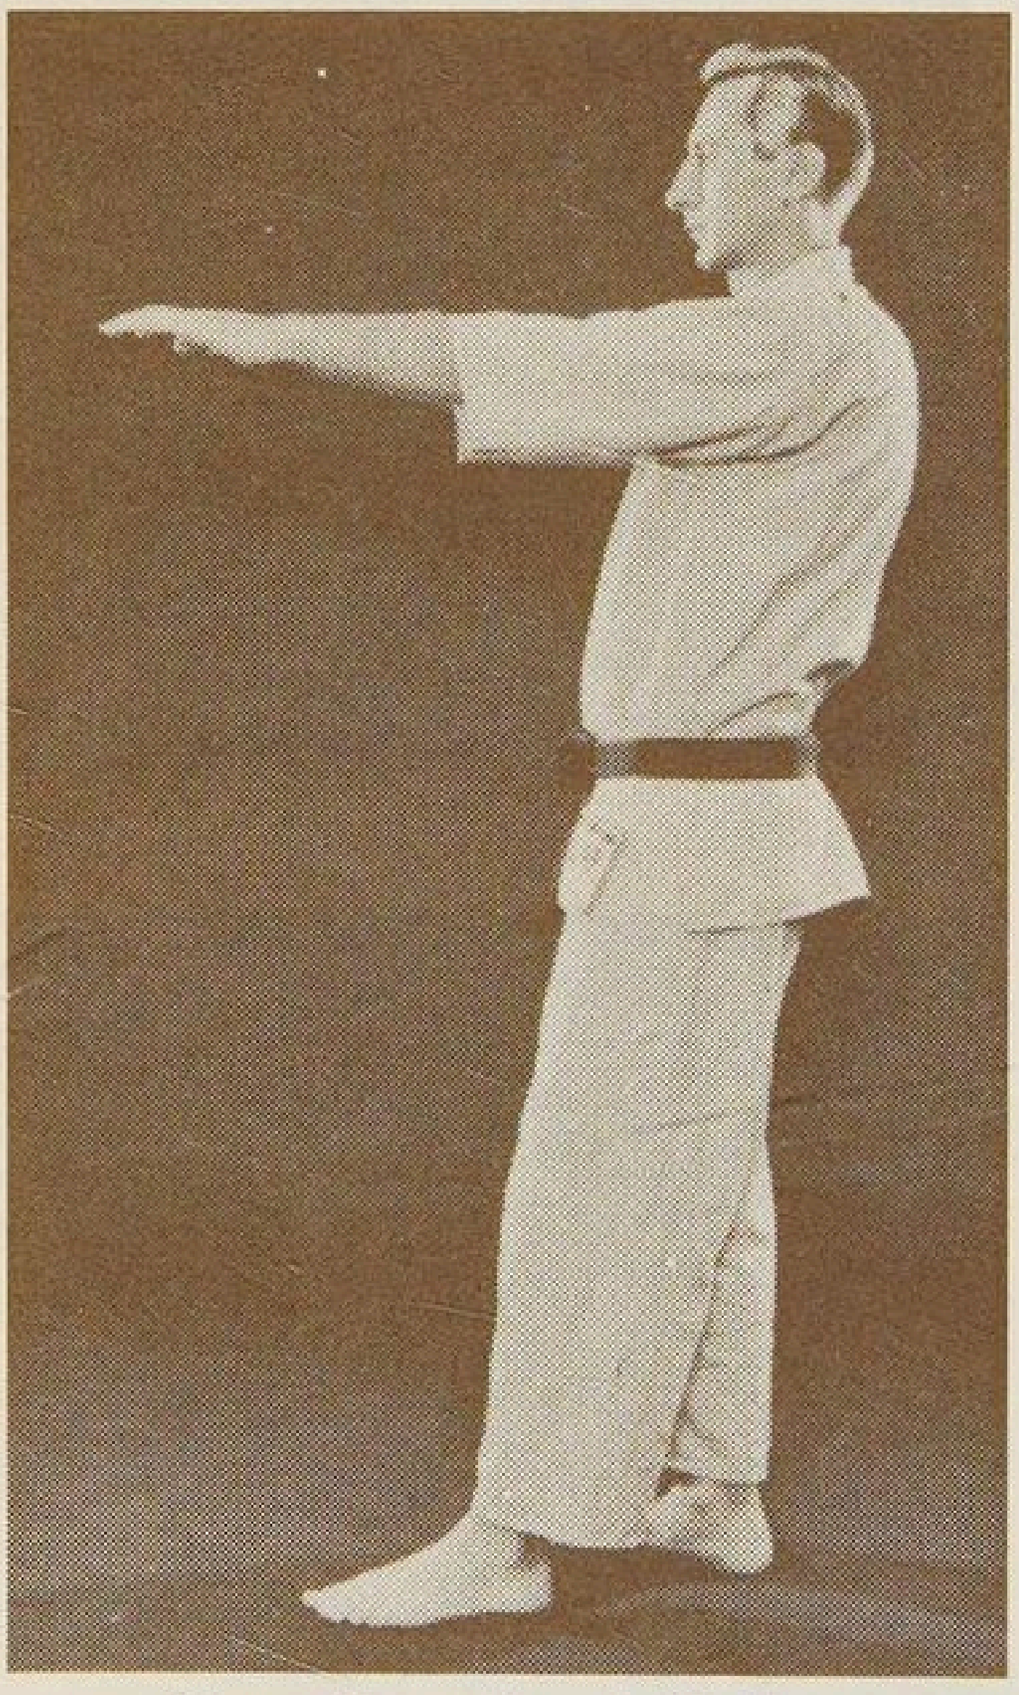


FALLS

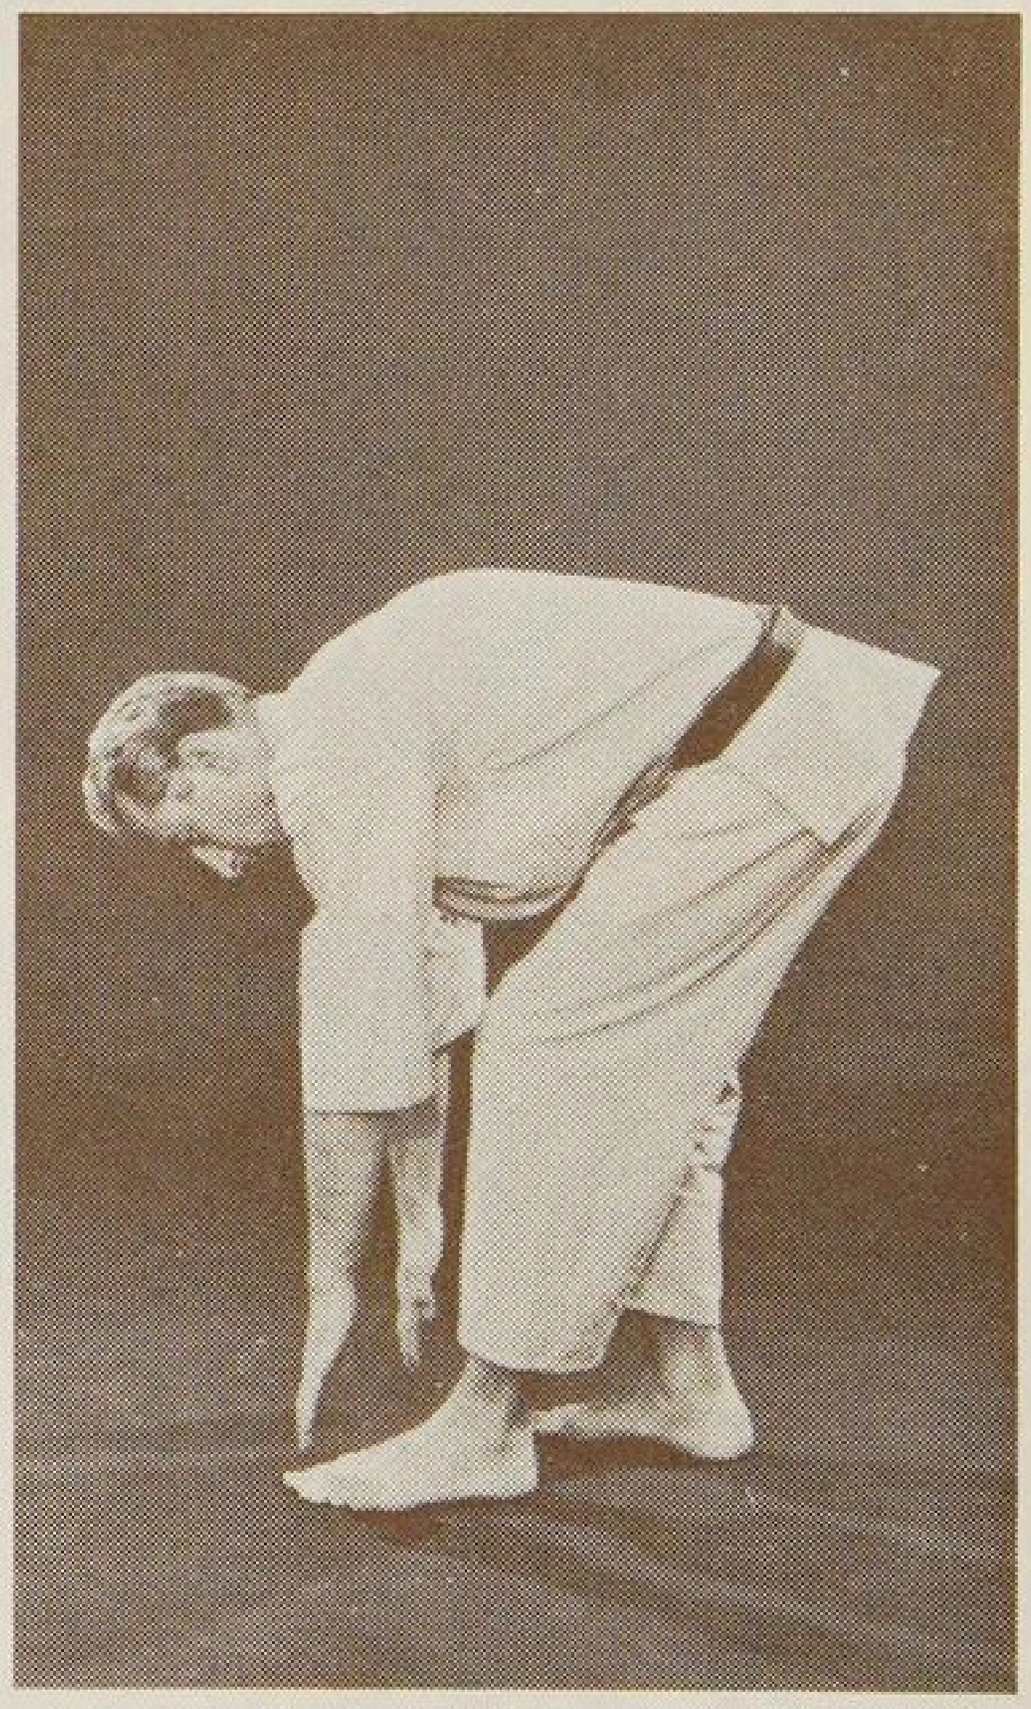
For practical self-defense only, the falls are optional. They are excellent for exercise and coordination practice and they ought to be learned for safety should you trip, slip, or be shoved onto the ground. To achieve jukado blue rank you will have to learn to take these three falls well enough to be thrown for the test demonstration. (Although receiving is not graded for the score.) You will be practicing the falls as you are learning the throws and your competence in both should increase equally.

In beginning practice, you and your partner must *ease* each other into the ground; as your falling proficiency develops, you can *gradually* increase the speed and vigor of the throw.

132



133



Standing Back Fall

132. Start from standing position, arms extended.

133. Take a step back with your right foot as you bend forward as though to touch your toes.

134. Shift your weight to your right foot, sit slowly down as close to your heel as you can before . . .

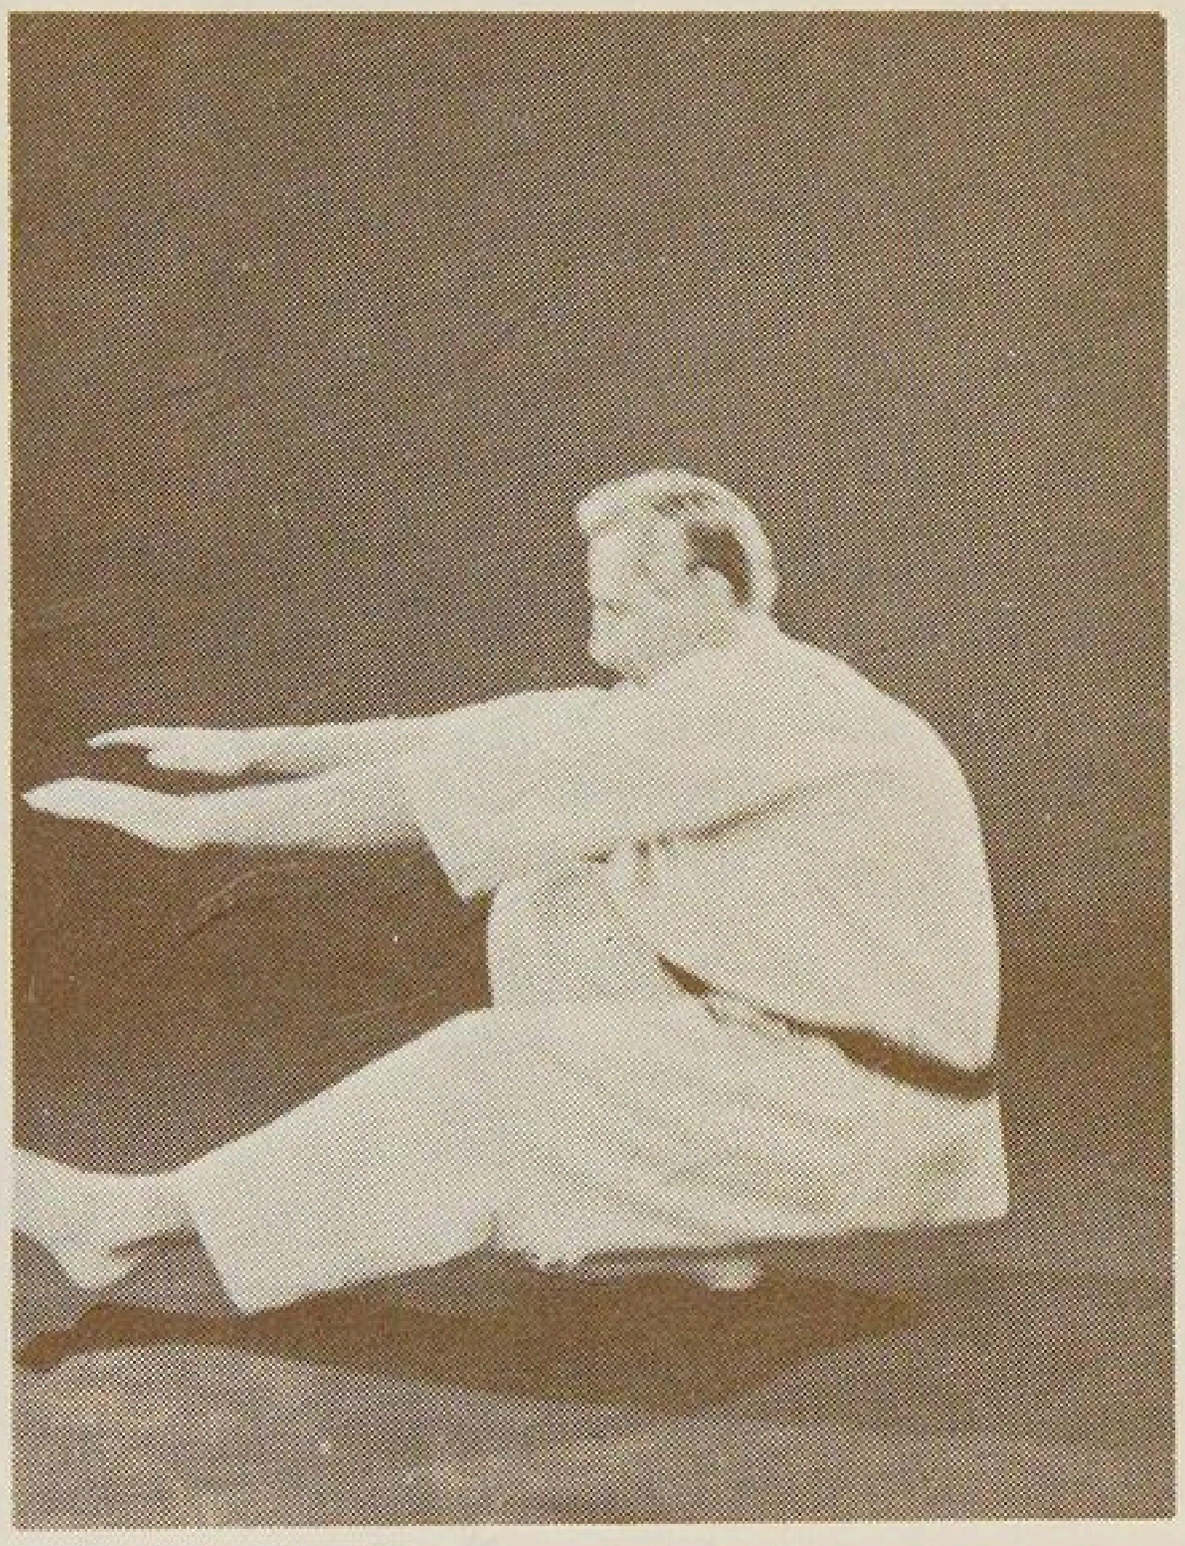
135. . . . allowing your body to roll back gently.

136. Slap the mat vigorously as your buttocks touch the mat. Finish with your legs raised, your head off the mat.

Especially in beginning practice, avoid thrusting yourself down onto the mat. Do the fall slowly and gently until the timing is

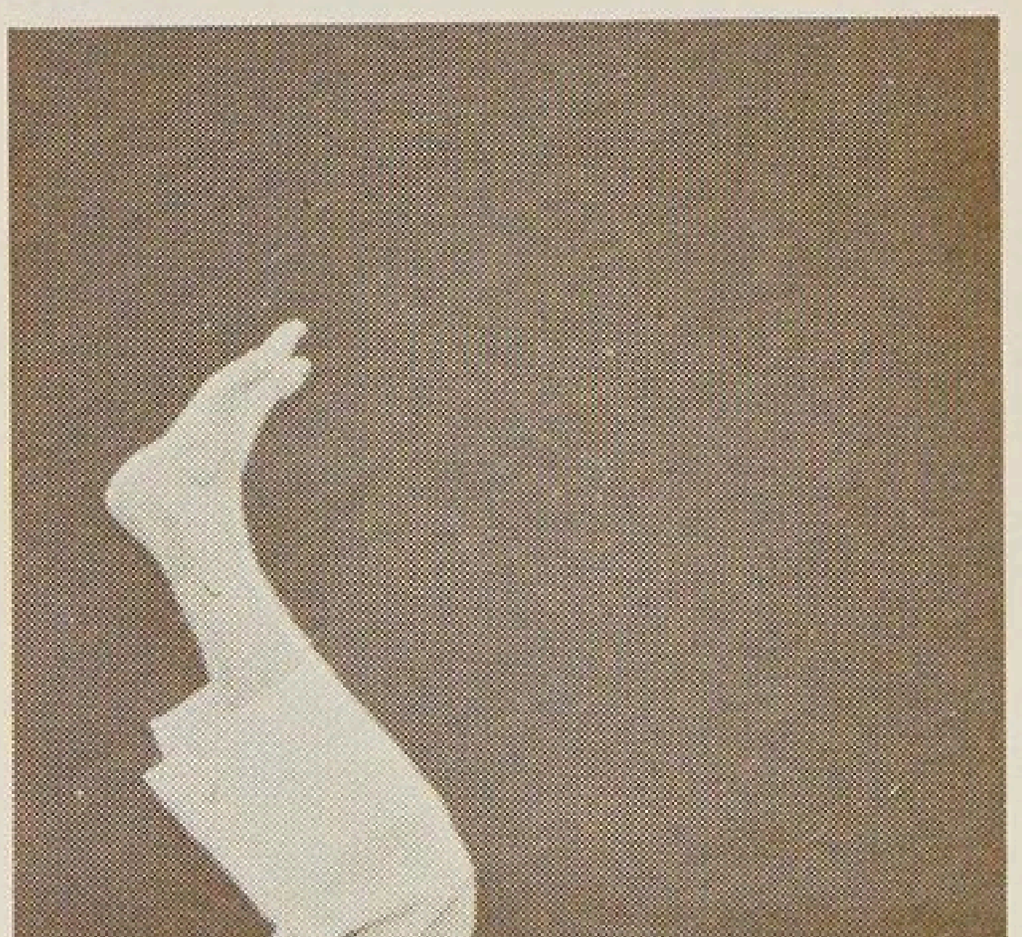
correct. Proper technique is most important; it is easy to gain speed in the fall after you have learned proper technique. Your head should never touch the mat. Slapping with your hands slightly cupped, close to your body, and with a vigorous bouncing action gives greatest absorption of impact shock.

134



135

136



Step and Pivot

This fall is appropriate for receiving the straight foot throw.

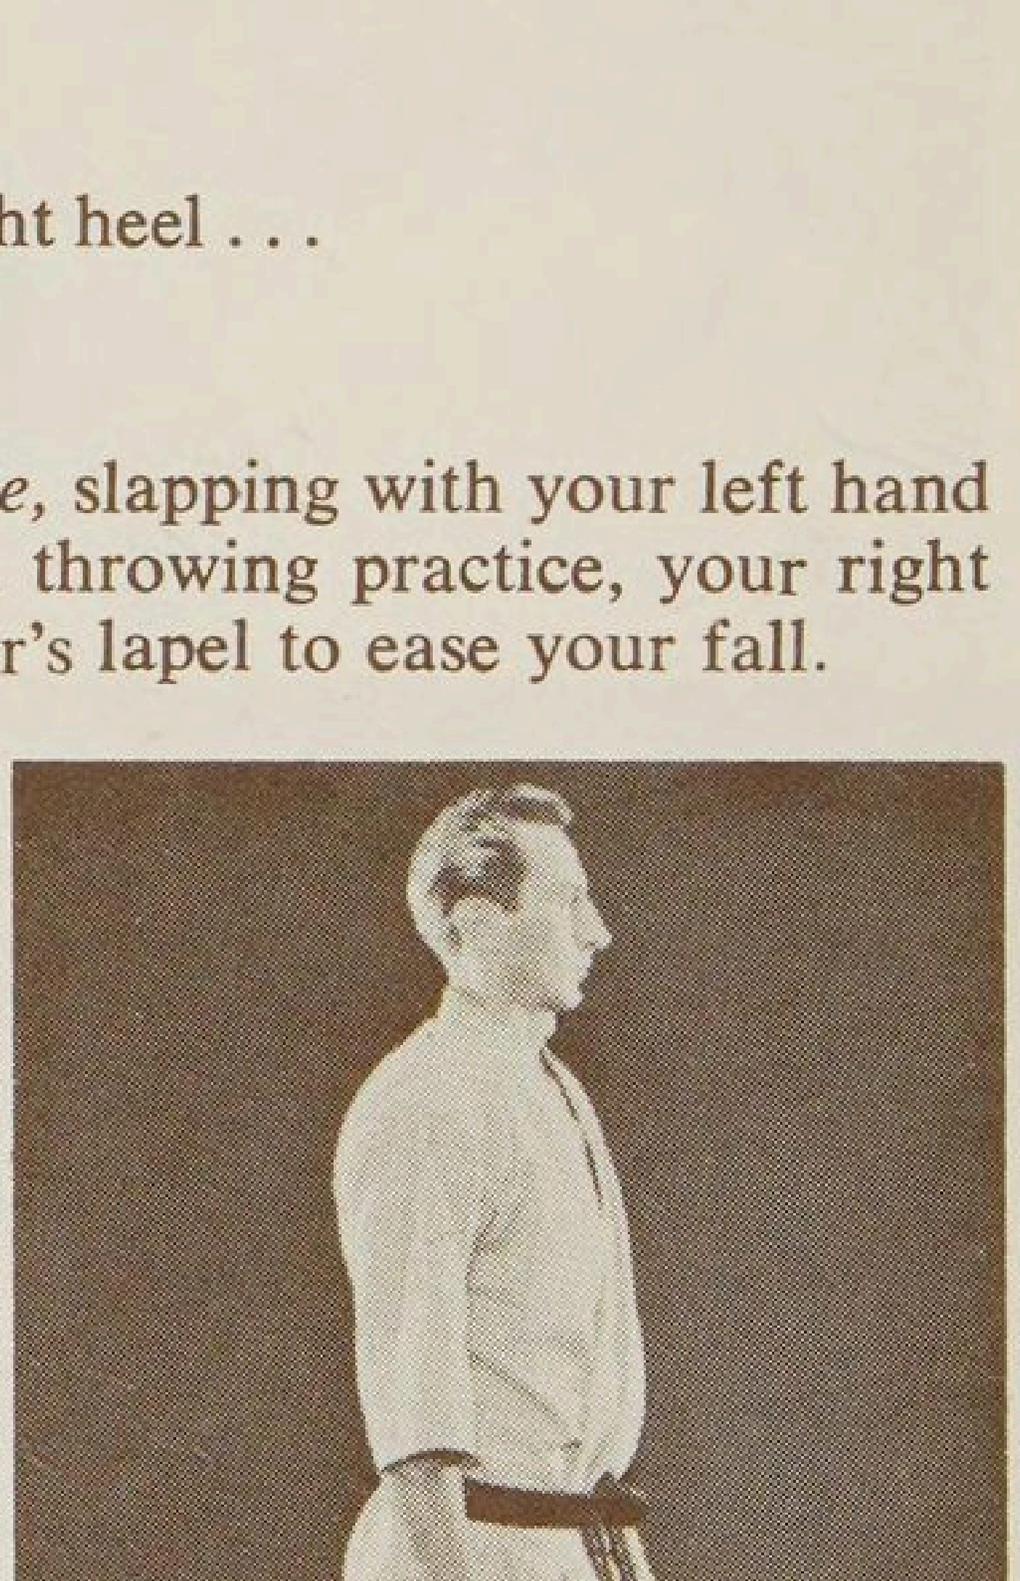
137. Start from a standing position with your left foot slightly forward.

138, 139. There is no hesitation between the actions in these two photos. Take a step forward with your right foot and, as soon as your foot touches the mat, begin to pivot on the balls of both feet counter-clockwise to face opposite direction from your starting position; shift your weight to the right foot, raise your left hand . . .

140. . . . sit down close to your right heel . . .

141. . . . roll back *on your left side,* slapping with your left hand as your buttocks touch the mat. In throwing practice, your right hand would still be holding thrower's lapel to ease your fall.

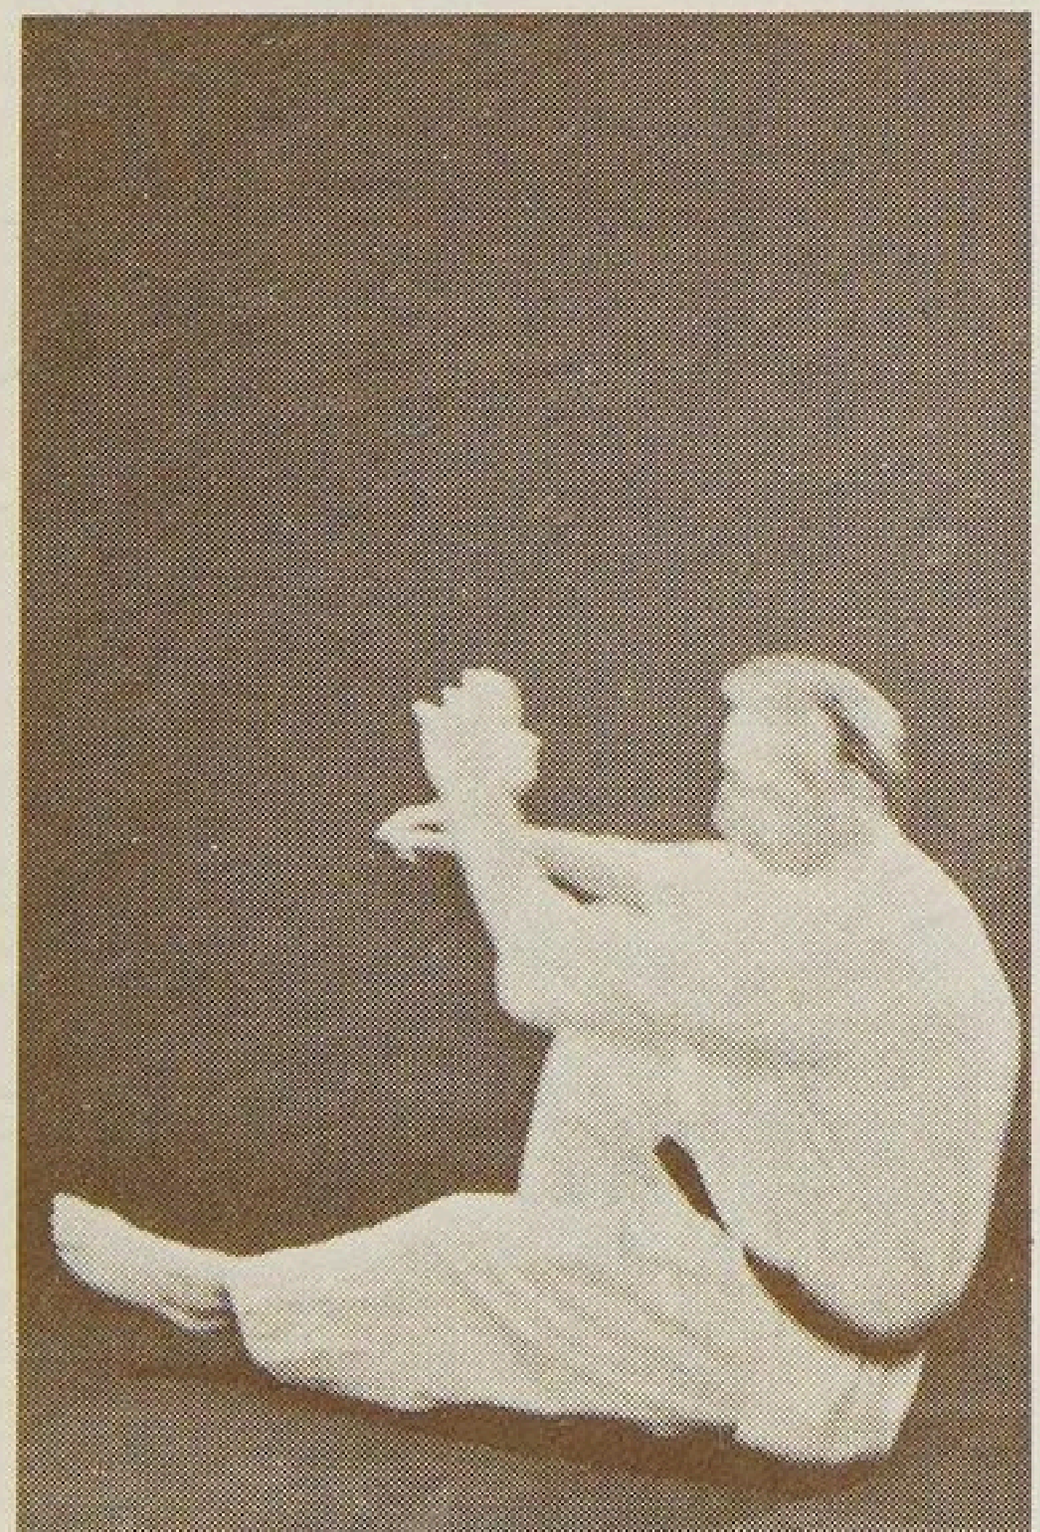
137



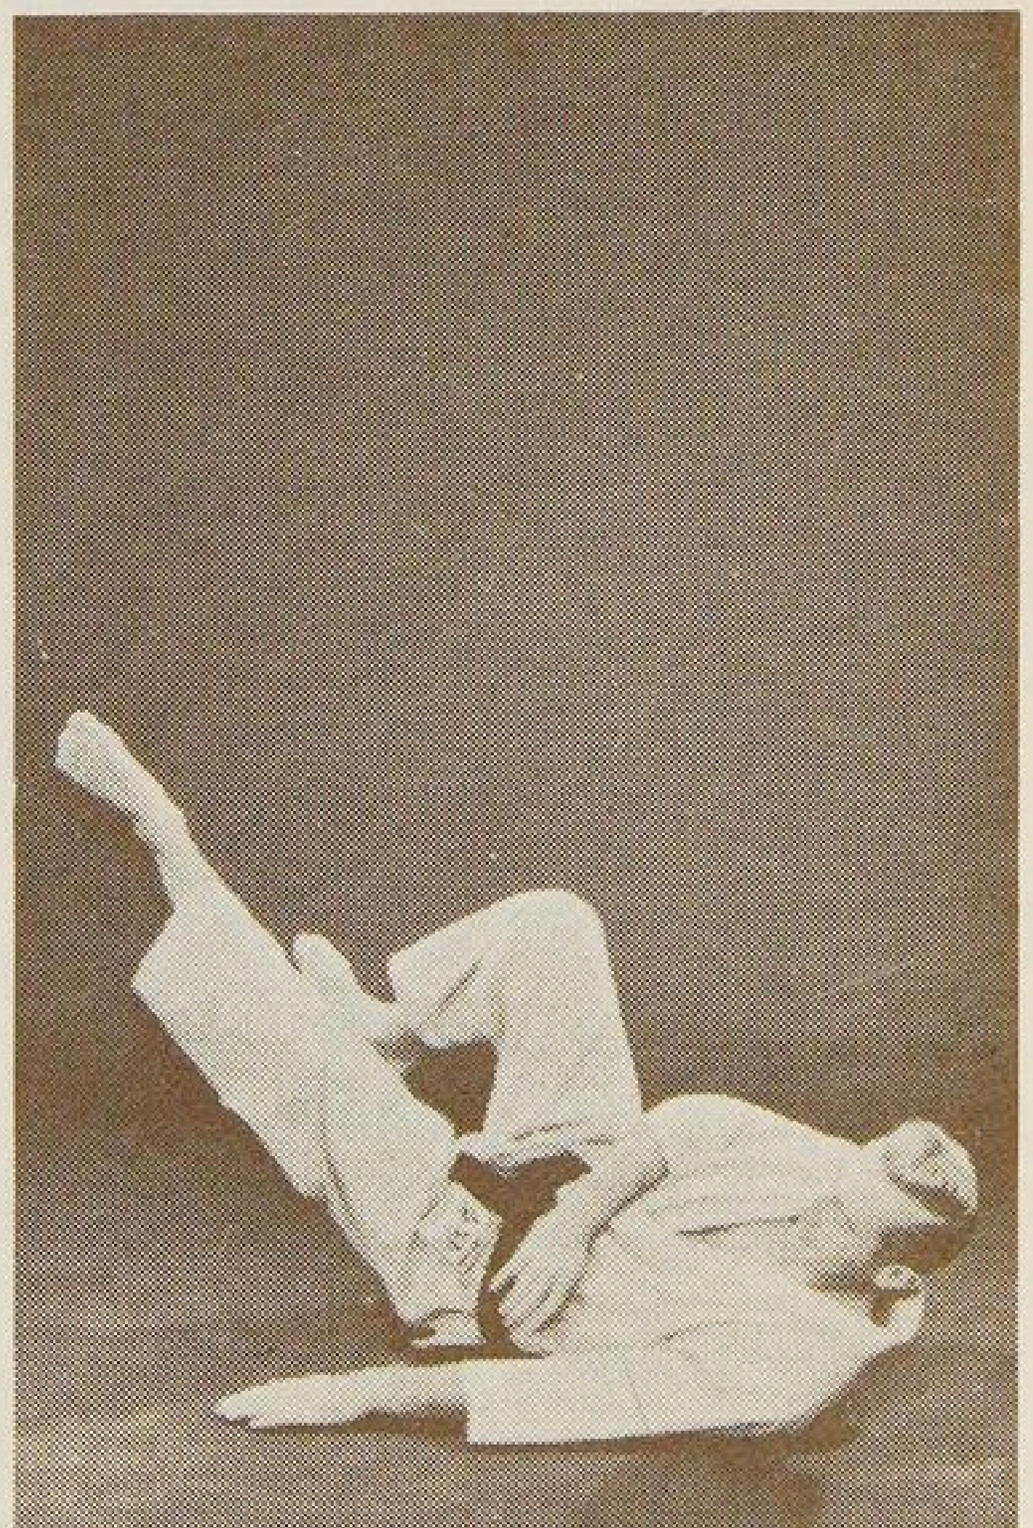
138

139

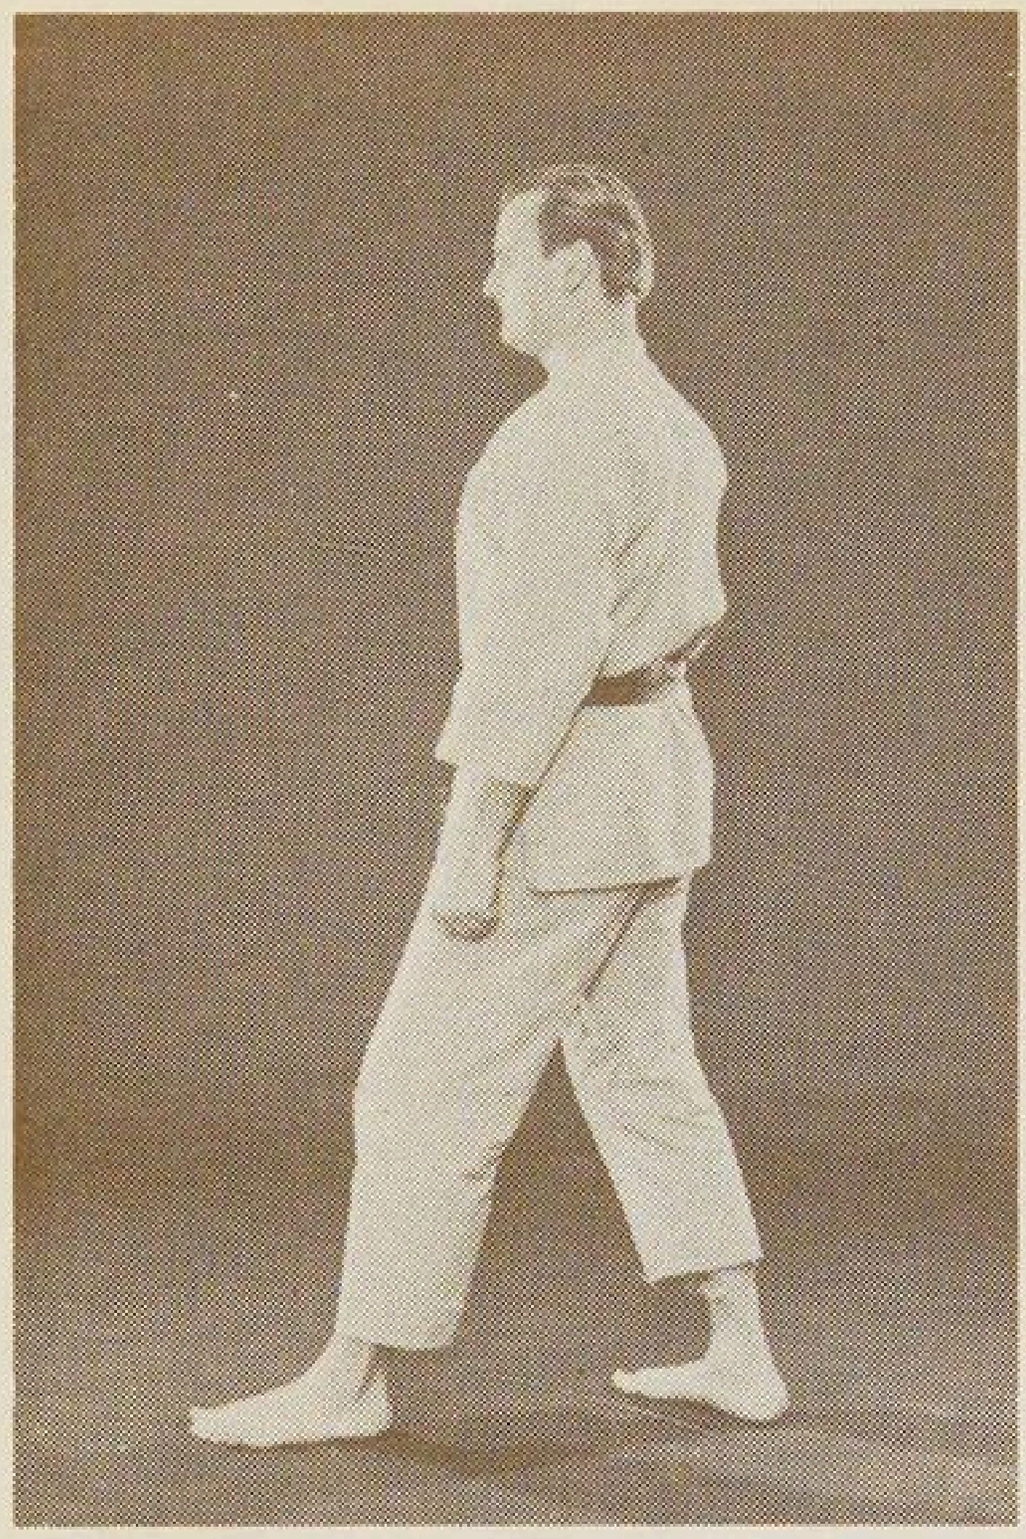
140



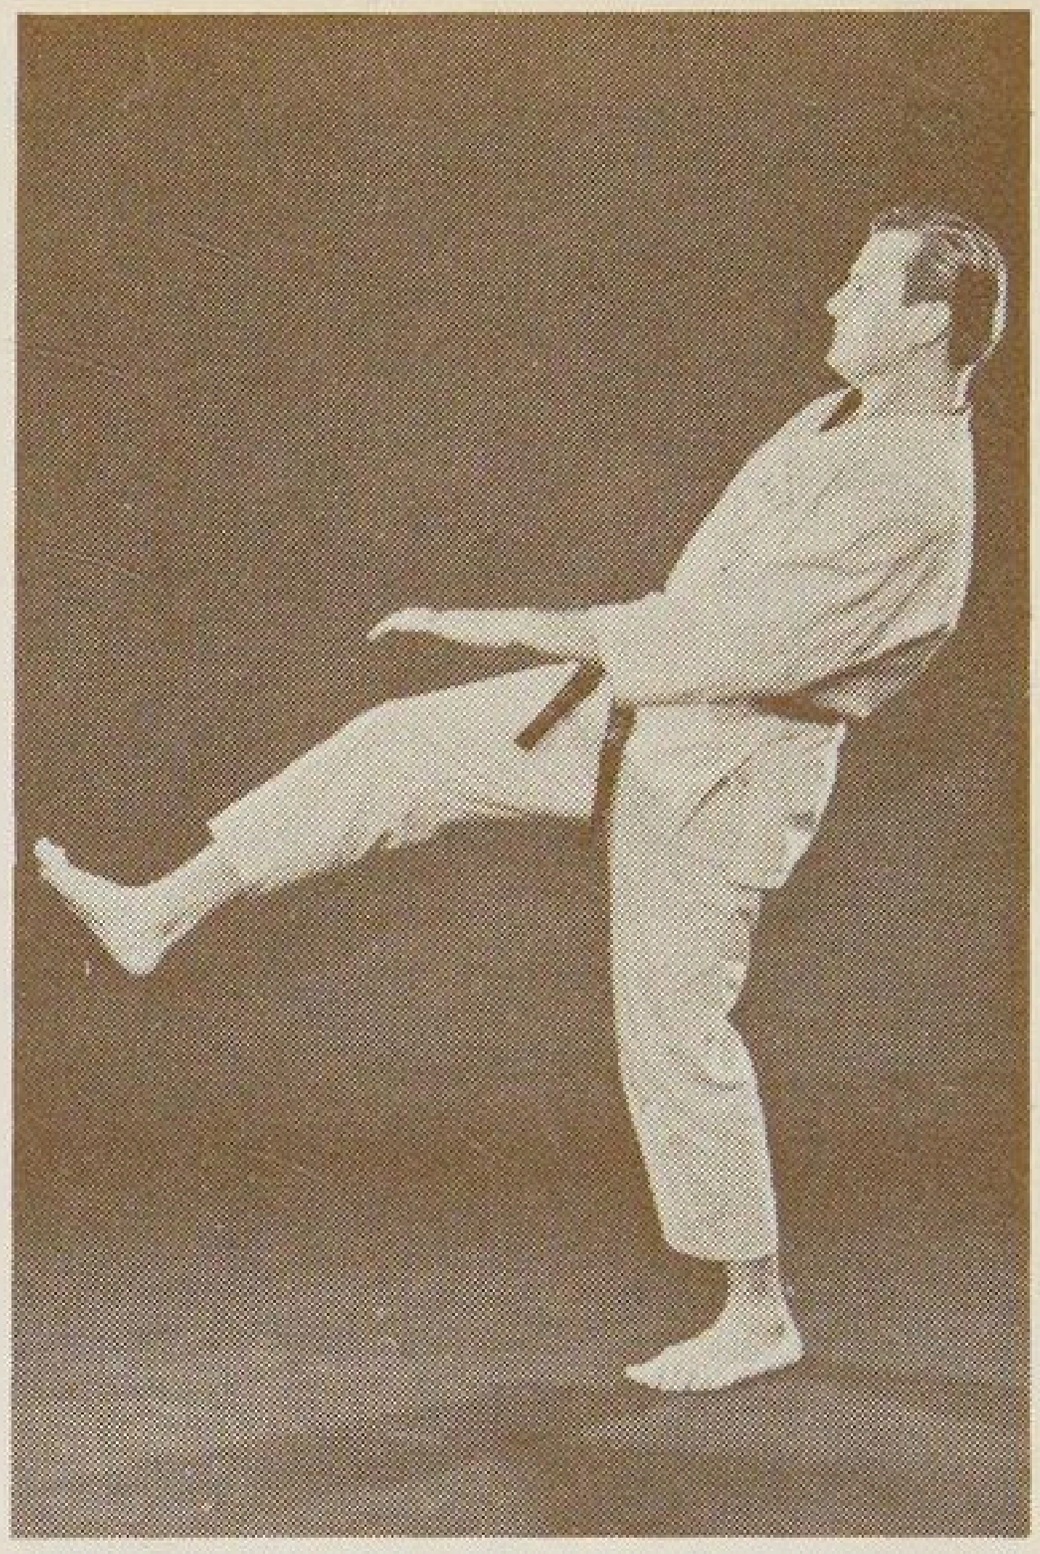
141



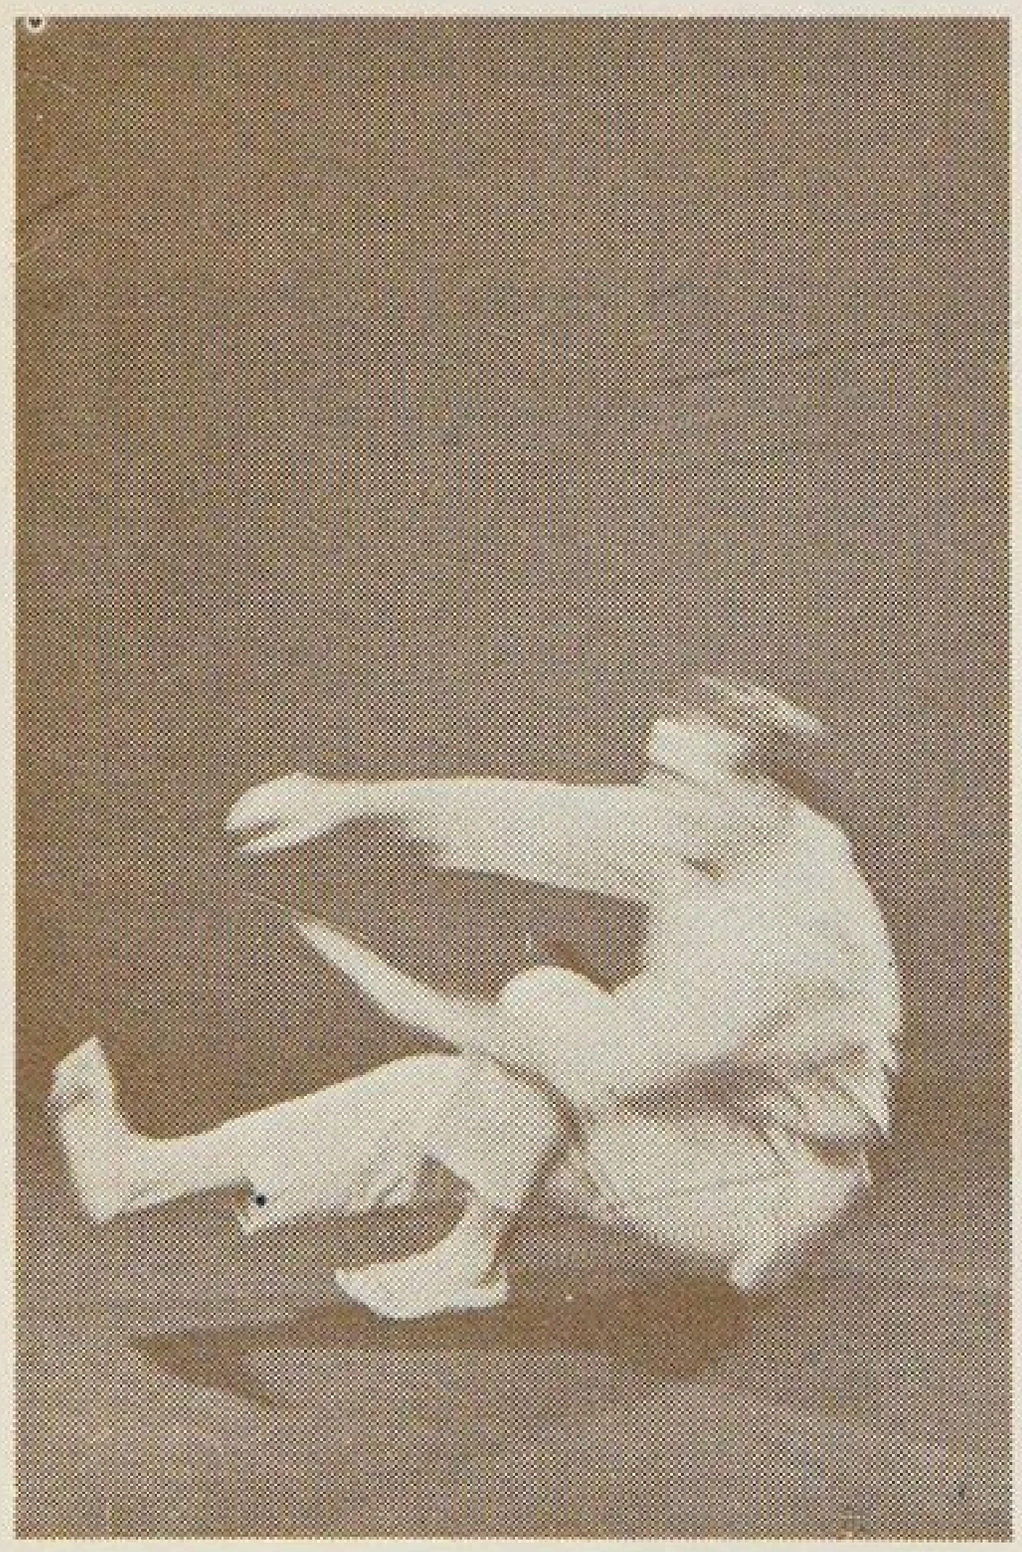
142



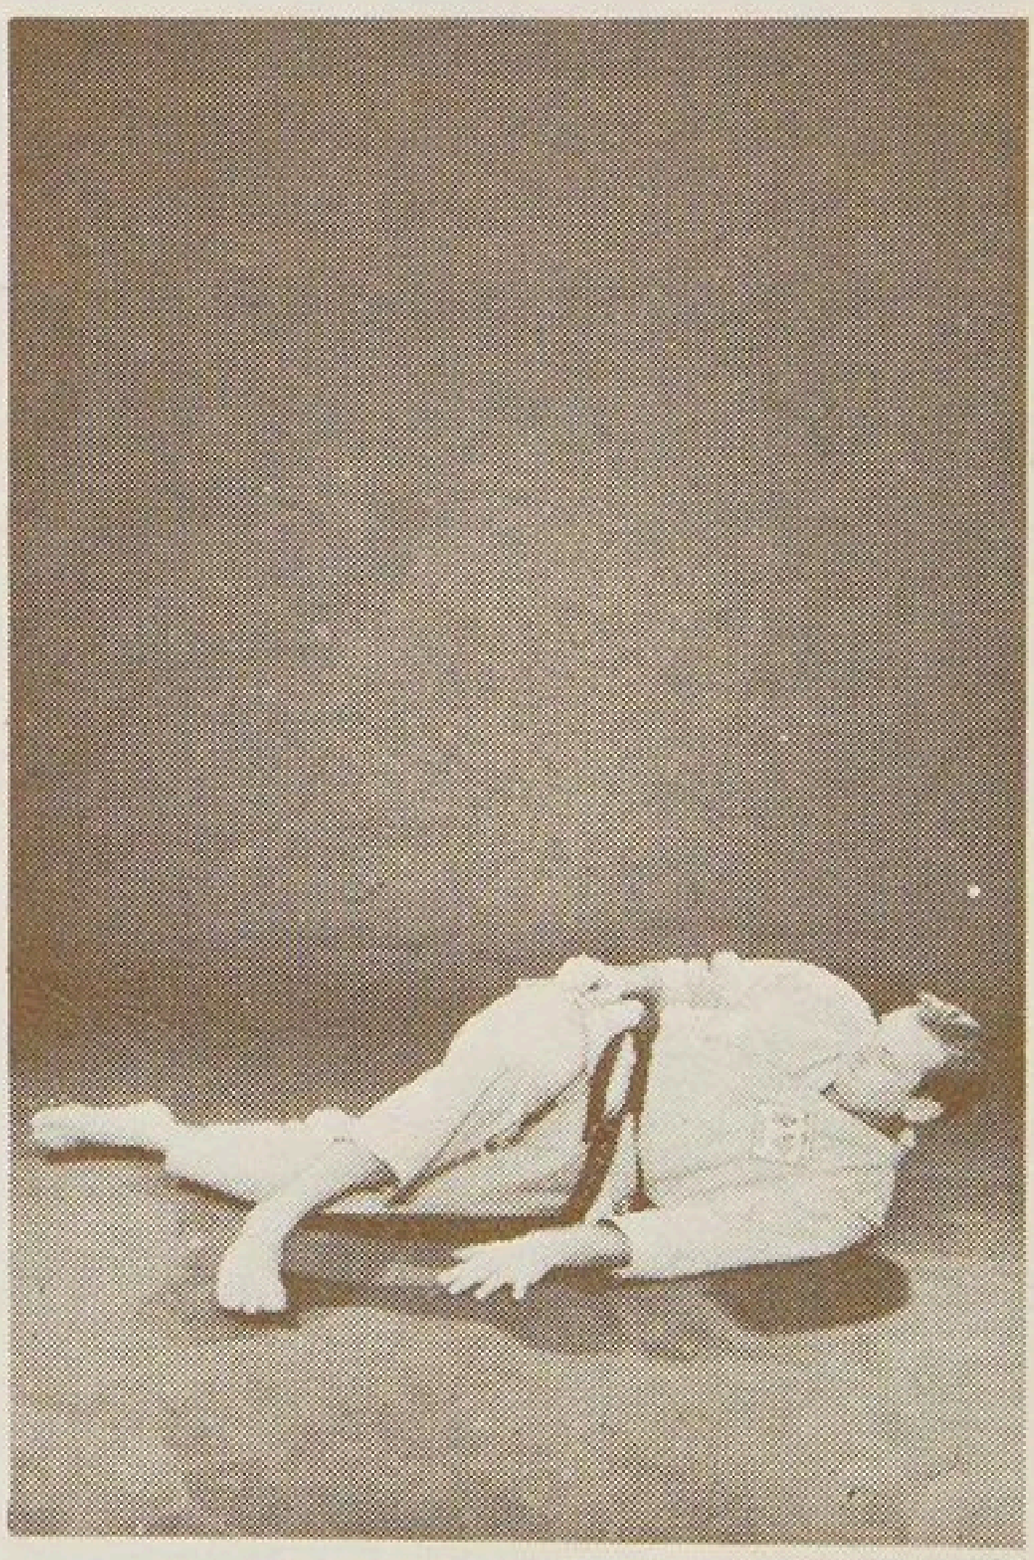
143



144



145



Step and Sit Fall

This is the appropriate fall for receiving kick back throw.

142. Start from standing position with left foot well forward.

143. Take a step with your right foot and without hesitation raise it . . .

144. . . . and sit down close to your left heel, swinging your left arm up . . .

145. . . . roll onto your left side as you slap with your left hand and foot.

When you first use this fall in actual throwing practice, your right hand would still be holding onto your partner's lapel to ease your fall.

THROWING AND BEING THROWN (Receiving)

In order to let you see the essential actions of the throws, they are taught *as though* there were little hesitations between the several movements involved in each one. When you first start to follow the instructions for throwing, you should go through them step by step, including the hesitations. This will help you understand the mechanics of the throw and help you do it in a technically correct manner. When you understand how the throw is applied then you begin to blend the steps of the actions until there are no hesitations; the process from start to finish is one smooth, flowing operation.

Some of the throws are much more difficult to do in "stop action," depending on the impetus of the moving body to make them work. However, if you can do the throws properly in the slow motion and stop action manner, you will have a solid basis of good technique upon which it is relatively easy to build speed.

Being Thrown (Receiving)

The term which is commonly used for being thrown is "receiving." When you receive a throw, or are the receiver, it means you are the person being thrown. It is the assumption in this book that both partners are interested in learning the throws and that both must, therefore, learn to fall correctly in order to take turns throwing. Let me emphasize once more that for practical techniques of self-defense, it is not necessary to learn to be thrown.

For those who are expecting to progress to the advanced ranks of jukado, receiving is necessary. From the very beginning, such students must correct their receiving form as well as throwing form. Each time you receive from a throw, stay on the mat in the ending position and check and correct yourself.

PRE-THROWING ACTION

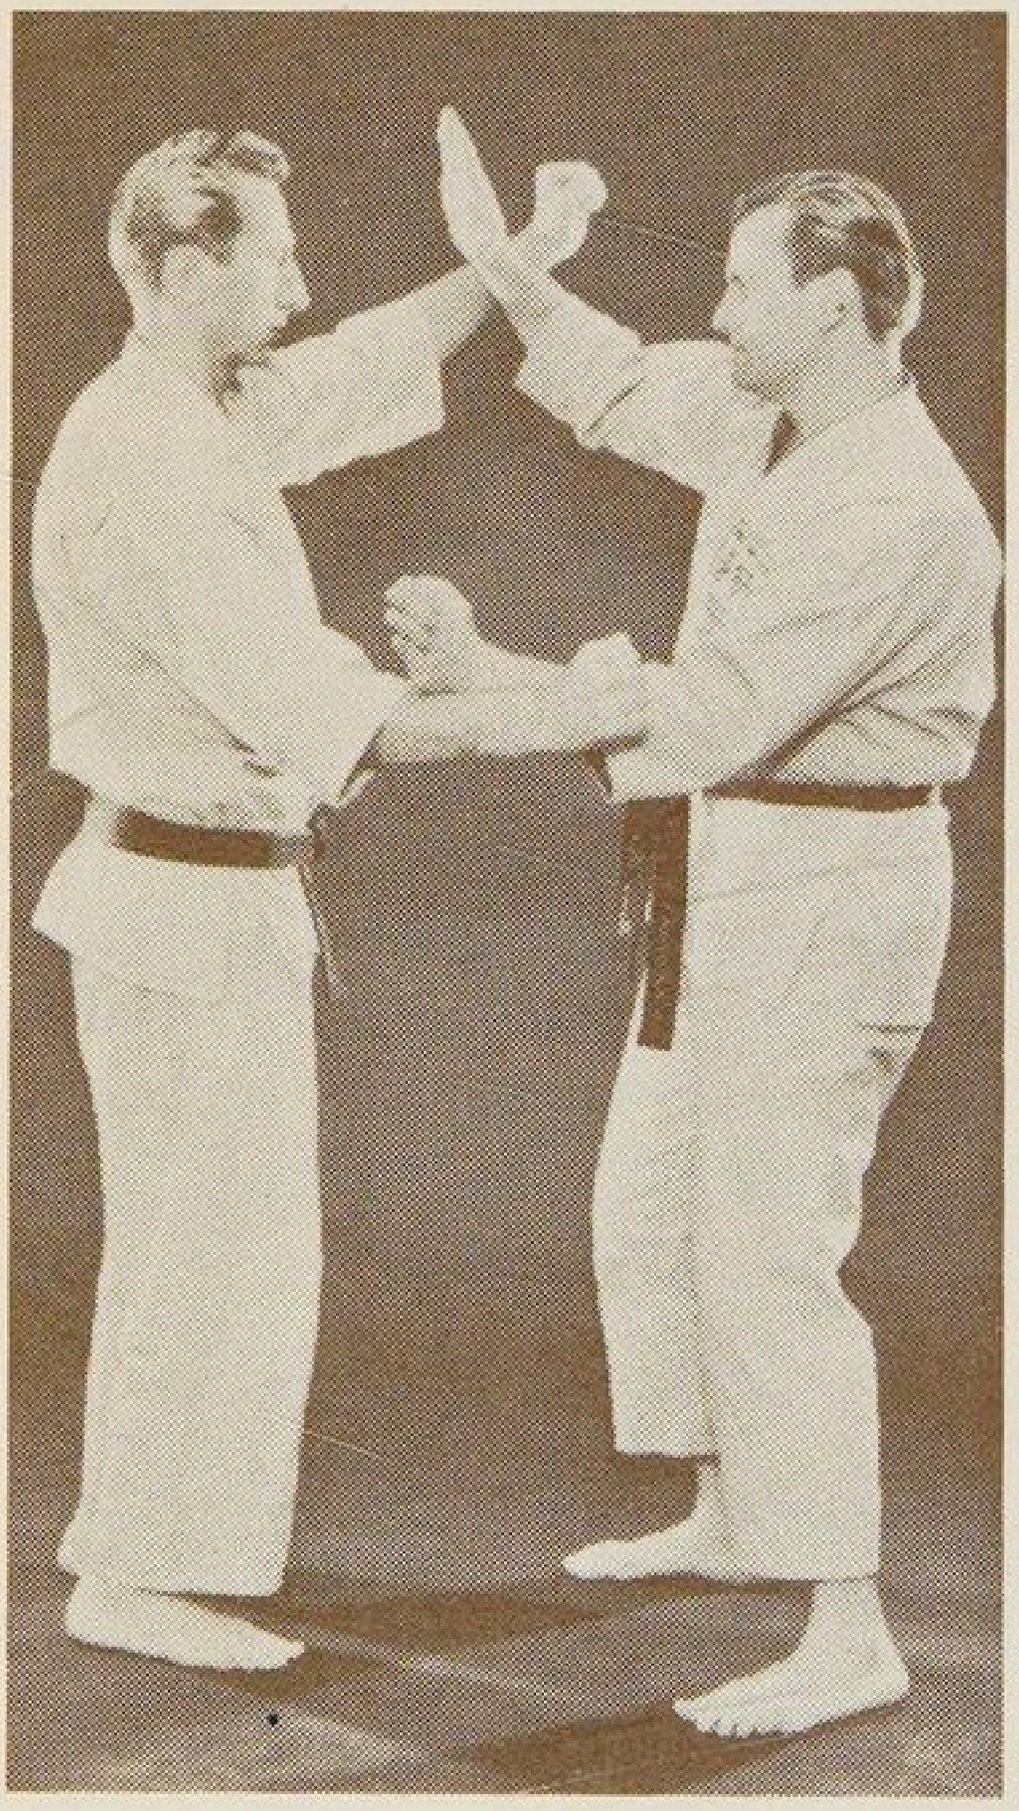
None of the throwing techniques is suitable for practical self-defense unless preceded by action which stops the intended attack and which weakens the adversary, confusing and hurting him enough so that he is vulnerable for your throw.

In the test, all throws must be shown with the pre-throwing action. Even when you are first learning the throws, include the pre-throwing action enough times to establish the pattern.

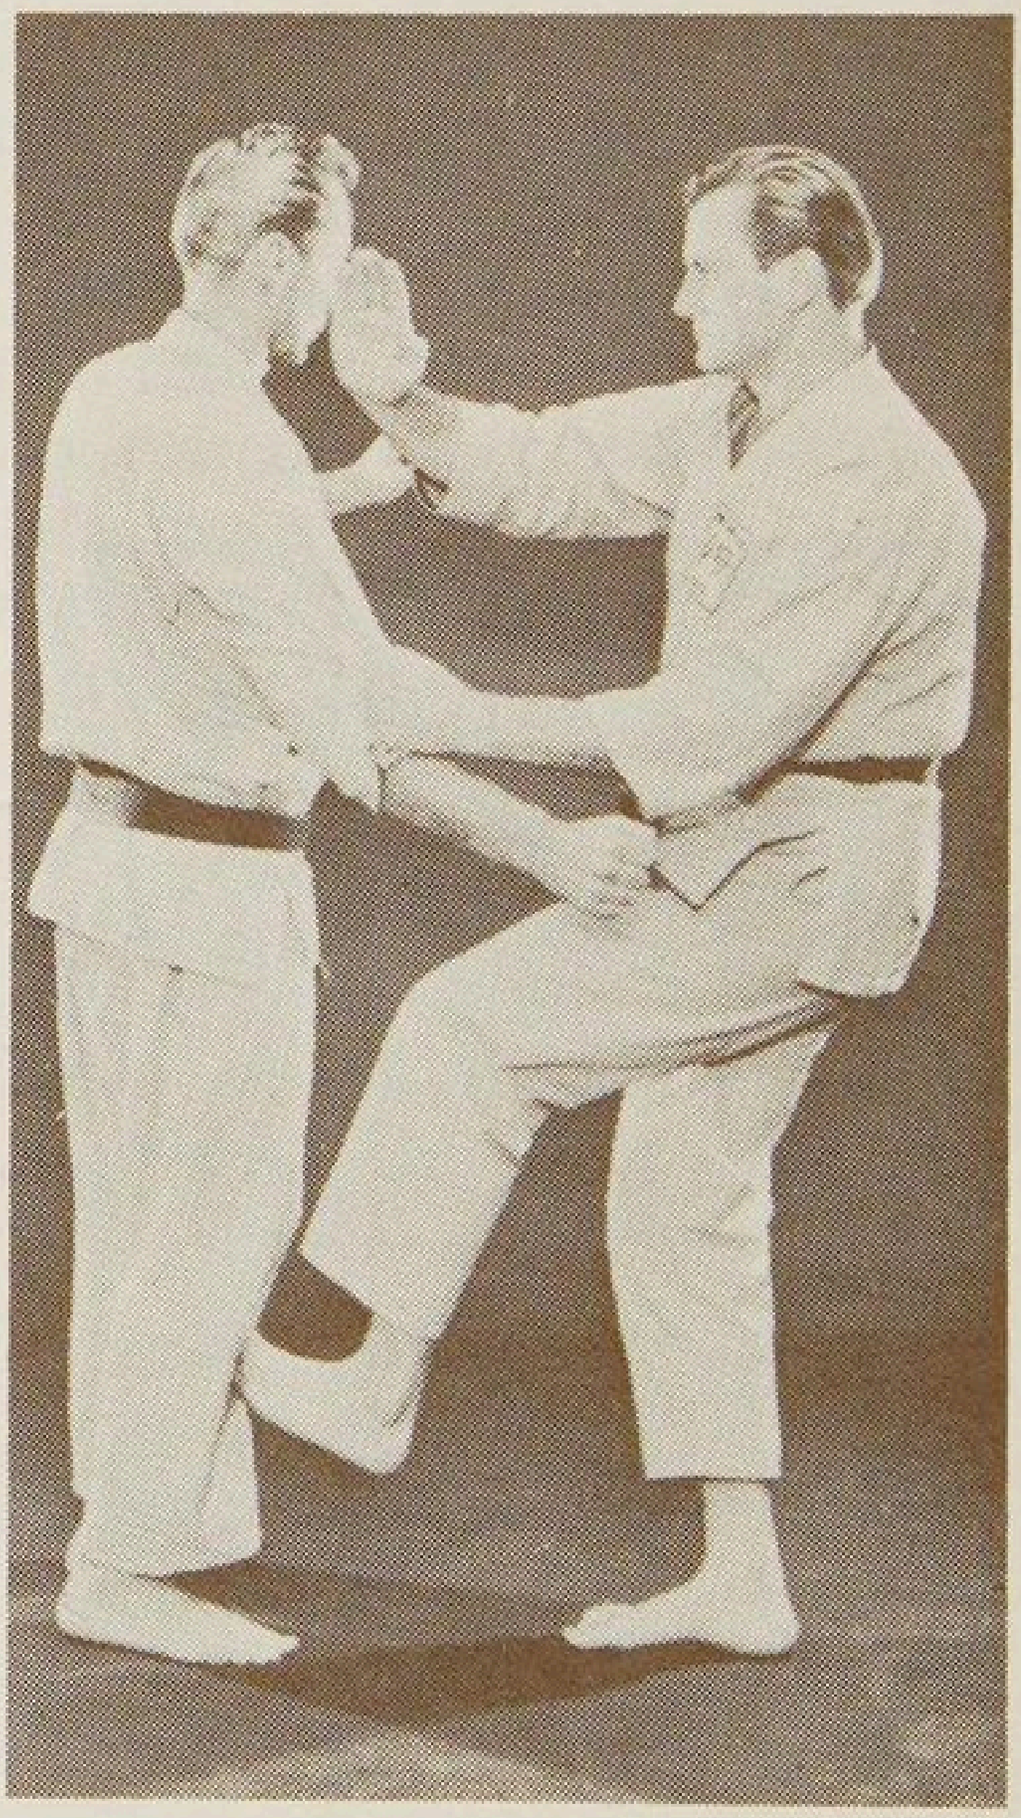
146. Simulate slashing both arms of the attacking partner, left.

147. Kick and hit several times, high and low blows.

146



147



THROWS

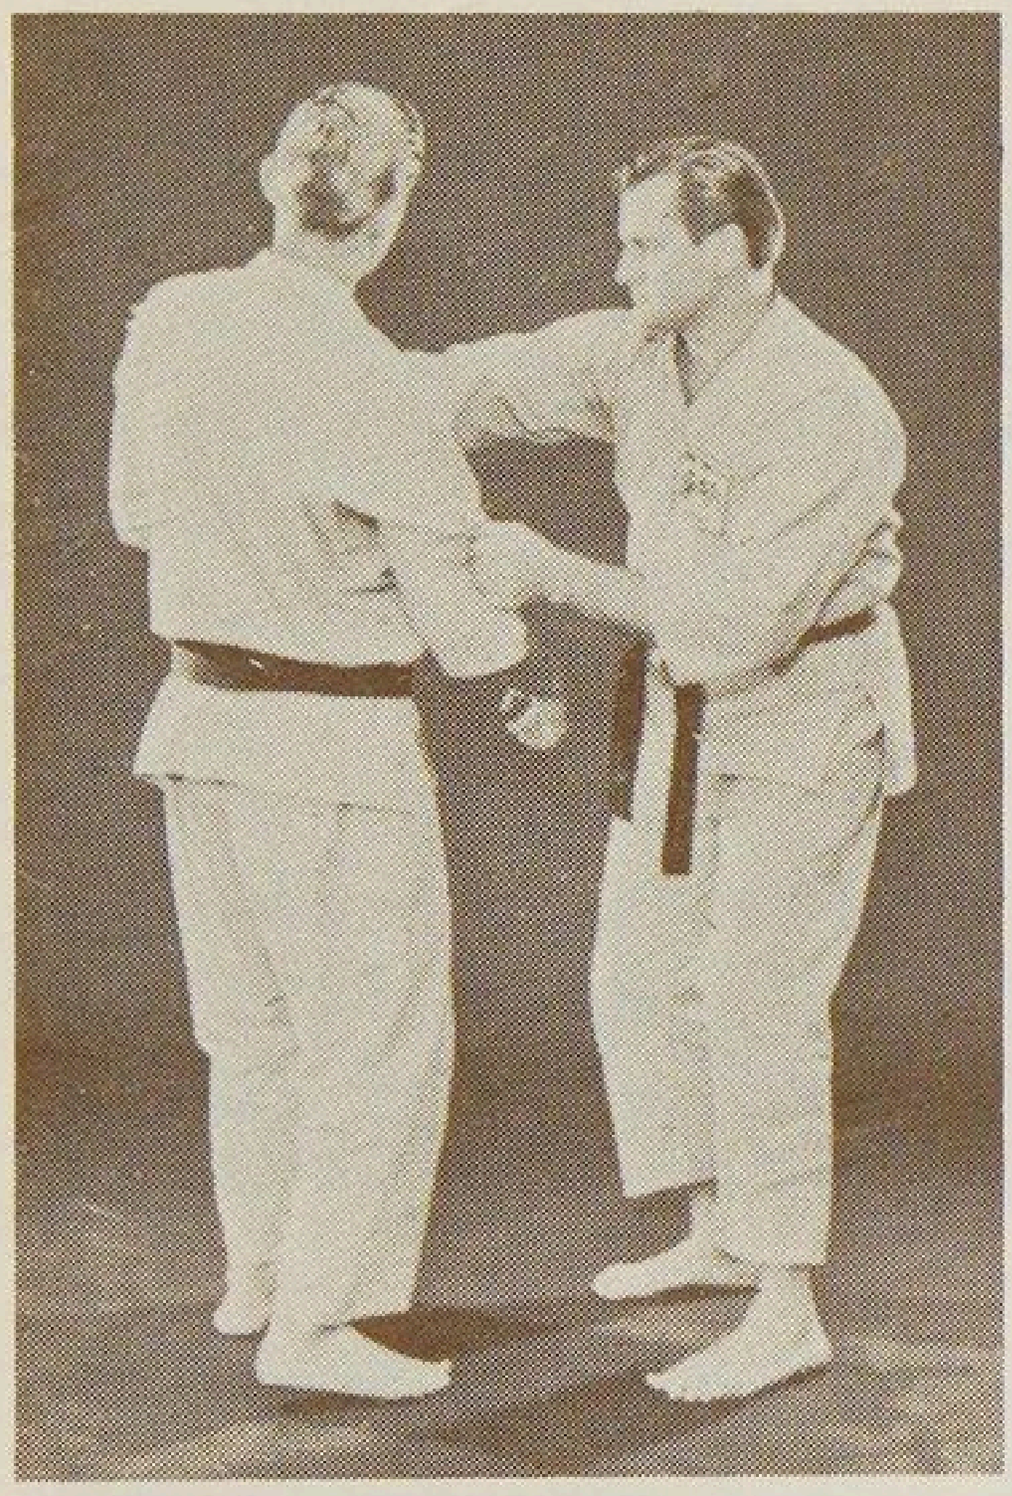
Back Takedown

148. After pre-throwing action, grip his shoulders or arms with both your hands and spin him around.

149, 150. With your right hand grip his collar as you simulate kicking into the back of his knee and pull him backward . . .

151. . . . easing him onto the ground. Note that the receiving partner must fall onto his side in beginning practice, because you have maintained your grip on his sleeve and collar. When you have advanced enough so that you can safely pull him back sharply and then release your grip, he can fall straight back, slapping with both hands.

148



149

150

151

Straight Foot Throw

152. After pre-throwing action, grip receiving partner, left, in standard fashion as you point your left foot as shown and shift your weight onto it.

153. Place your right foot outside his right foot, ankle-to-ankle; your left leg slightly bent and your right foot firm and straight.

154. With his foot locked by your ankle, pull him into your chest, off-balance, and then around and down in front of you . . .

155. . . . lowering him onto the mat and maintaining your grip with both hands to ease his fall.

Kick Back Throw

156. After pre-throwing action, grip receiving partner in standard fashion and push him off-balance as you take a deep step with your left foot, as shown.

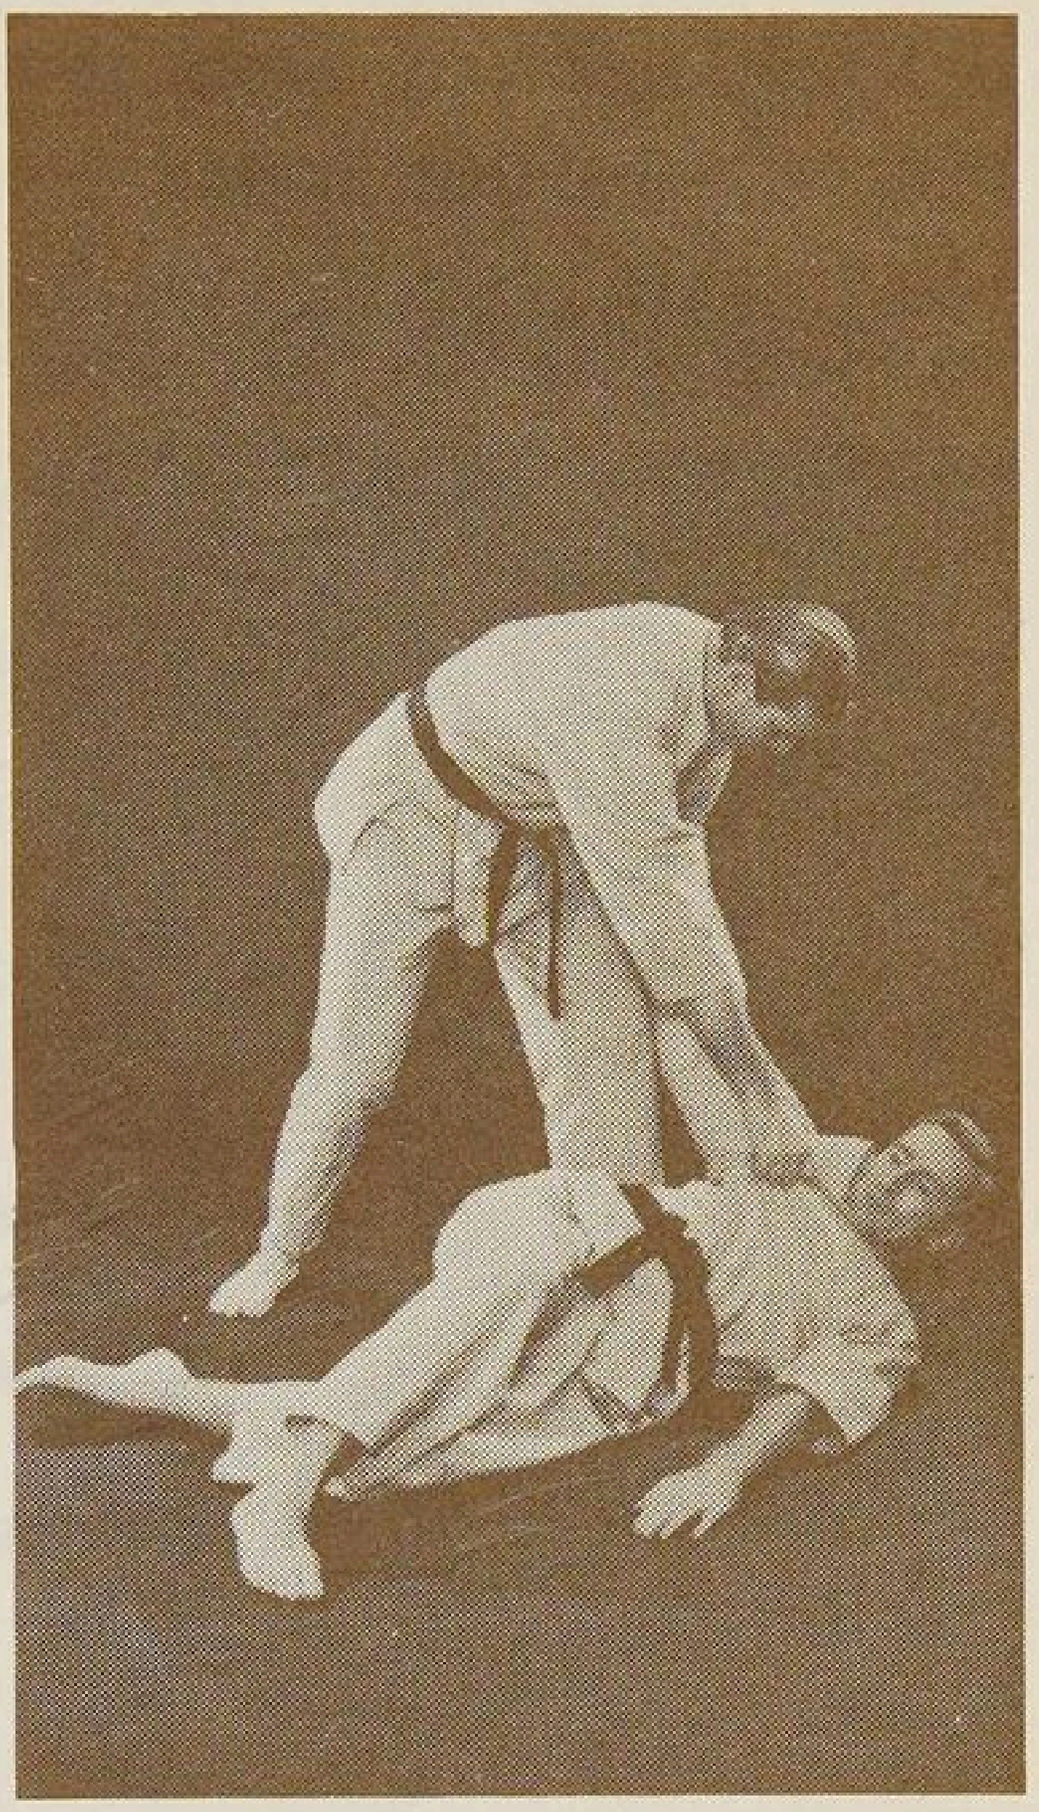
157. Swing your right leg forward and without placing it on the mat . . .

152

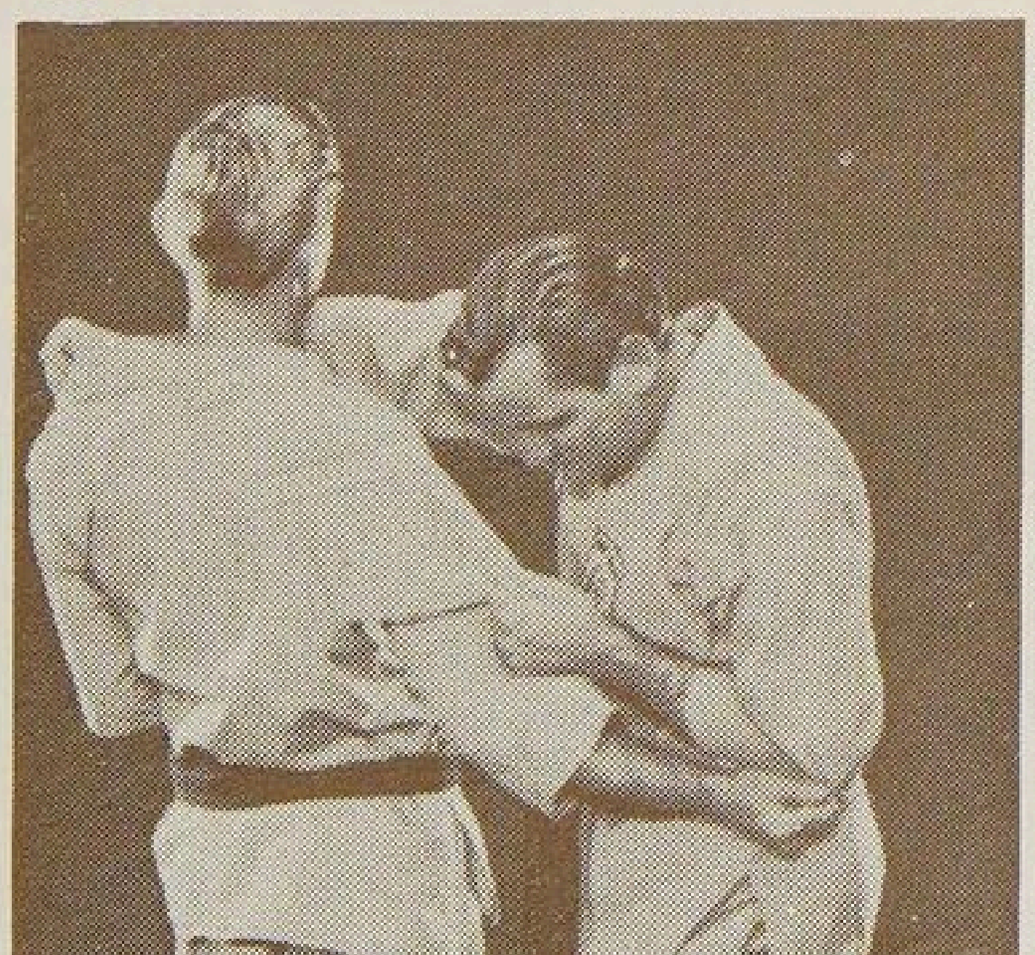
153

154

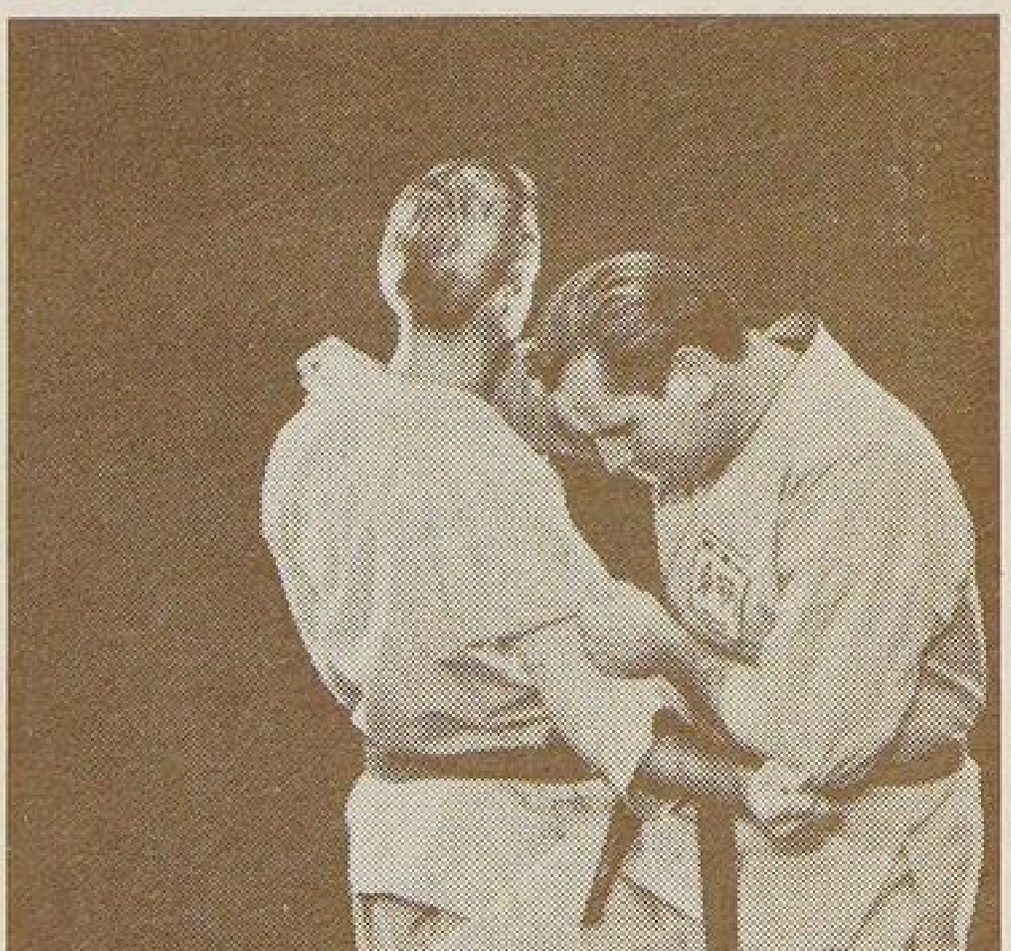
155



156



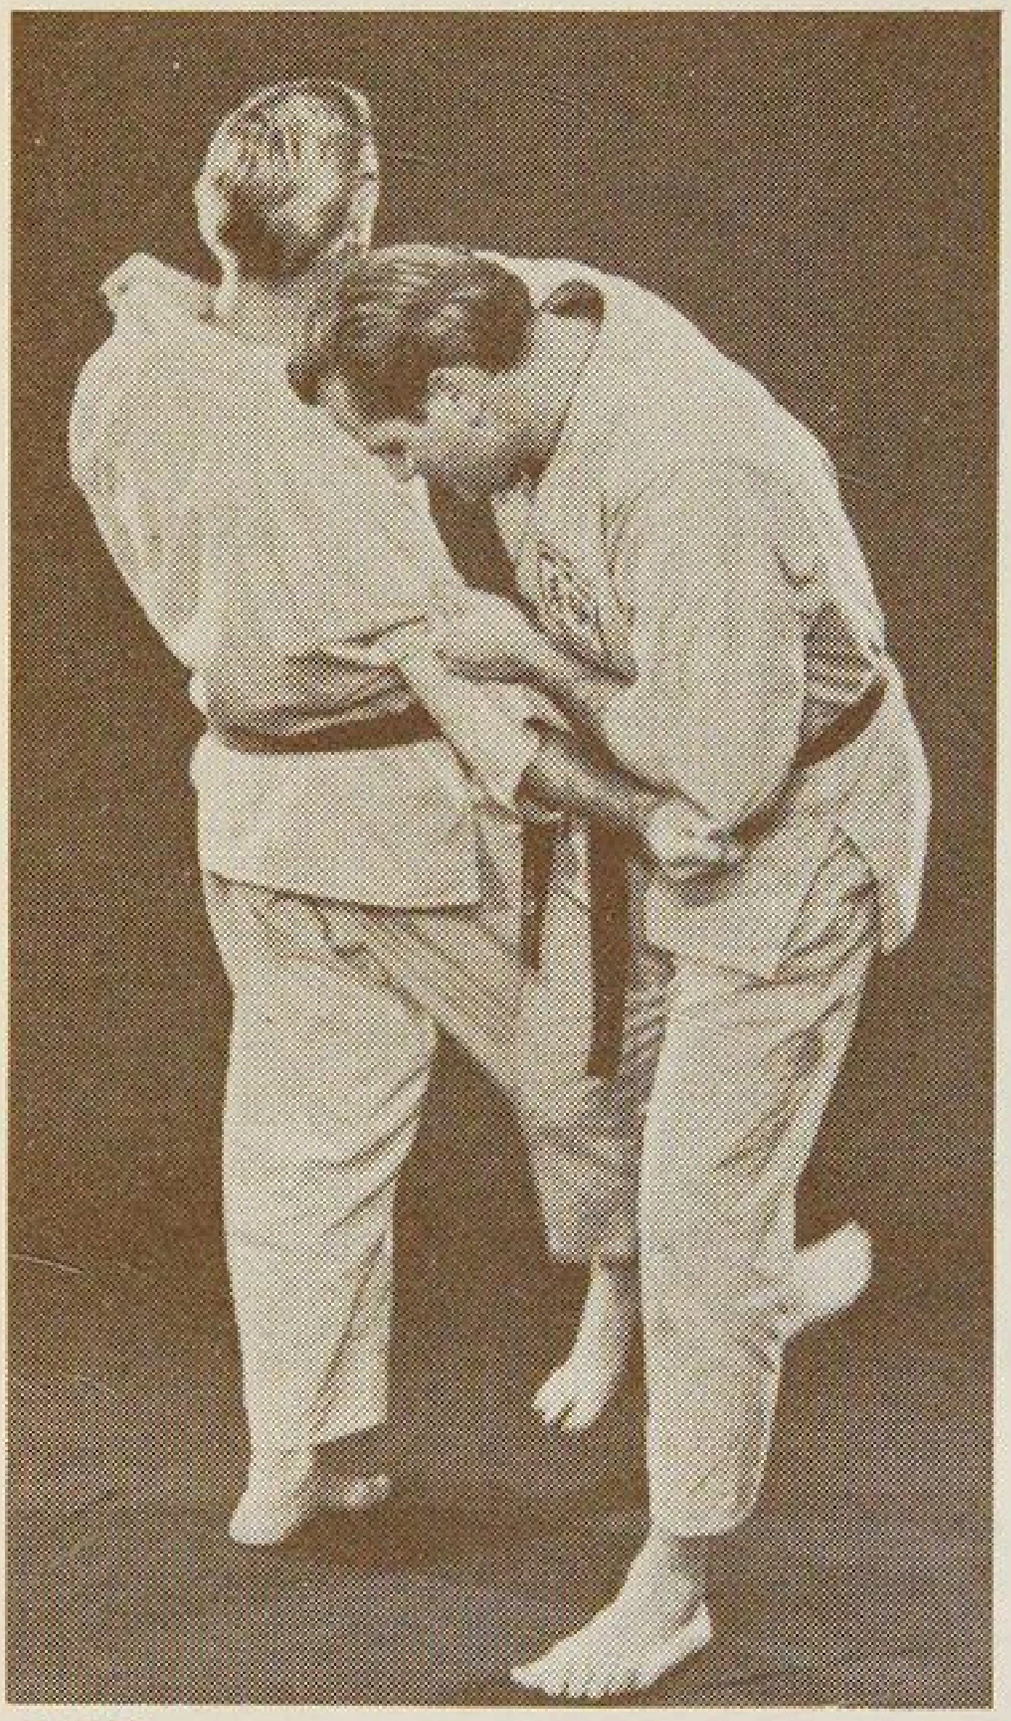
157



158. . . . simulate a vigorous kick at receiving partner's right calf with your right calf, as you twist his upper body sharply around . . .

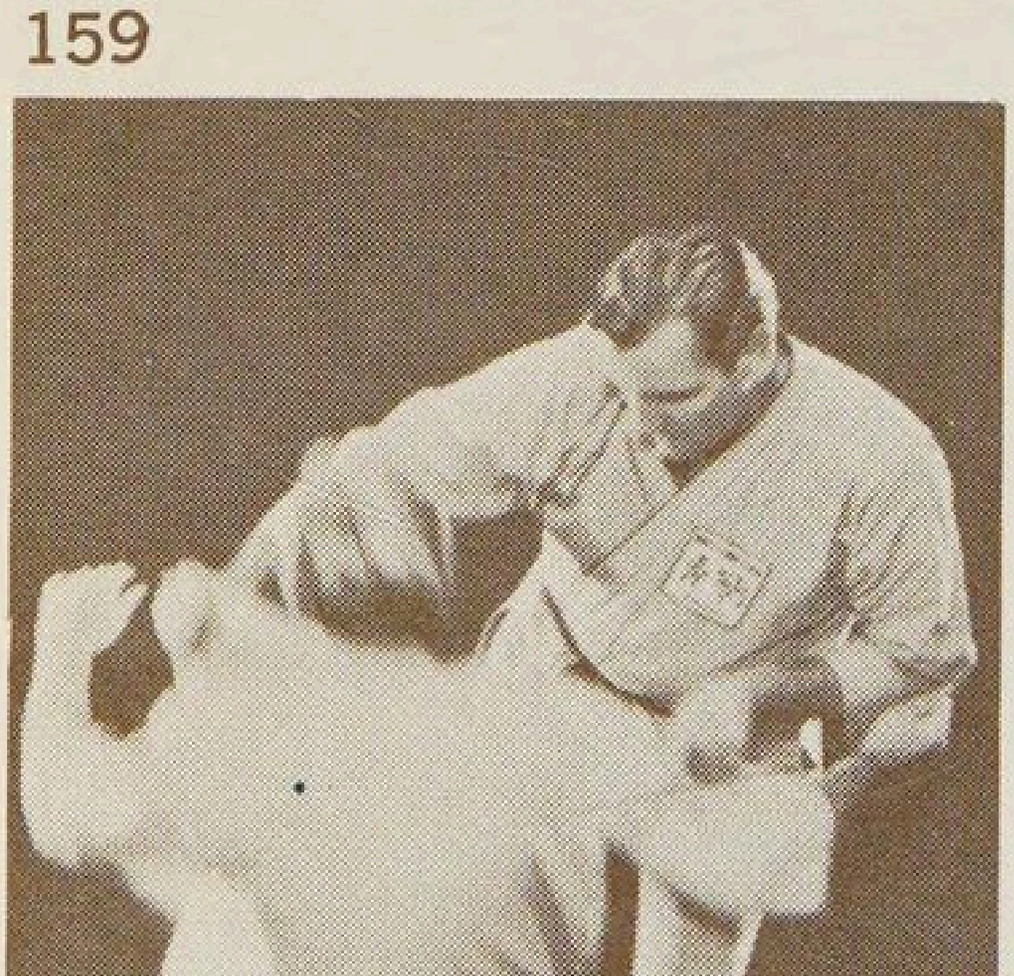
159. . . . and then down . . .

160. . . . to place him on the ground. To ease his fall, maintain your grip on his lapel and arm.

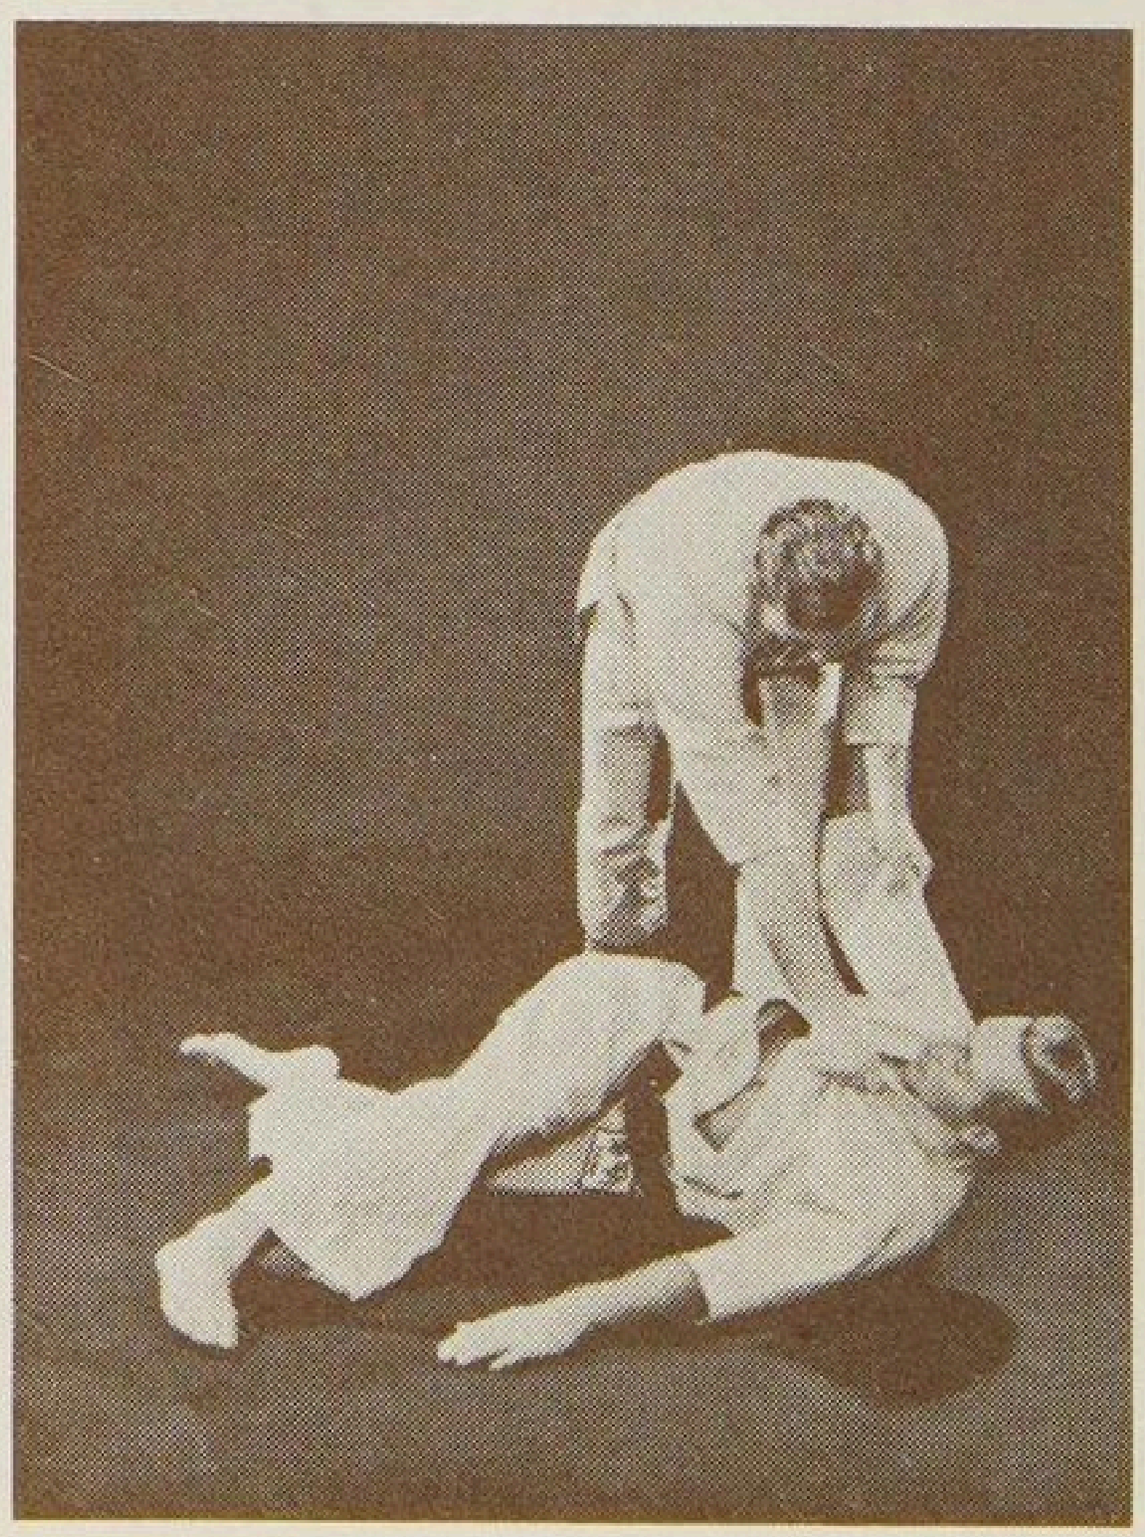


158

159



160



Avoid kicking at his leg with your heel; it must be done calf-to-calf.

DEFENSES AGAINST MINOR (NON-VICIOUS) ATTACKS

DEFENSES AGAINST WRIST GRIPS

Two-Handed Grip Against One Wrist

You will have to use your judgment to decide when a wrist grip situation is serious or minor. In itself, a wrist grip is not to be considered a violent attack, but if your adversary grips your wrist intending to immobilize you while he tries a vicious attack, then your response must be as though to a serious attack. The other situation is one in which your adversary is merely trying to play the wise guy or means to humiliate rather than harm you. In that case, your response is as to a minor attack.

161. Partner shown right grips one of your wrists with both his hands.

162. With your free hand, reach *between* his arms and grip your own captured hand; with a jerky motion, push down. His muscular reaction normally will be to oppose this pushing action by resisting upward. When you feel the upward push . . .

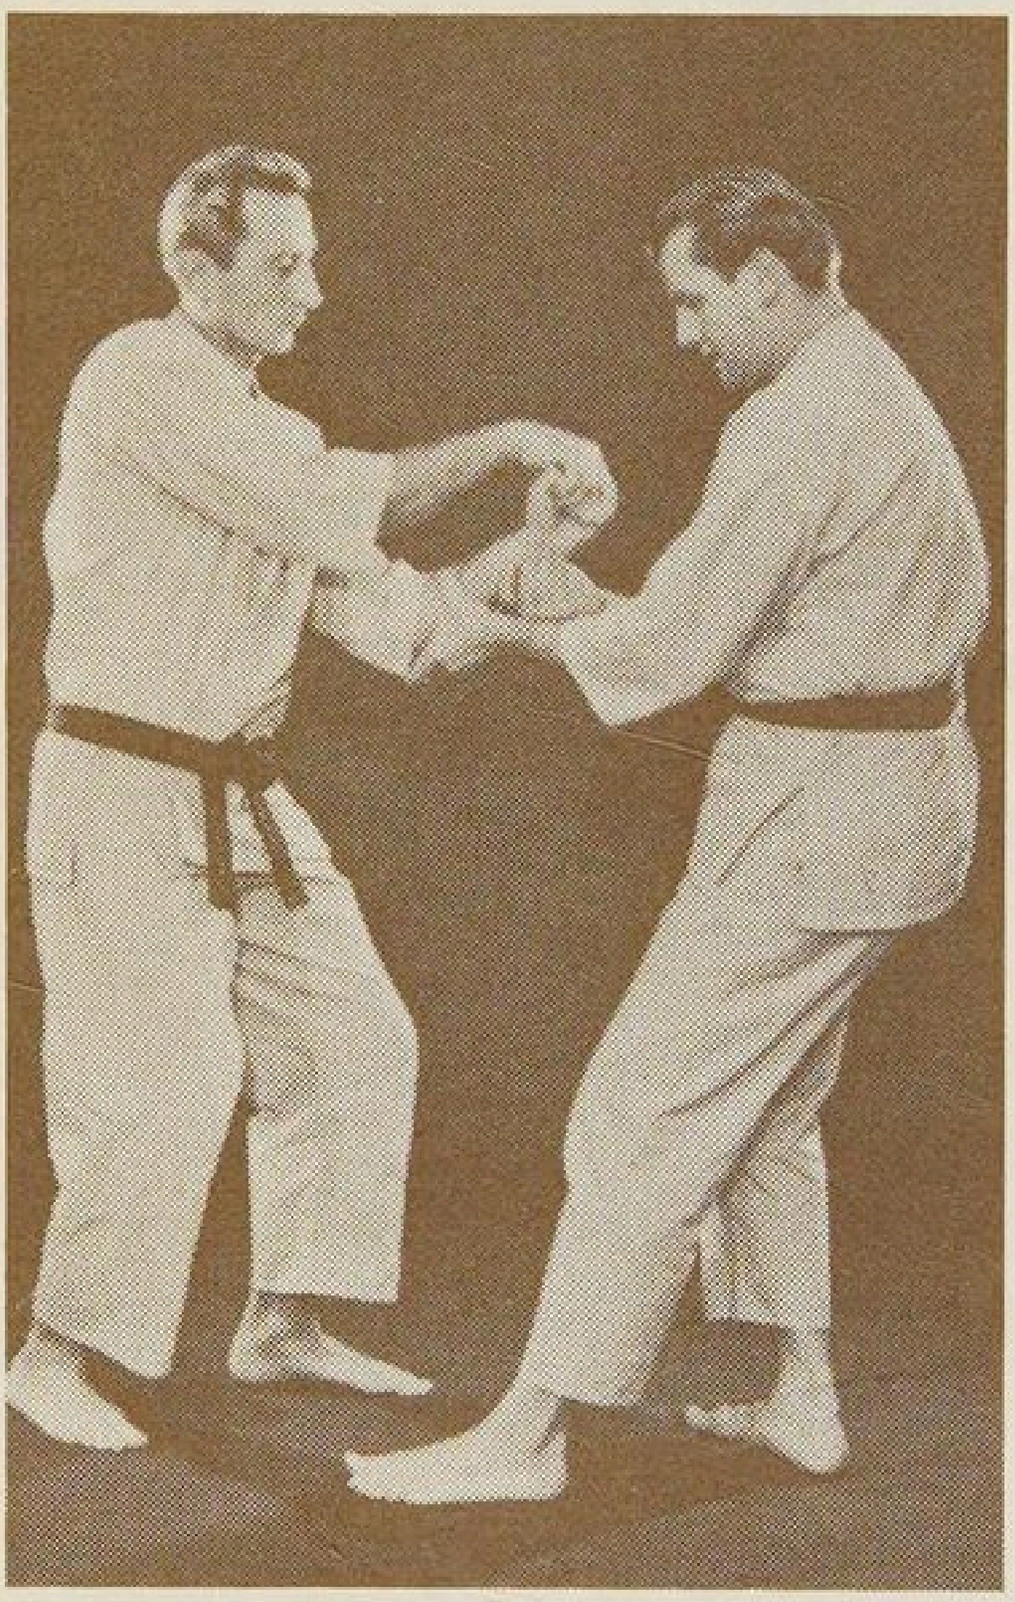
161

162

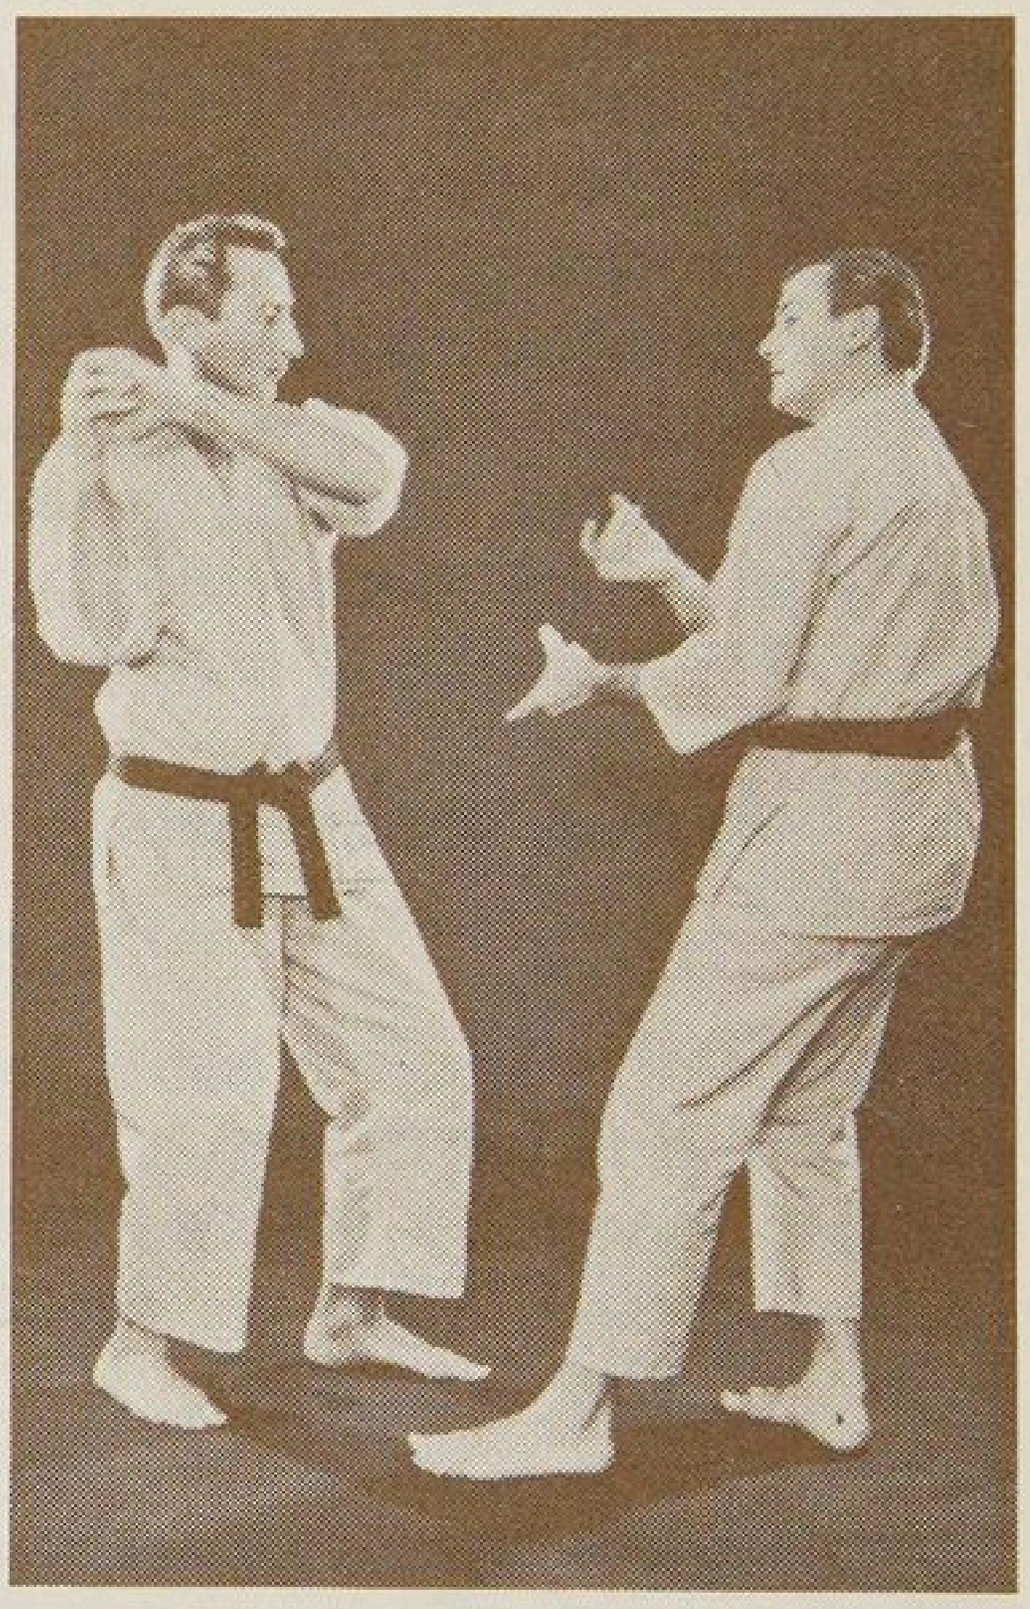
163. . . . quickly reverse your action, pulling upward with a jerky motion. The release is effected from between his thumbs (the weak area of his grip).

164. Pulling your freed arm cross-body will give more power to your release action and will protect against counter-attack. You can give even more power to your release action if you step back as you pull your arm free; step into a T-position.

163



164



If the wrist grip is of a more serious nature, you must, in addition to the release action shown, kick with vigor into his shins and knees and be prepared to use counter-blows with your hands when freed.

Exactly this same defense is used to release from a single-handed grip against either one of your wrists. Though it is not required in the test for blue rank, it should be practiced for practical use.

Two-Handed Grip Against Both Wrists

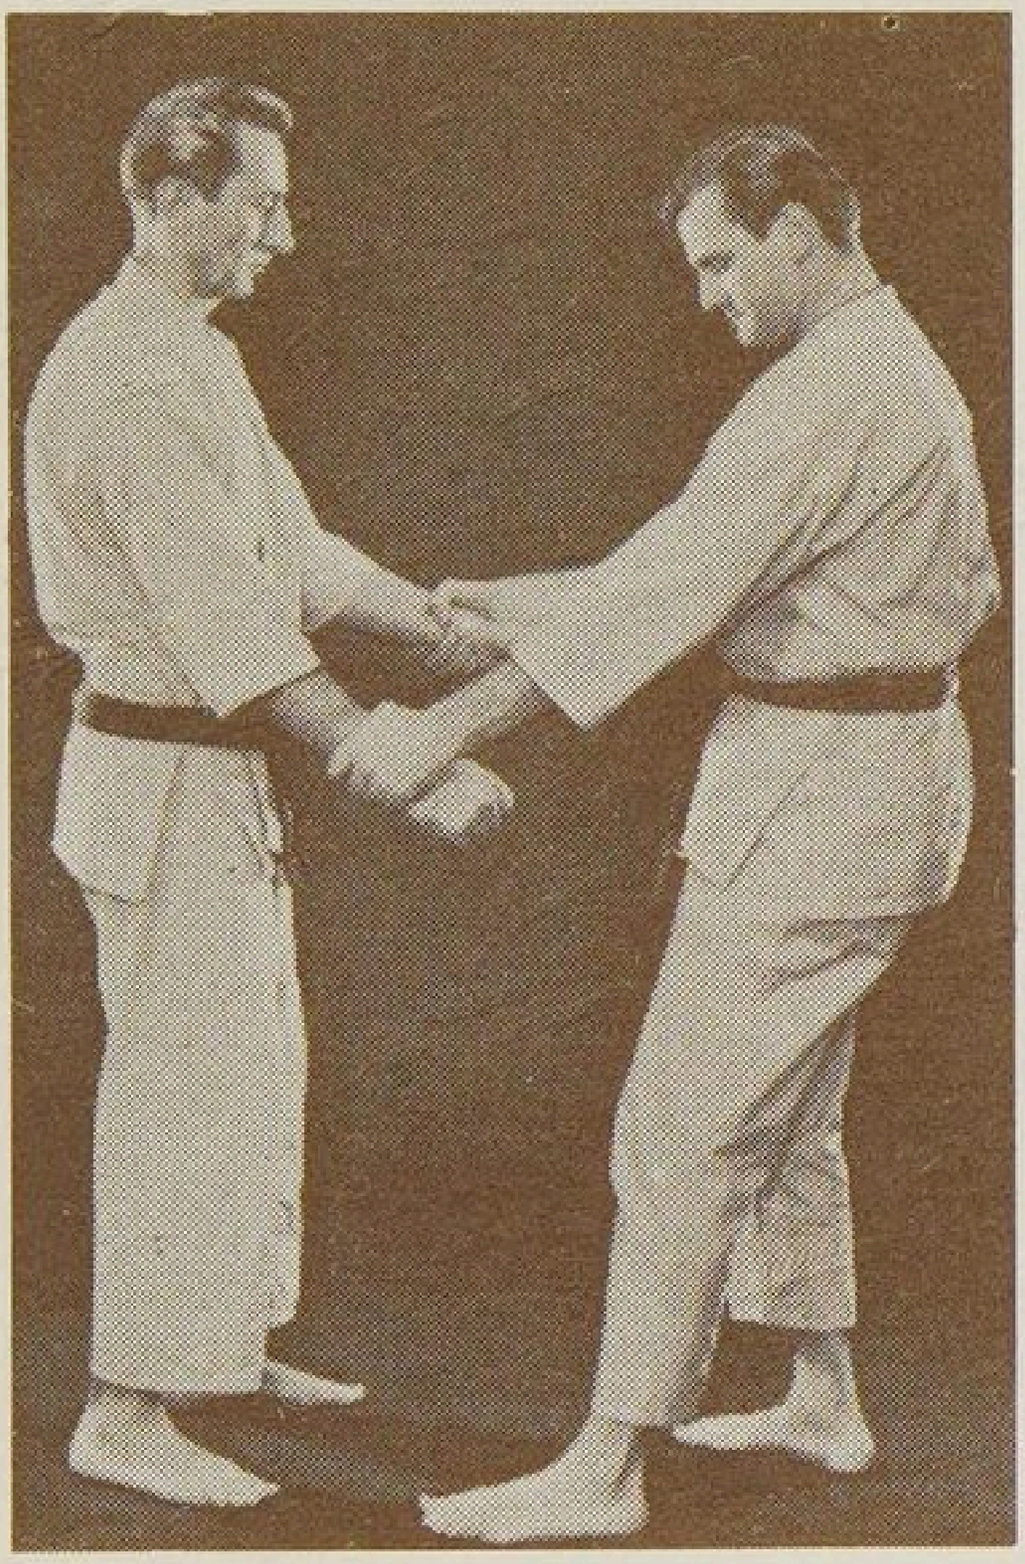
165. Your adversary, shown right, grips both your wrists with both his hands.

166. With a sharp, jerky motion, thrust both your arms outward. Even if you are tightly held, you should be able to move the slight amount necessary. His normal muscular reaction should be to resist your outward movement with an inward push. When you feel the reaction inward . . .

167. . . . with a jerky action, draw your arms inward and up sharply, effecting release from between his thumbs (the weak area of his grip).

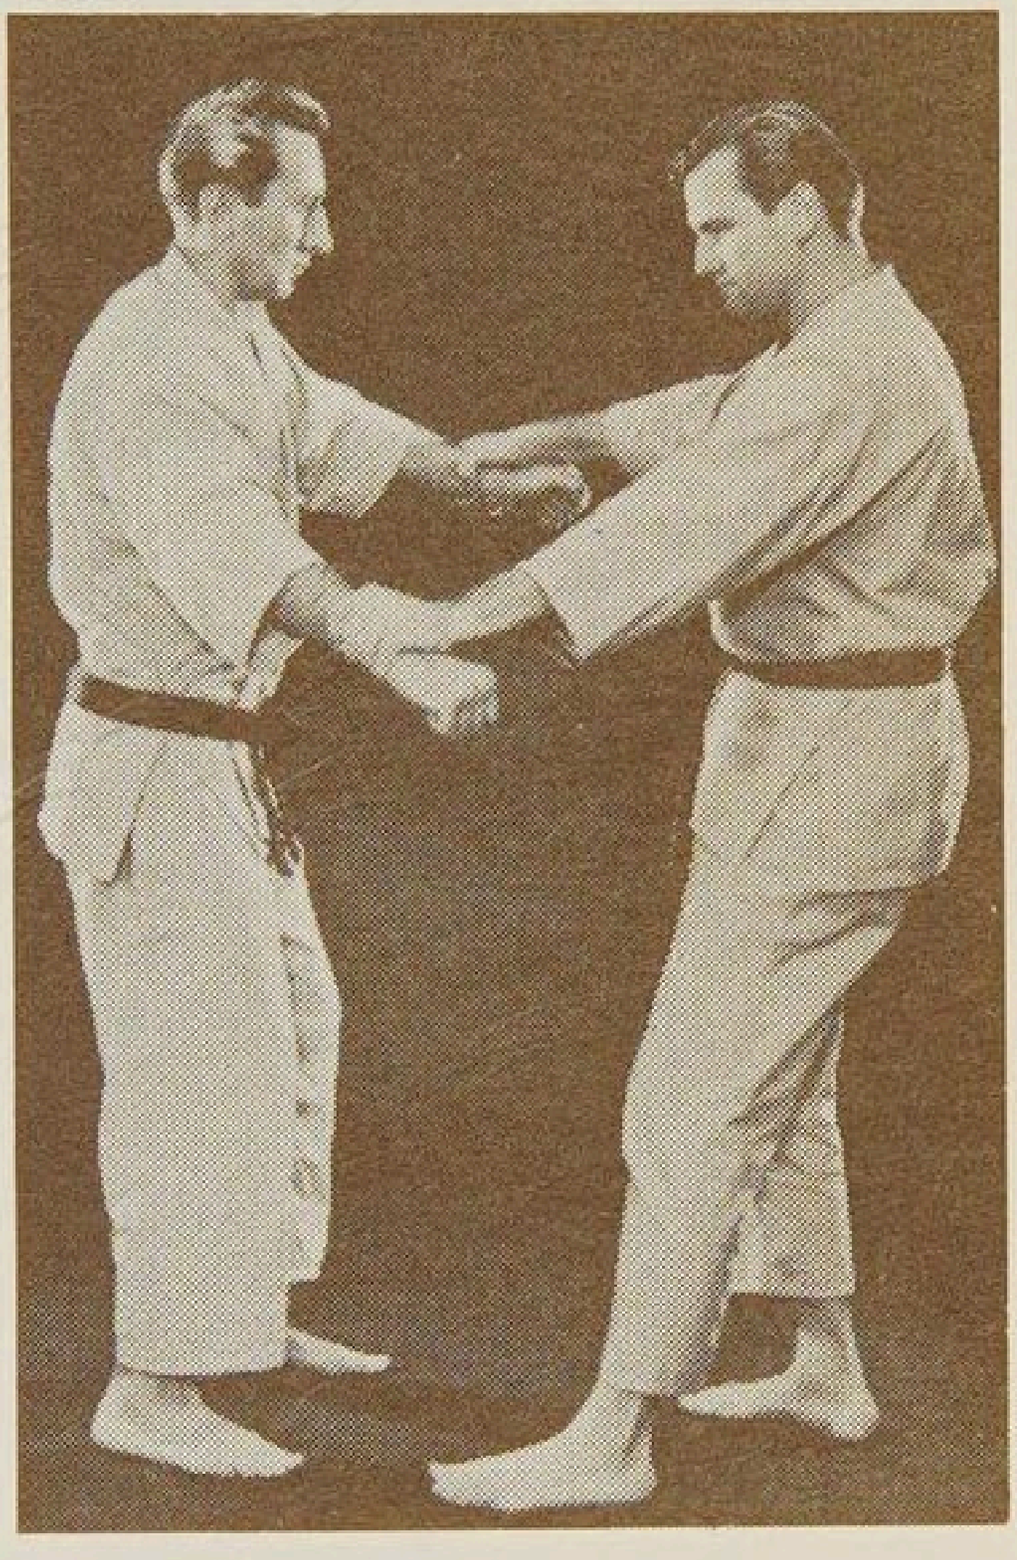
168. Carry through the action so that your fists are in front of your face, giving protection against possible counter-attack.

165



167

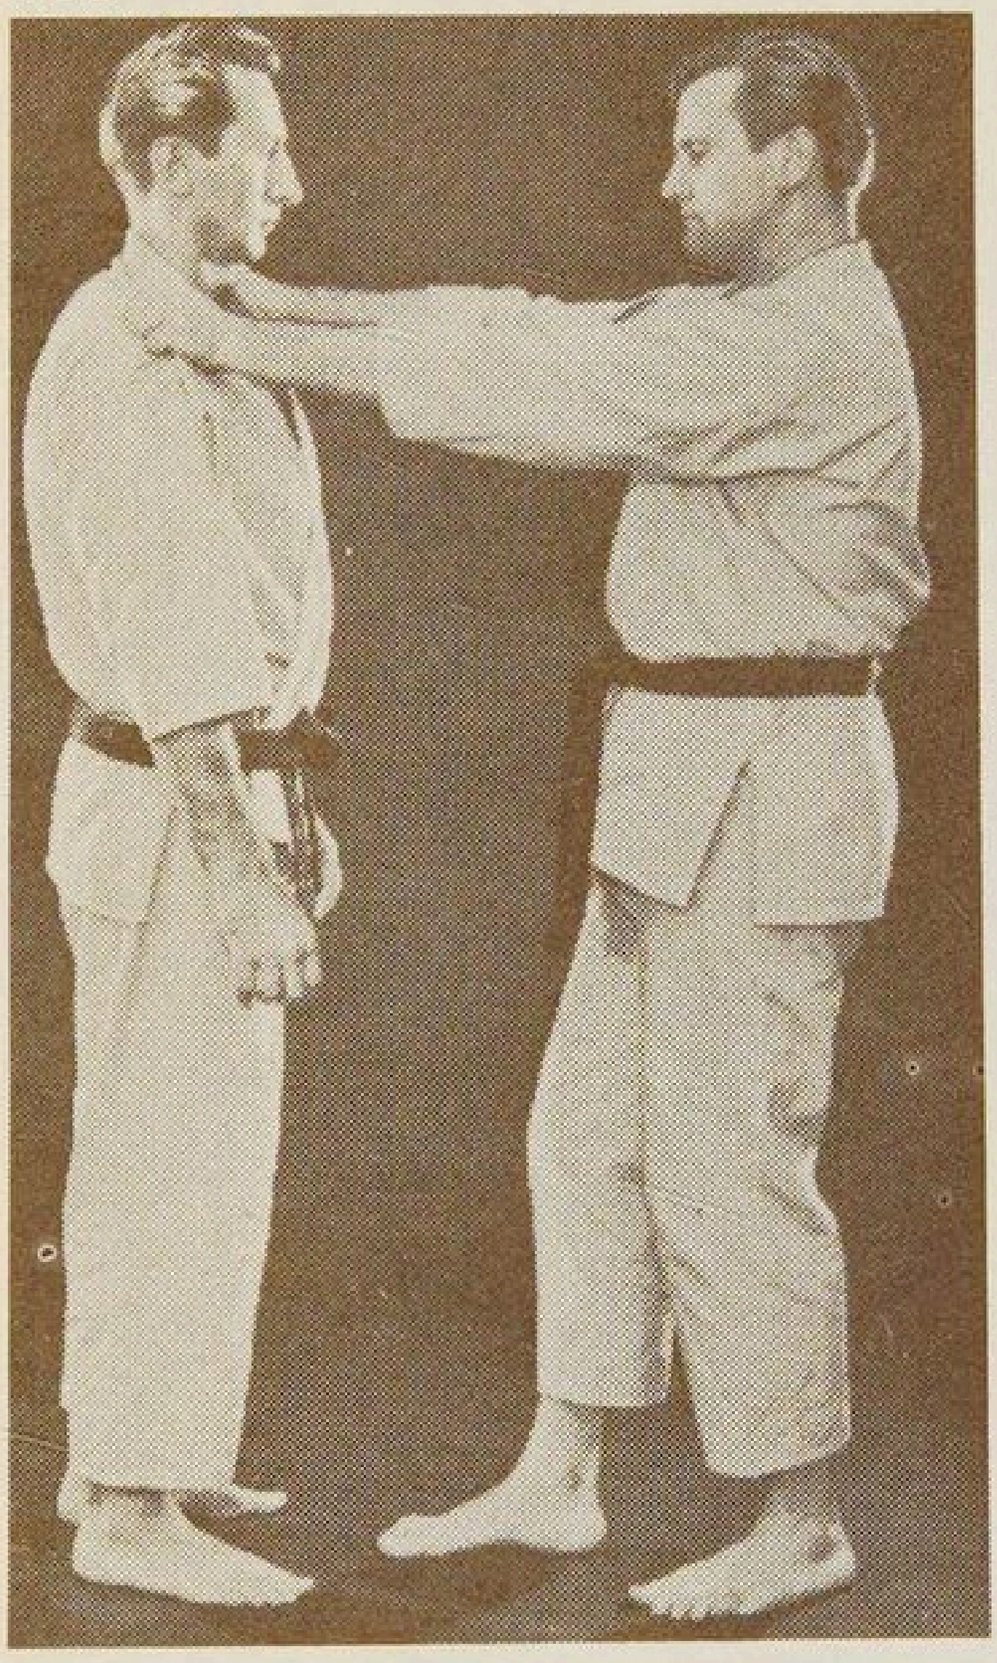
166



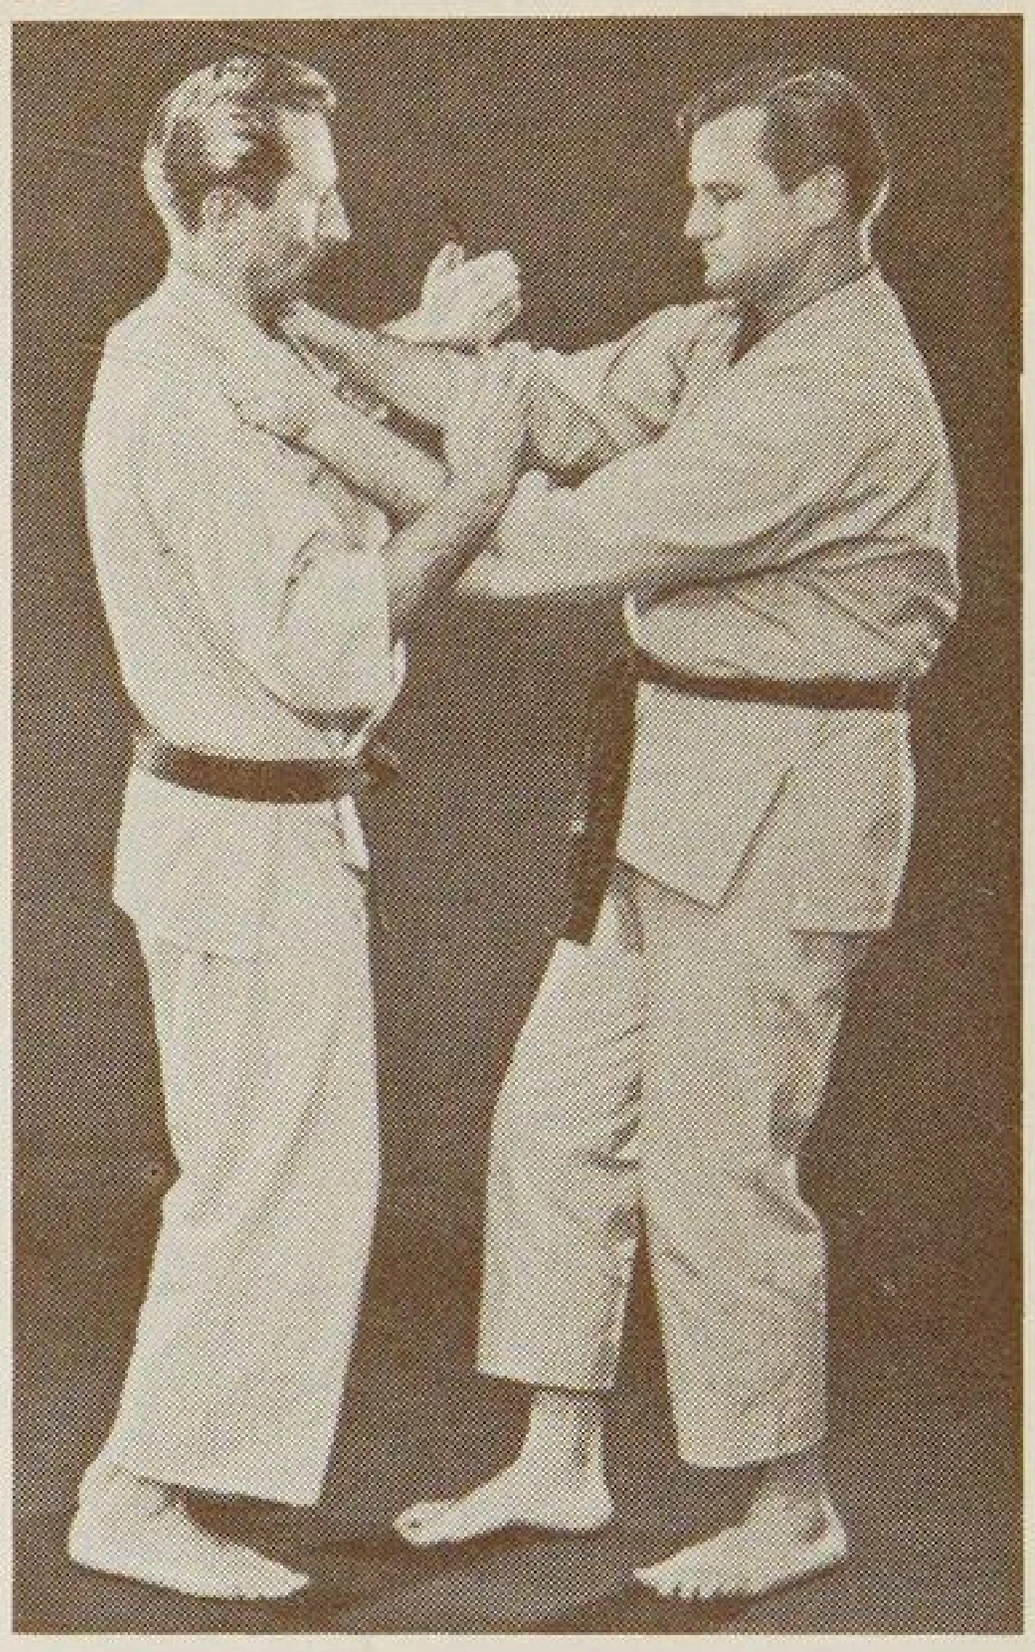
168

If the situation is one in which the adversary intends a serious attack, you will have to kick into the shins as you effect release, and be prepared for counter-blows with your freed hands.

169



170



Shoulder Grab Defense

Shoulder grabbing is ordinarily done by someone who is being annoying rather than vicious. Your response should be appropriate.

169. Adversary, shown right, grips your shoulders.

170. With both your hands, slash down onto the forearm nerve centers of both his arms.

171. Retaliation, if any, should be appropriate to the situation. For a non-violent situation, stabbing into the neck muscle is effective and sufficient. Unless the threat of danger is great and violent, avoid striking into the windpipe or throat. It might be necessary to kick into the shins if your adversary has a very strong grip and is much larger than you are.

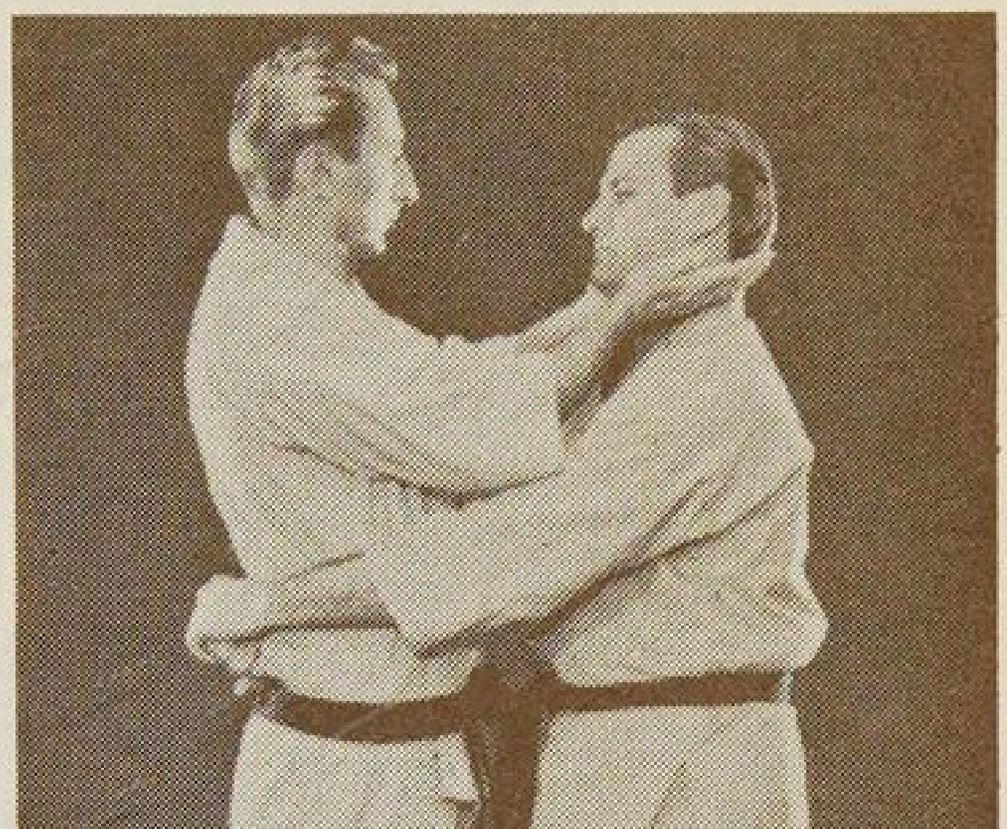
Front Under-Arm Grab Defense

172. You can apply this defense before an adversary has actually grabbed, but shown here, partner at right has effected body grip around the waist, under the arms. Strike with both hands into both sides of his neck.

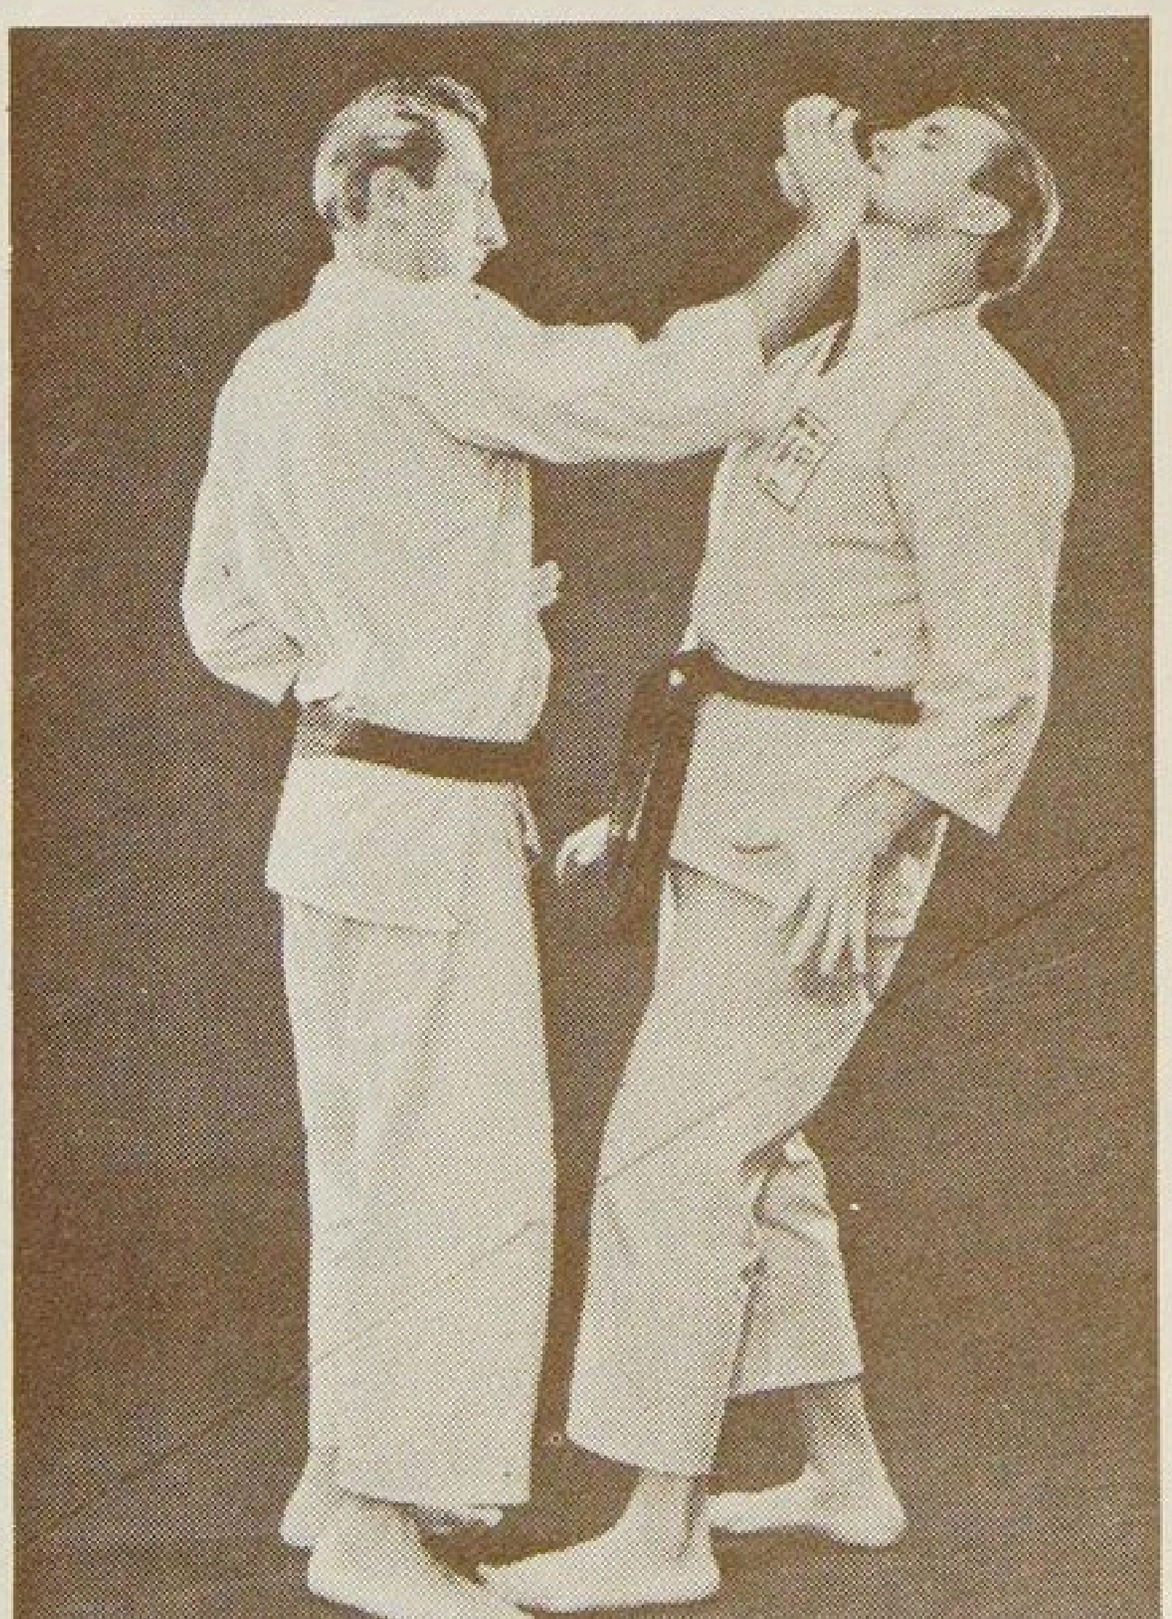
173. If attack is minor (his intention is to annoy, rather than harm), push him away, using the palm of your hand under his chin; if it is more serious, use the same blow in a more vigorous, smashing action. Kicking into the shin may also be used to effect release.

171

172



173

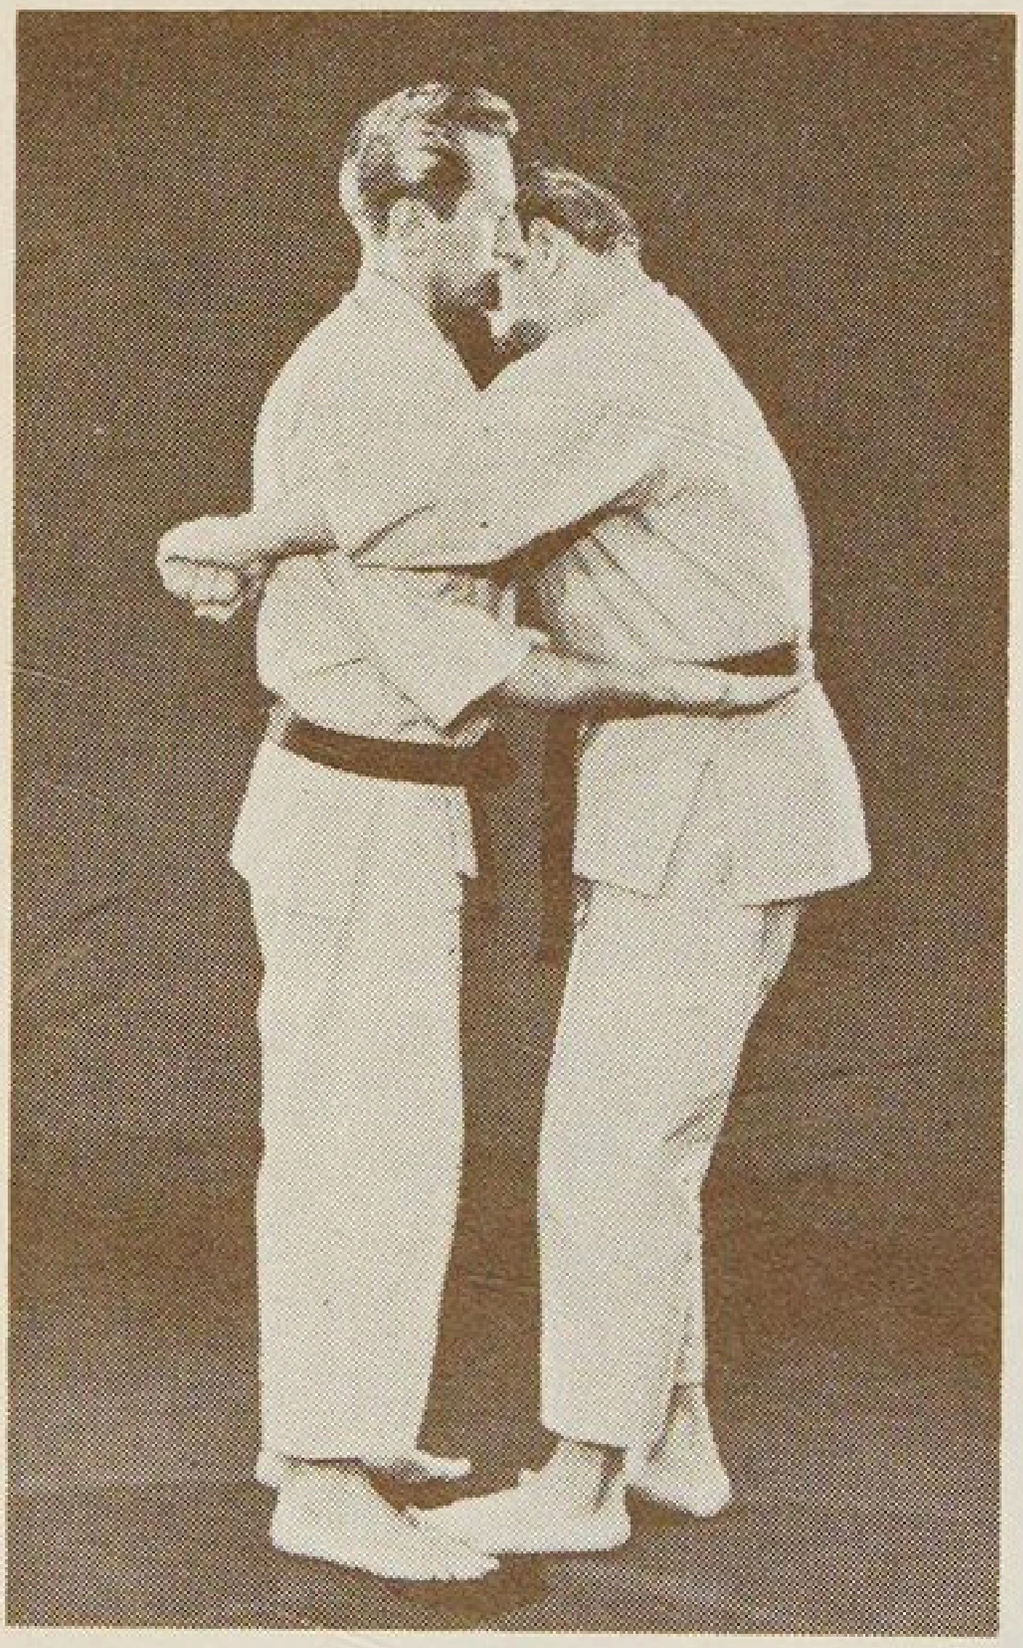


Front Over-Arm Grab Defense

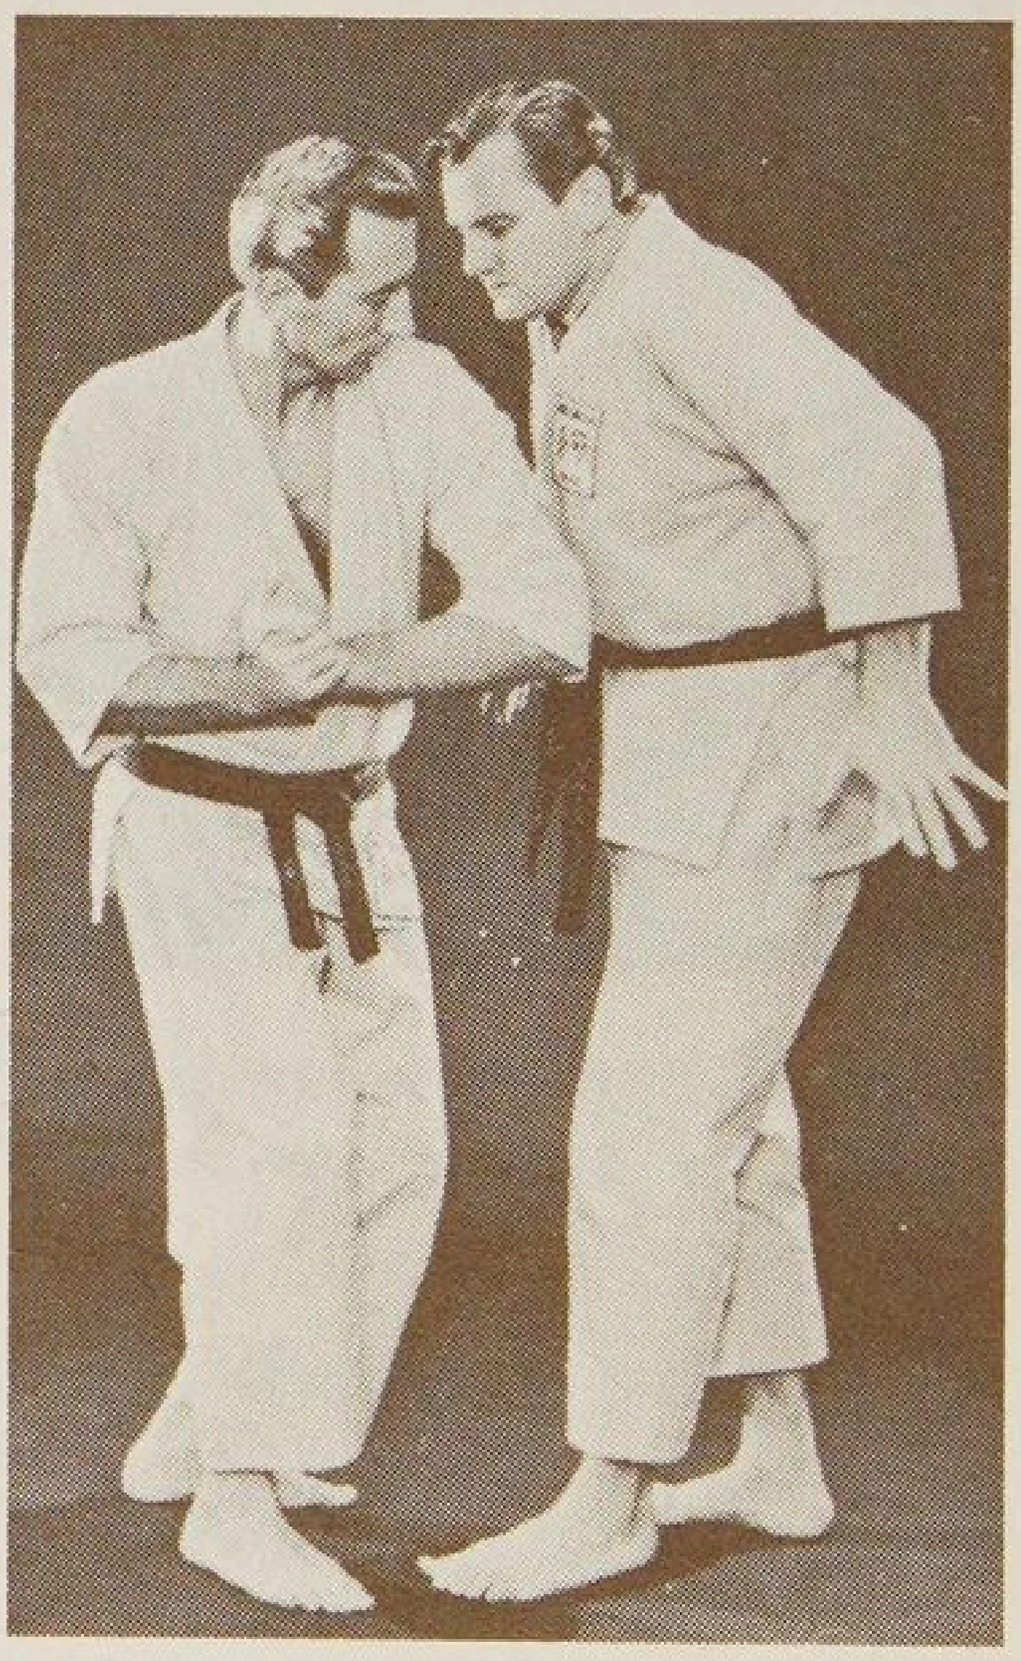
174. It is not necessary to wait until your adversary has completed the grab to use this defense; it is better to go into action as he attempts the grab. Shown here, right partner has effected a front body grab over the arms. With both your hands, strike into both his sides, just below the last rib. If his grip is very strong, you may need to kick into the shins or onto the instep to loosen his grip and allow you to strike with your hands.

175. If necessary, retaliate with an elbow blow into the midsection.

174



175



DEFENSES AGAINST VIOLENT ATTACKS

Close-In Fist Attack: Grab and Hold Defense

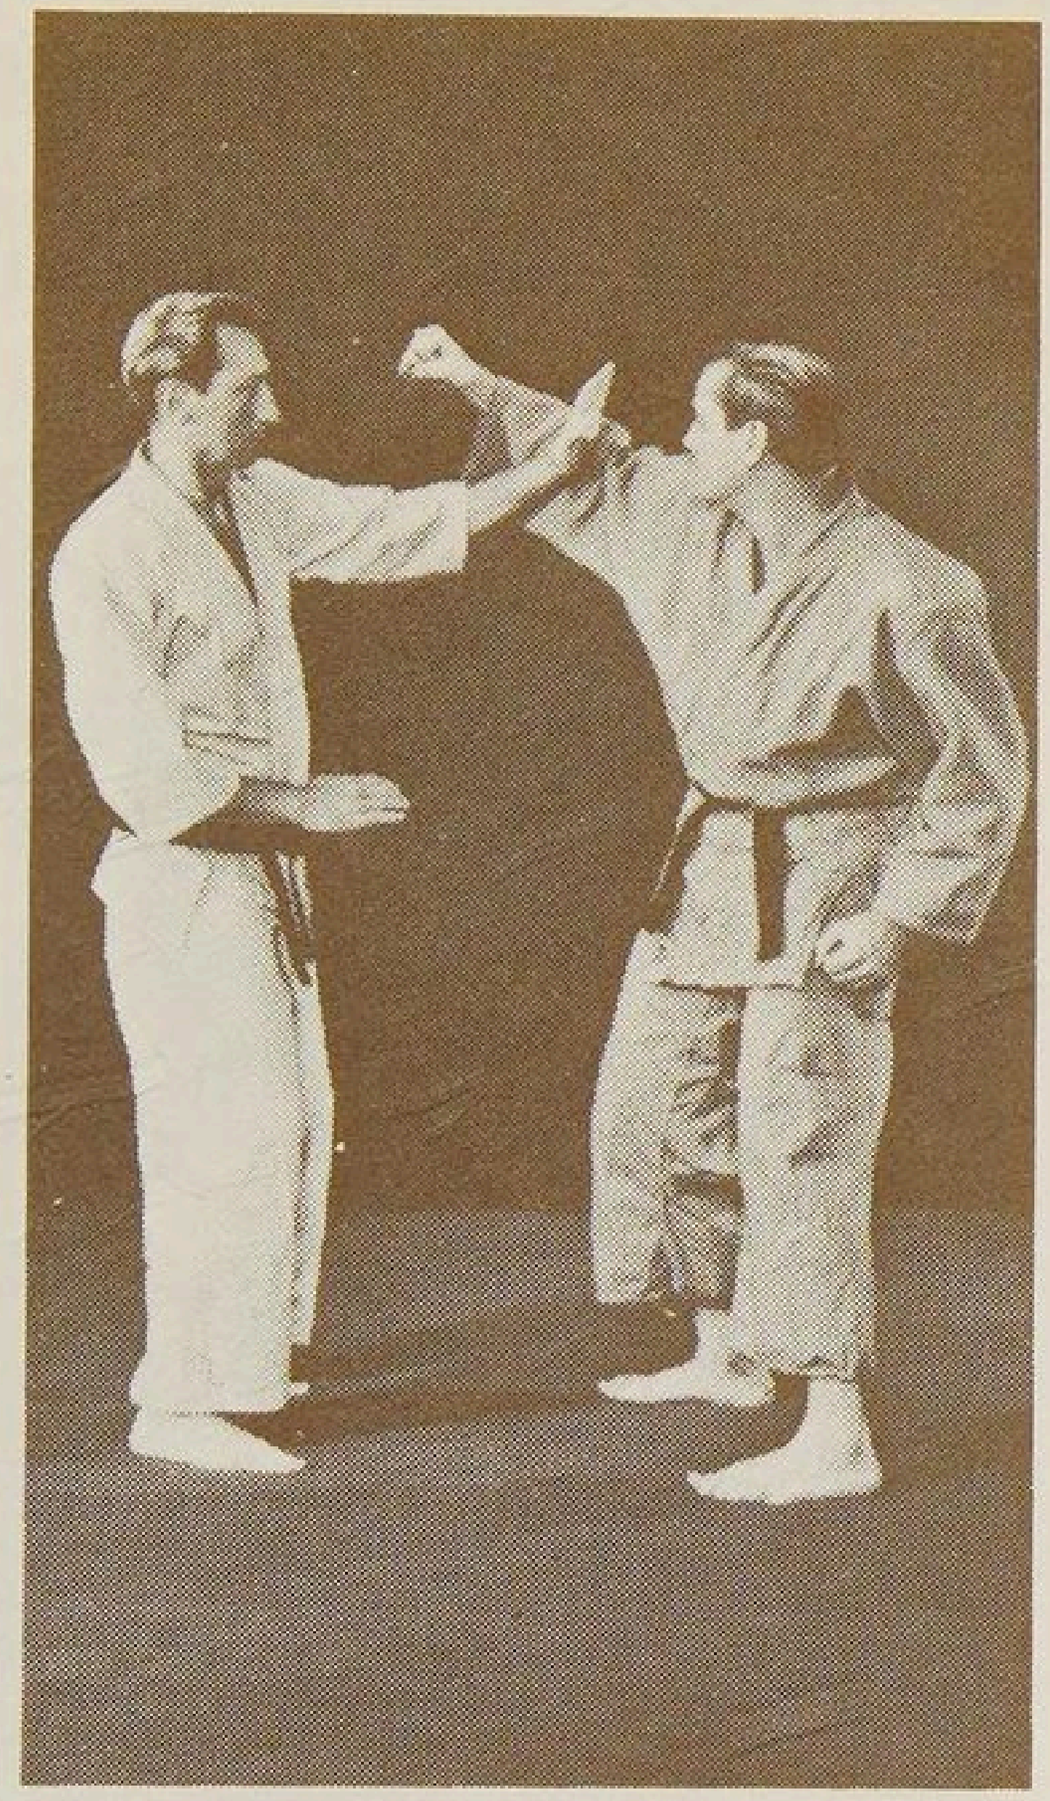
176. Right partner simulates fist attack, close-in. You slash at striking arm . . .

177. . . . and then at the other arm, whether or not it is striking at you.

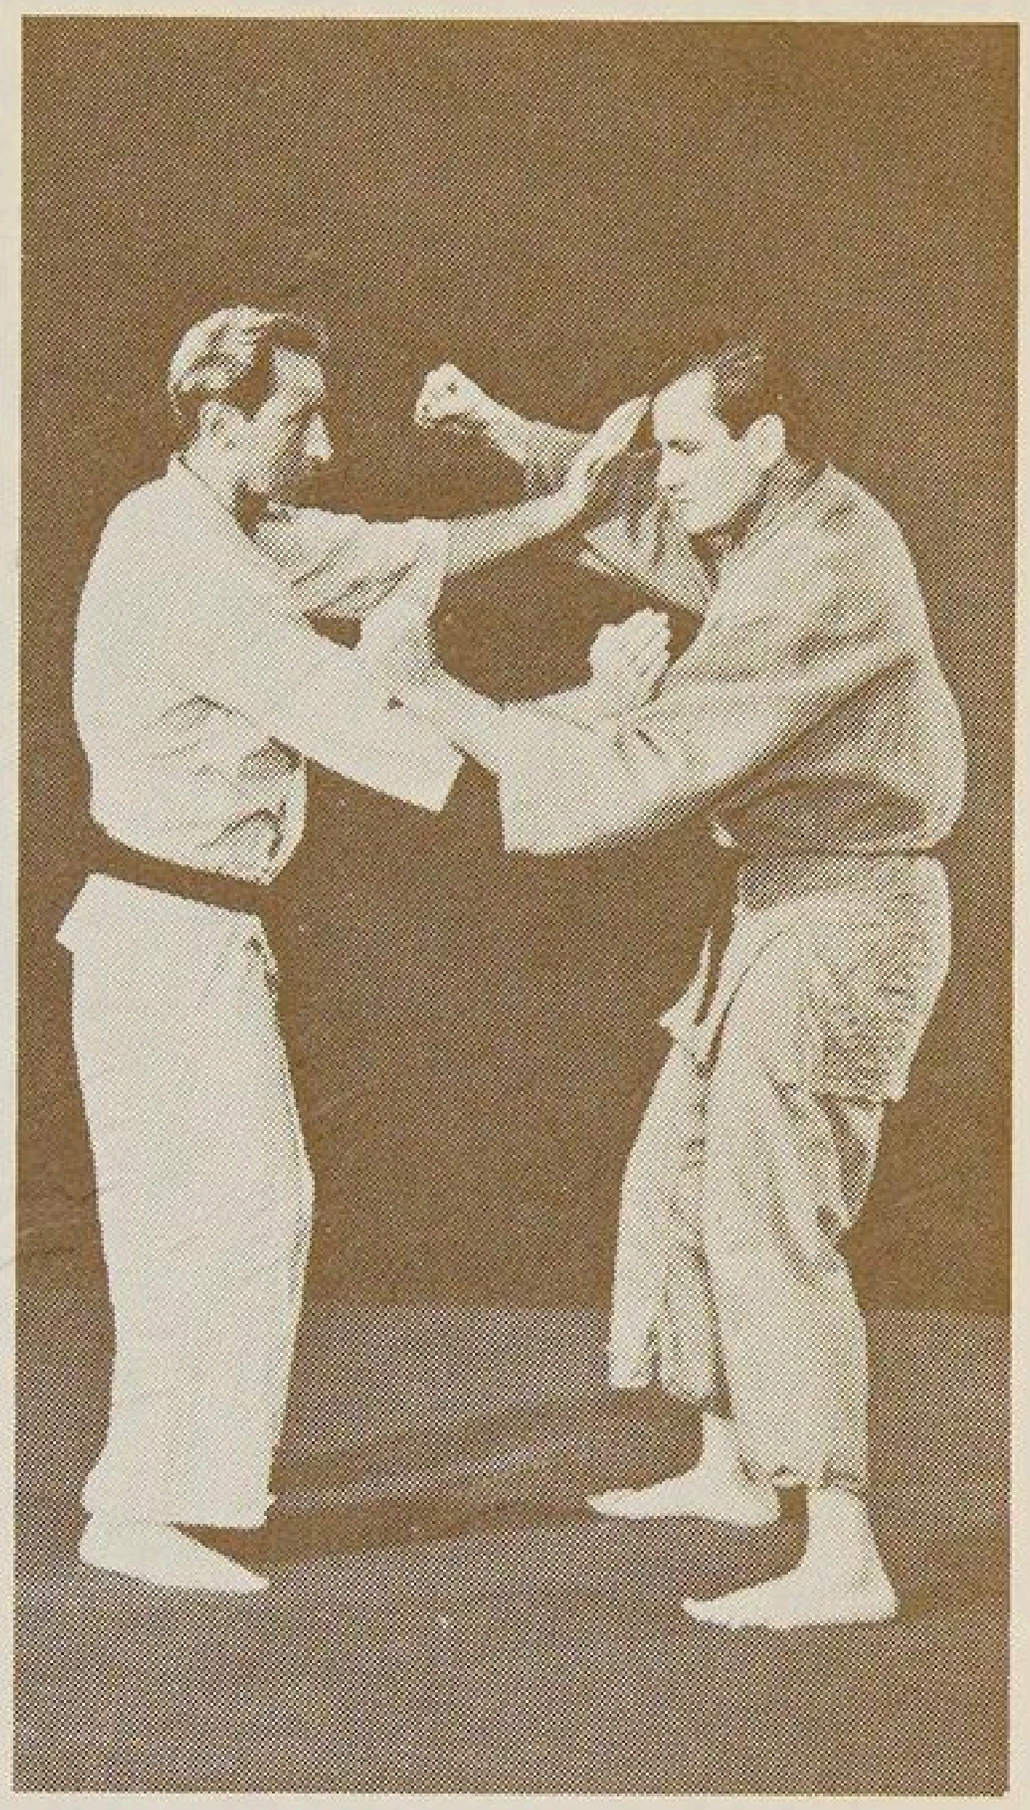
178. With both hands, grip cloth (or arms) at about the elbows and stiffen your arms to immobilize his arms for a moment . . .

179. . . . while you begin your retaliatory kicks, first into one leg . . .

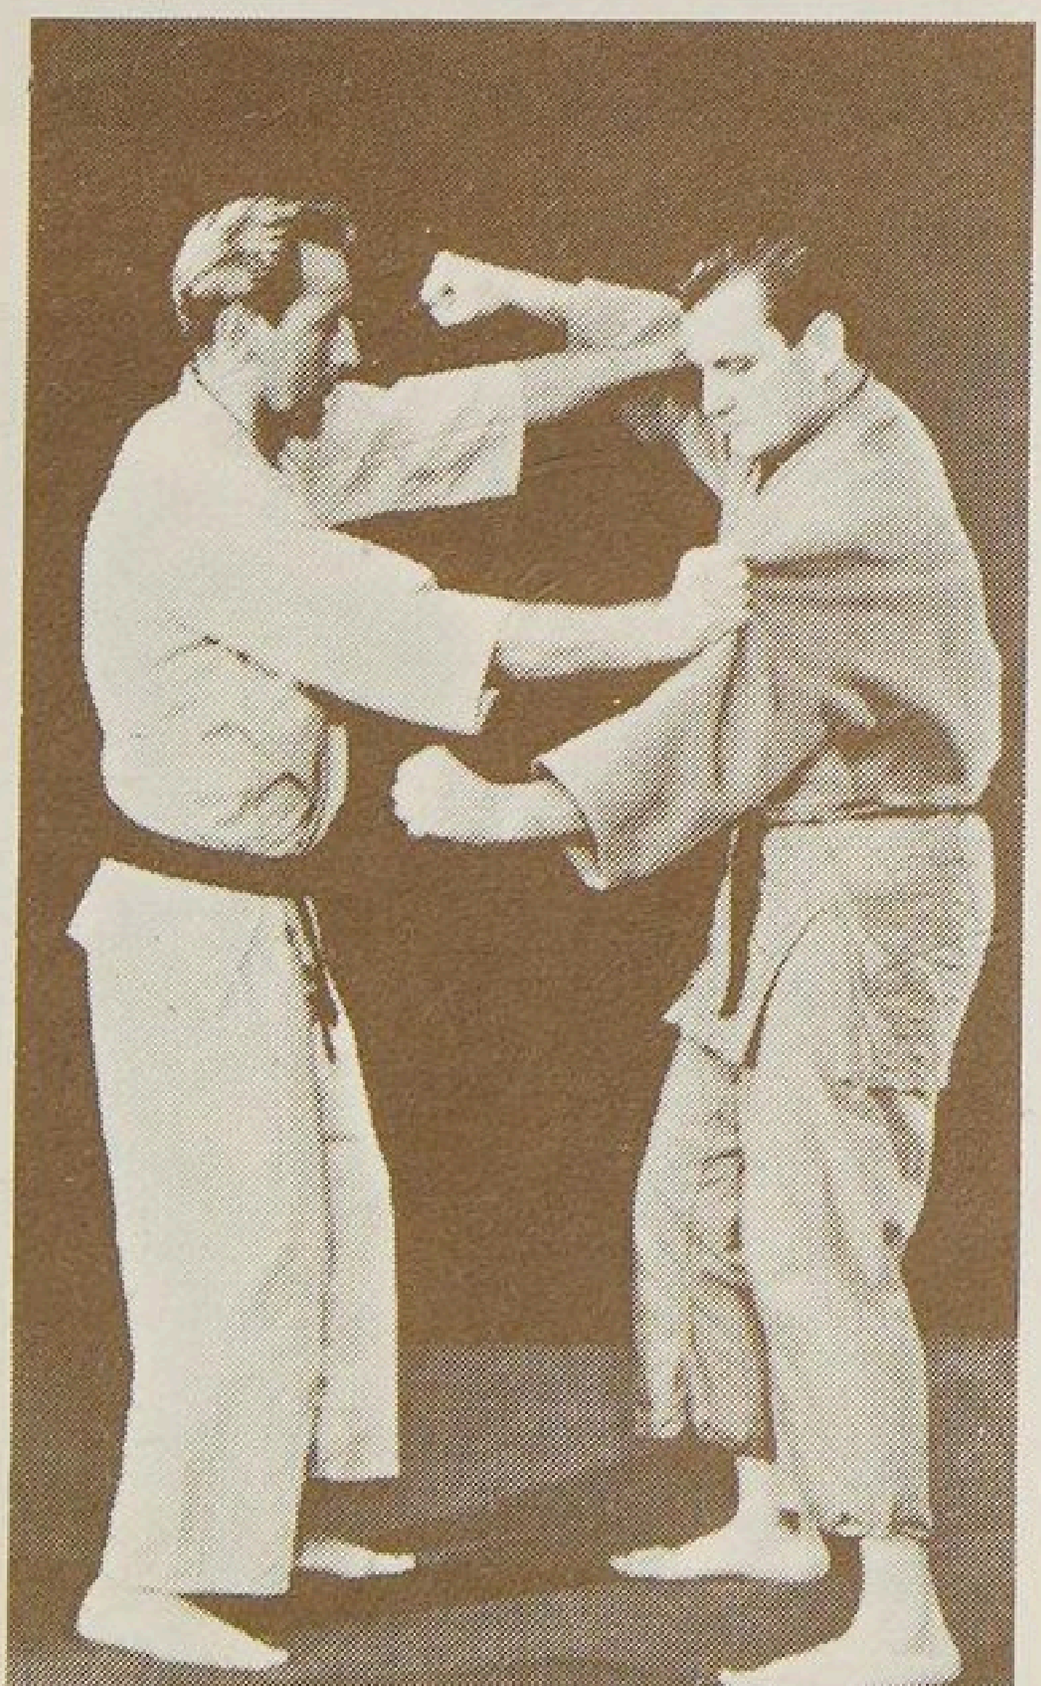
176



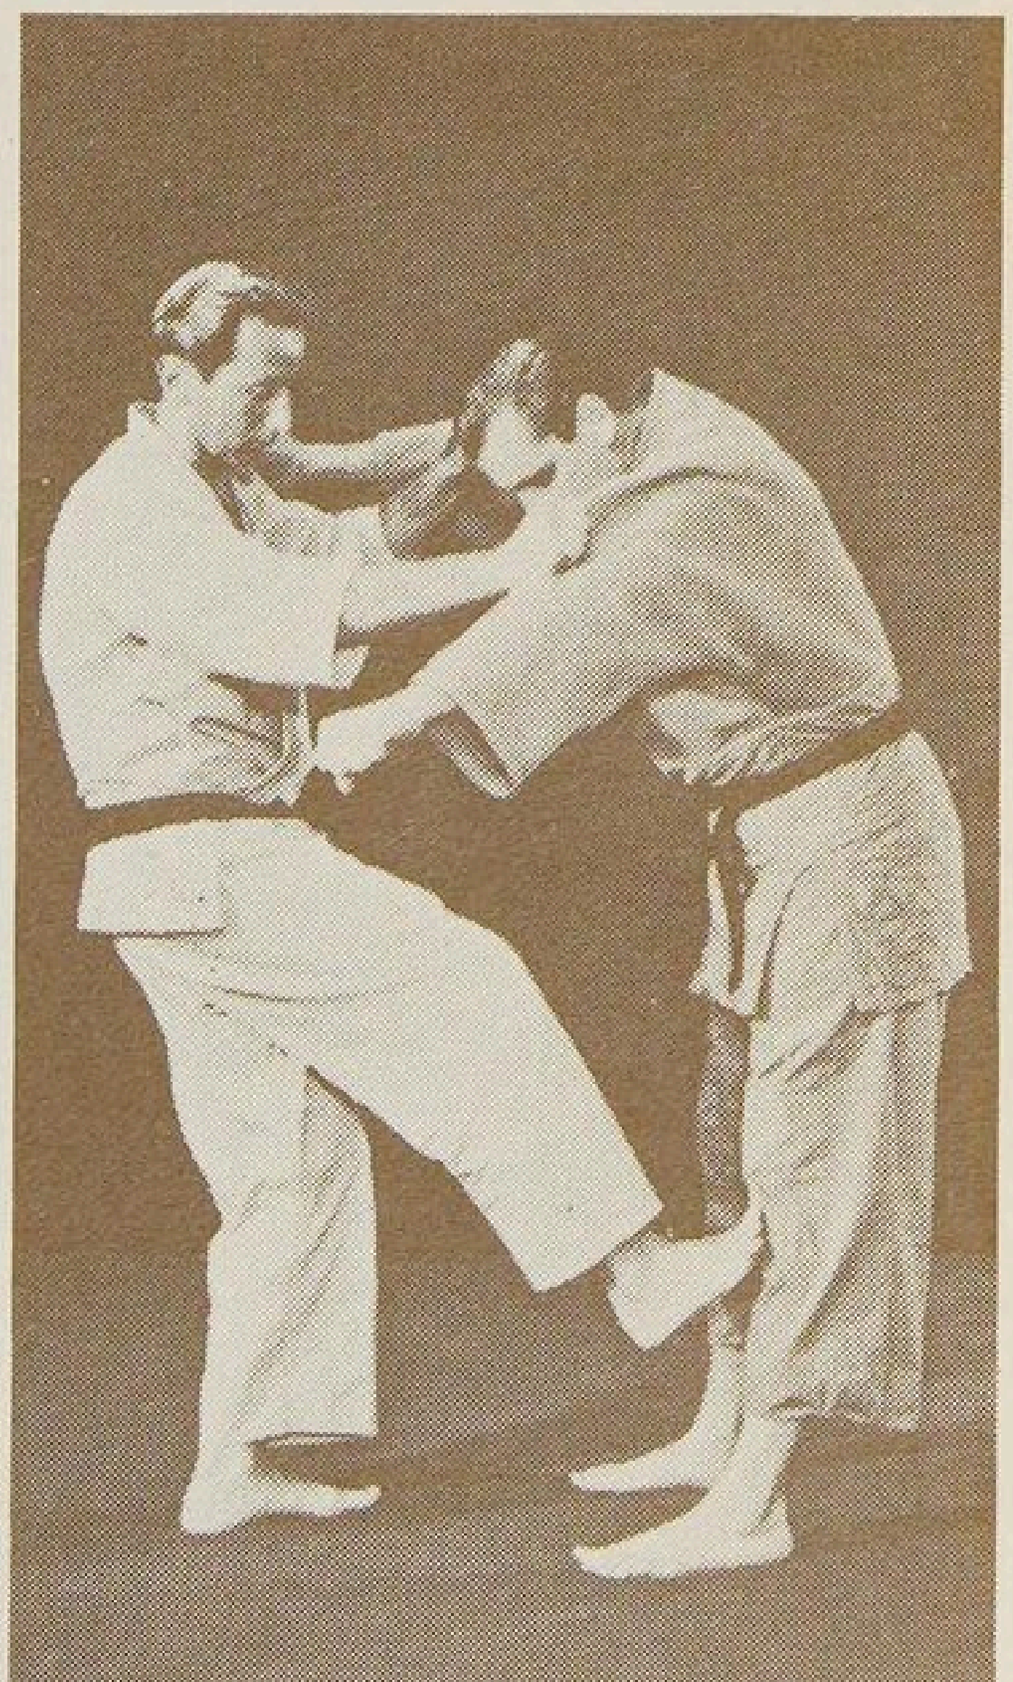
177



178



179

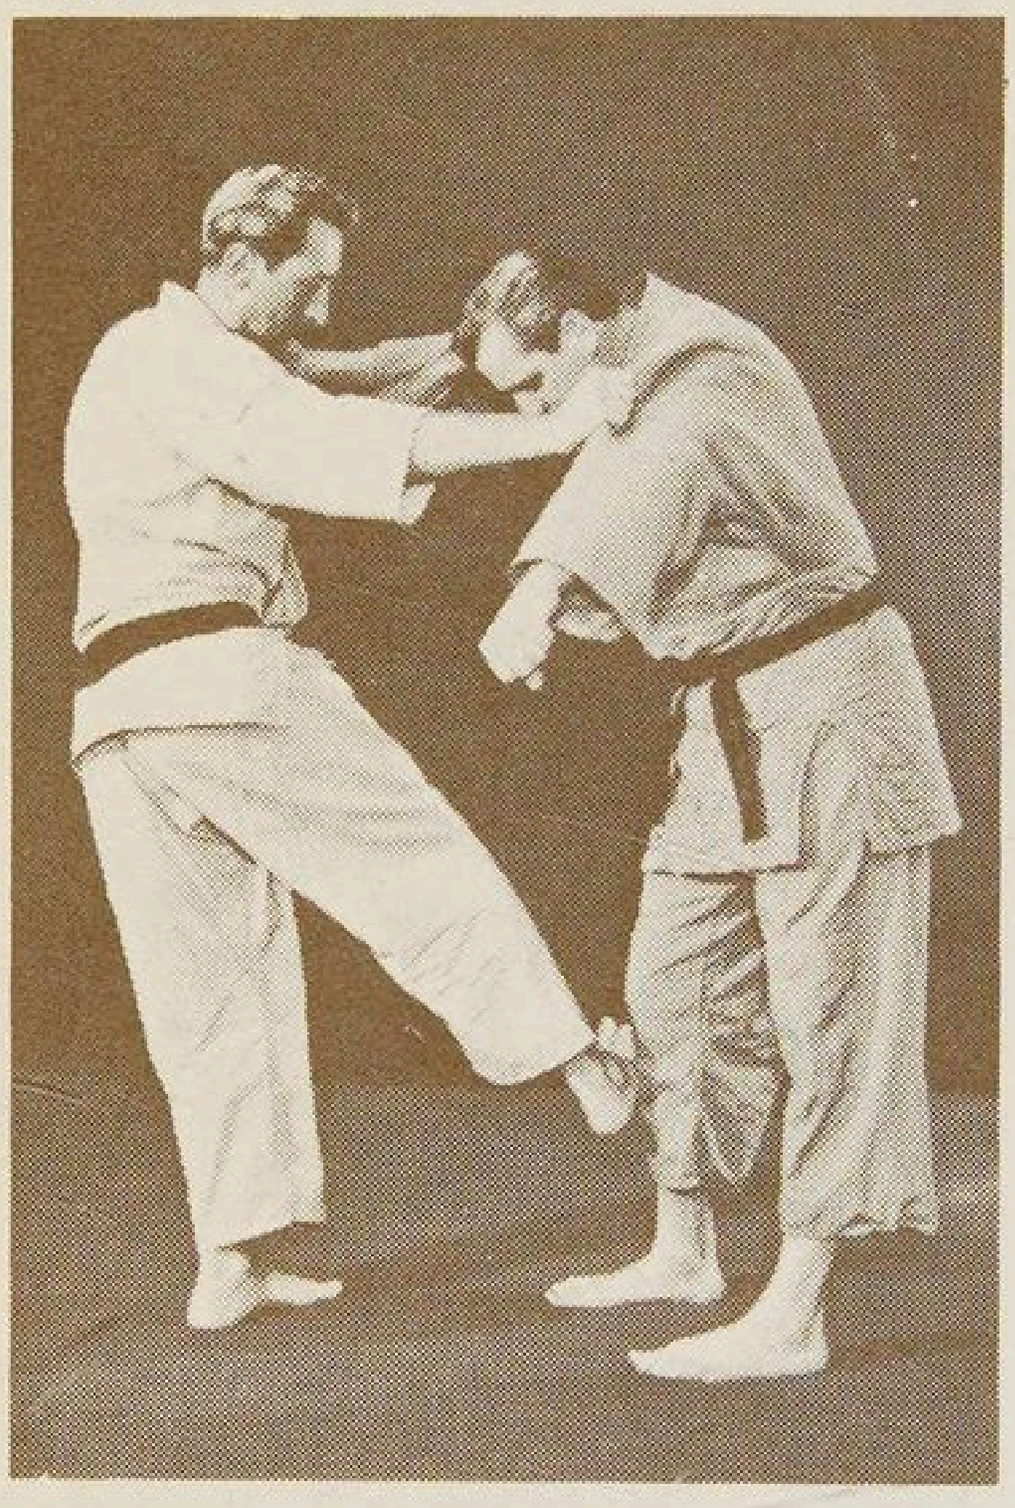


180. . . . and then into the other.

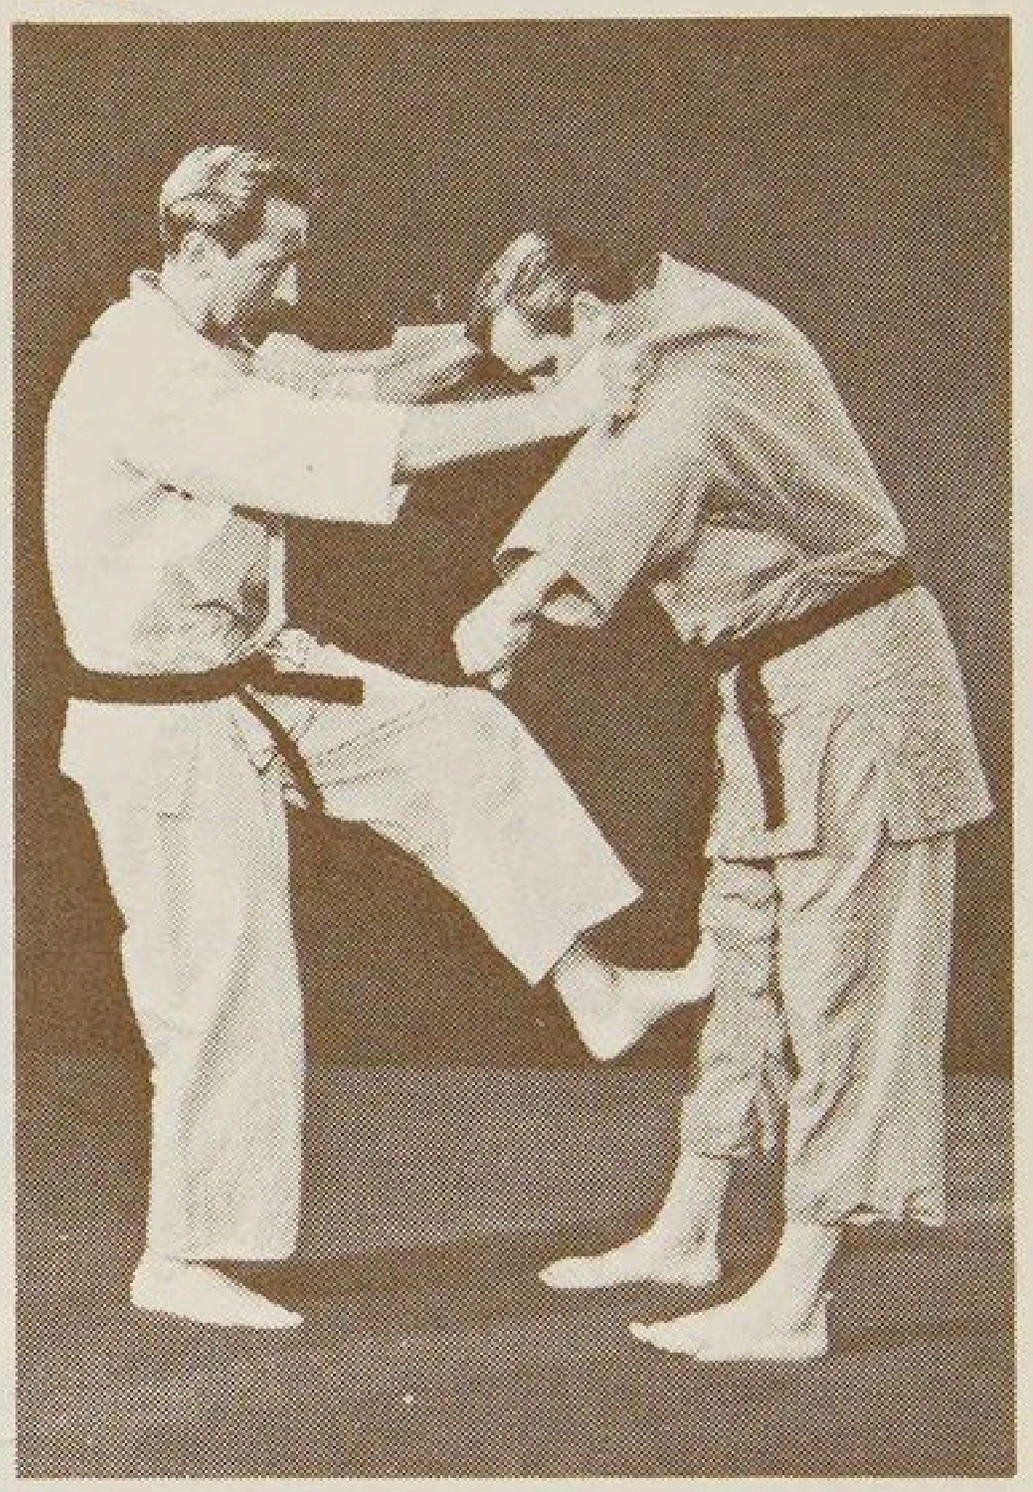
181, 182. Follow the first two kicks with two more kicks using your other foot.

183. After thus weakening and hurting him, turn him around using a thrusting, vigorous action.

180

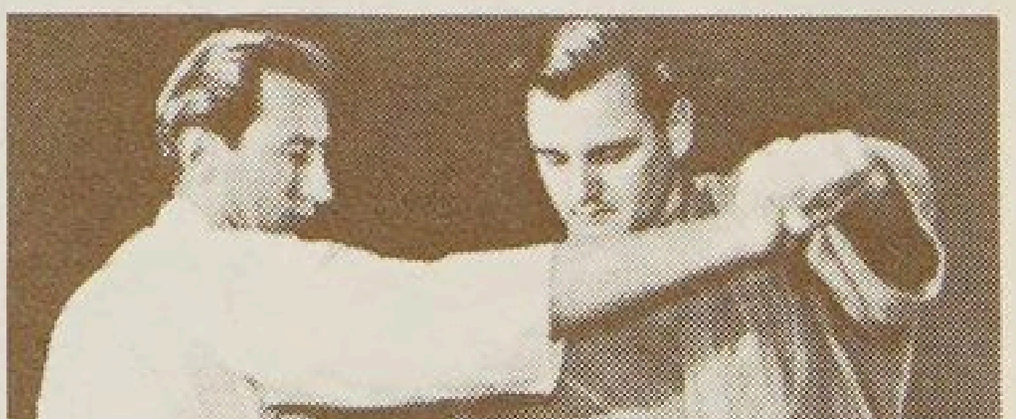


181



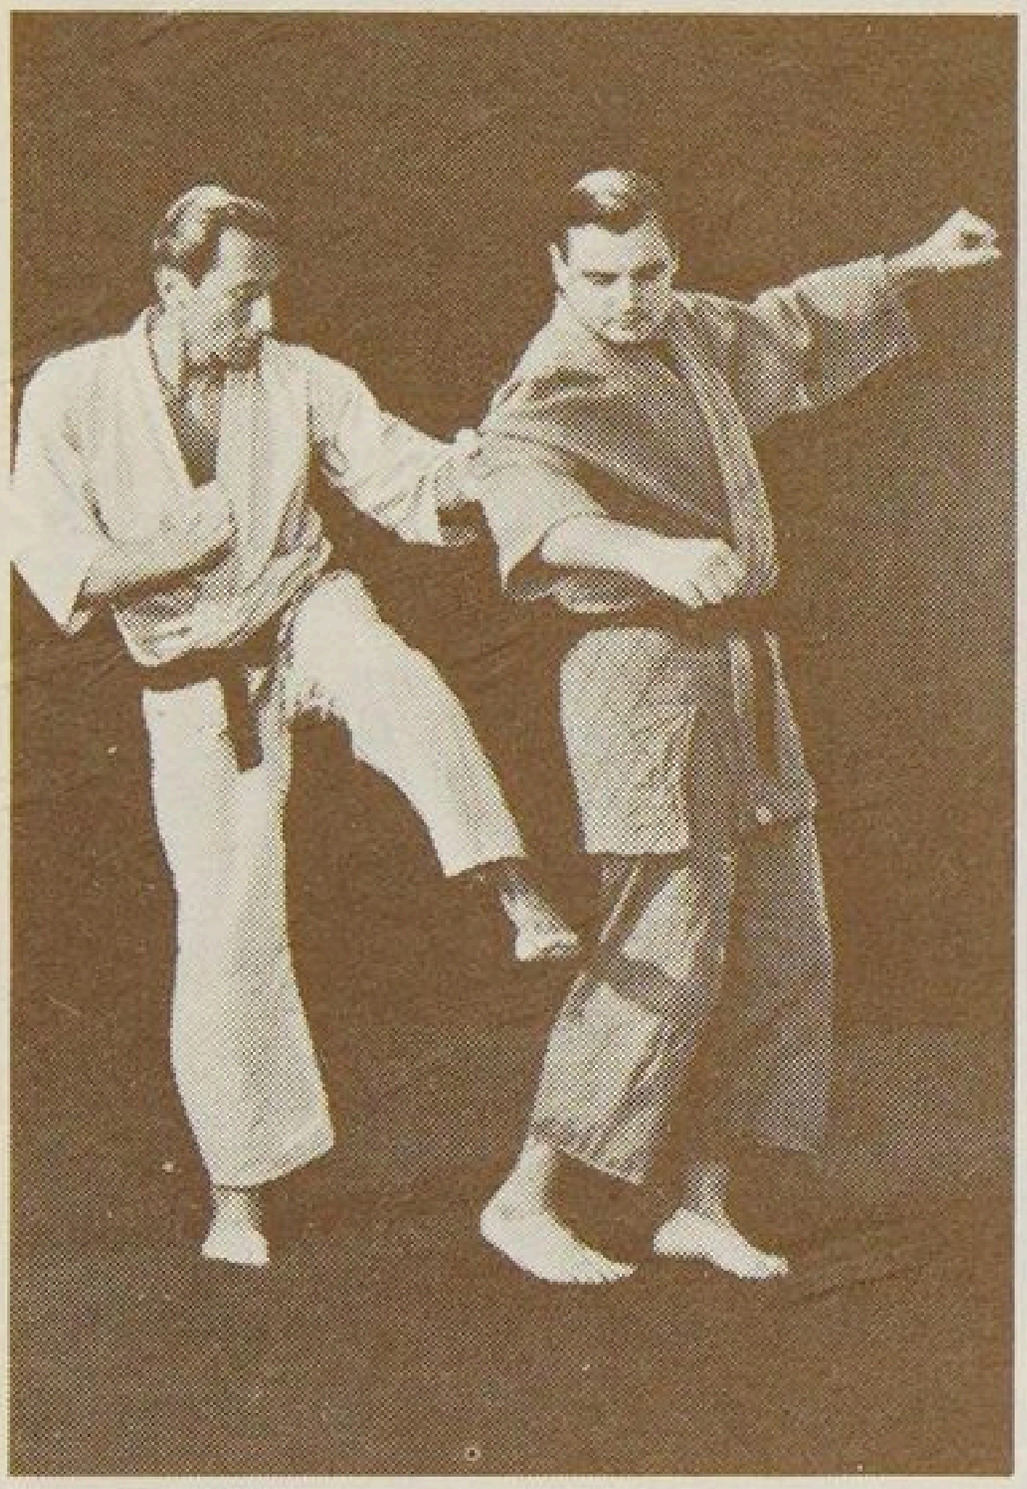
182

183



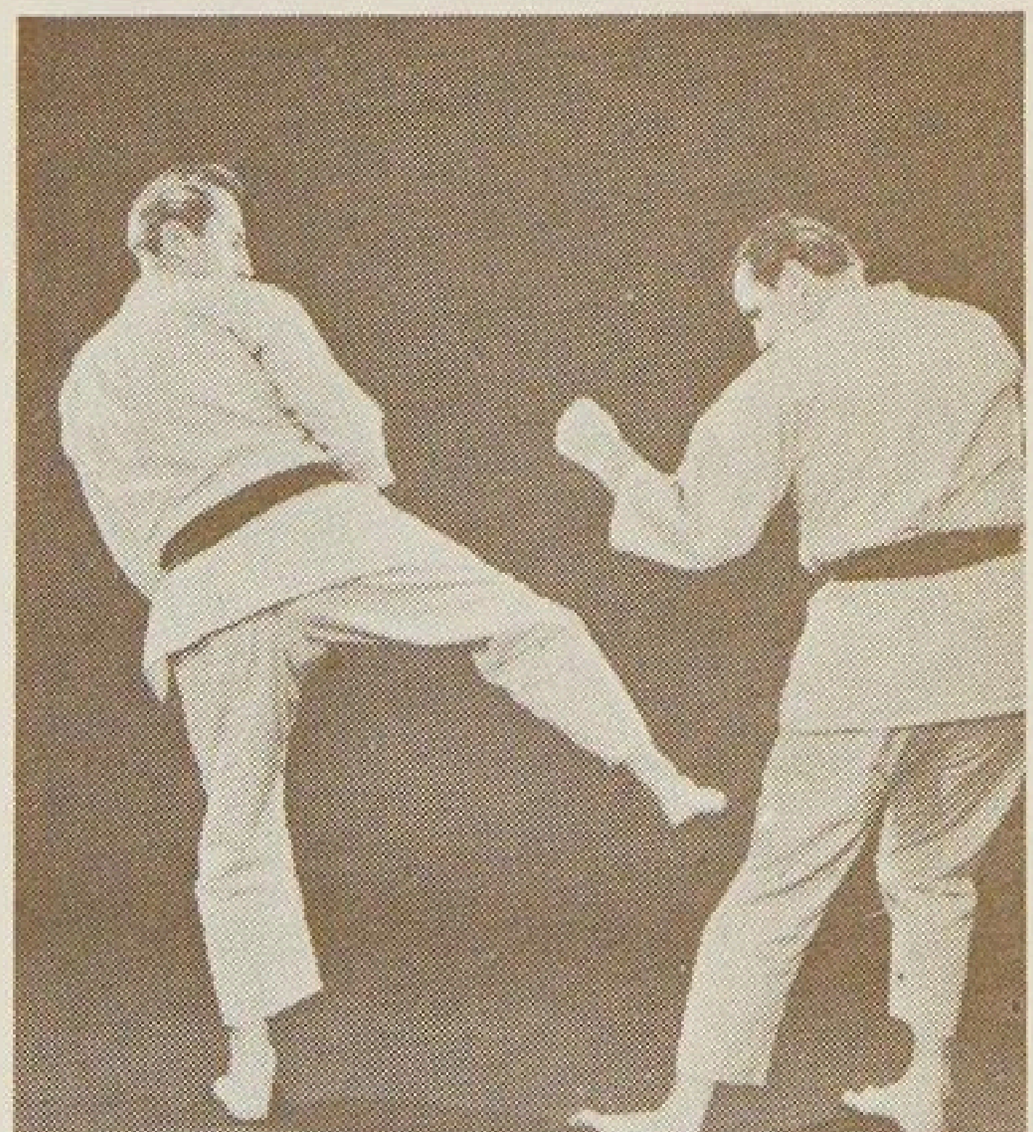
184. As you maintain your grip on him with one hand, kick into the back of his knee with vigor.
185. Then, pulling back on his shoulders with both hands, kick into the back of his knee and, if necessary, effect a takedown.

184



185

186



On-Coming Fist Attack

186. As right partner threatens fist attack out of arms' length, you duck your upper body out of range and kick into his knee . . .

187. . . . following the first kick with a second one.

188. Slash both his arms whether or not they are in action . . .

189. . . . and continue with several hand and foot blows, alternating them.

190. When he is visibly weakened, turn him around, and continue striking from the rear as necessary. Finish with takedown if required.

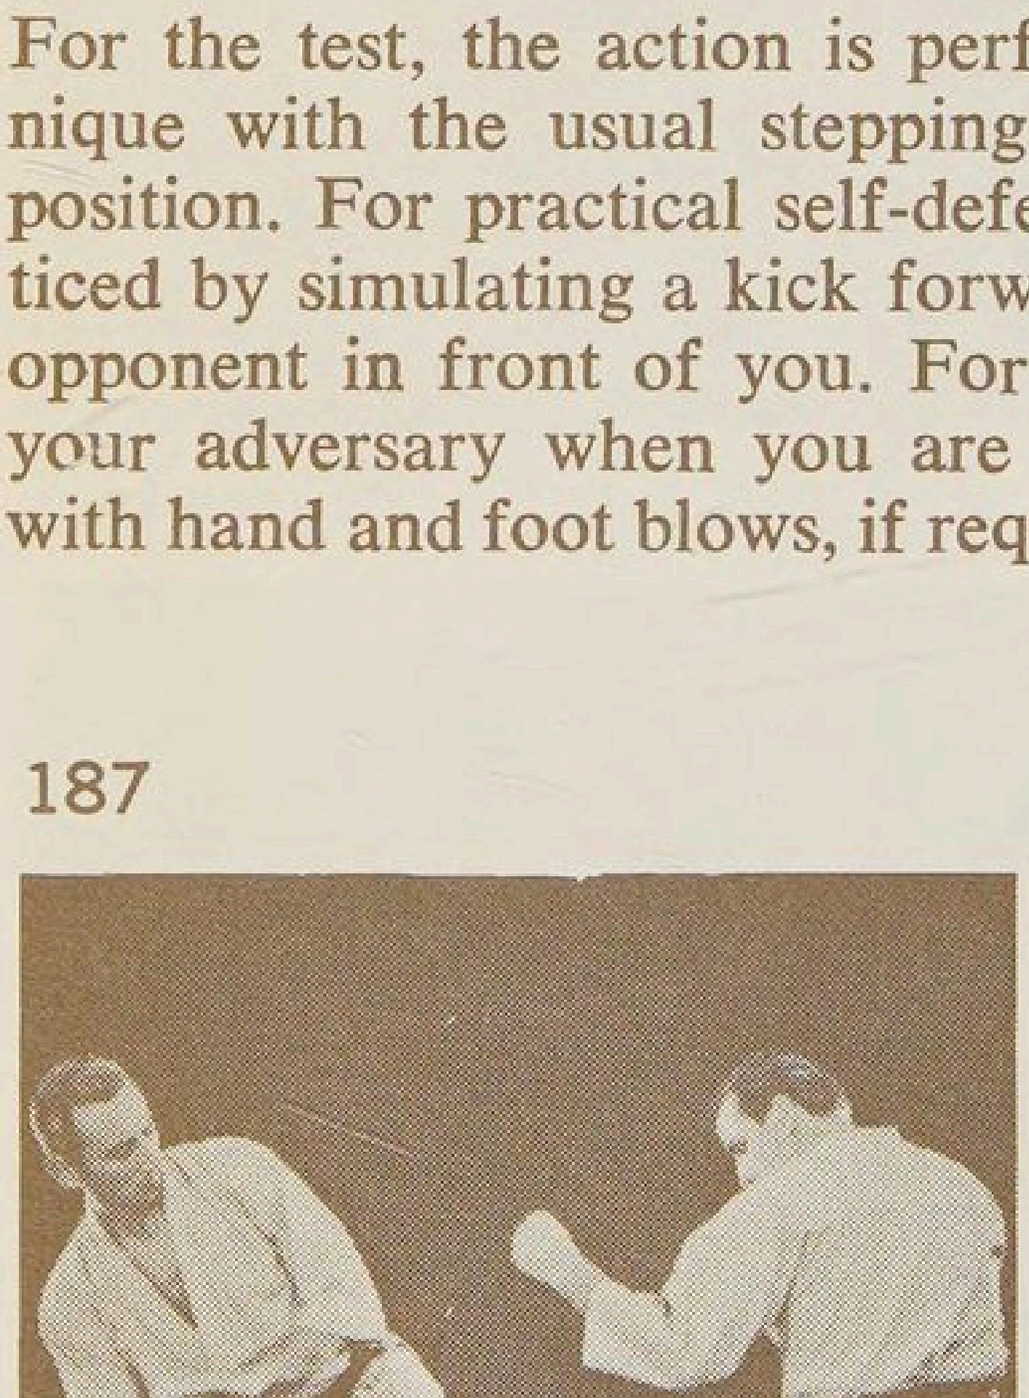
Rear Body Grab — Under Arms

191. Right partner has effected under-arm body grip from behind. Weaken your adversary by slashing into his thigh as you scrape down his shin and stamp on his instep.

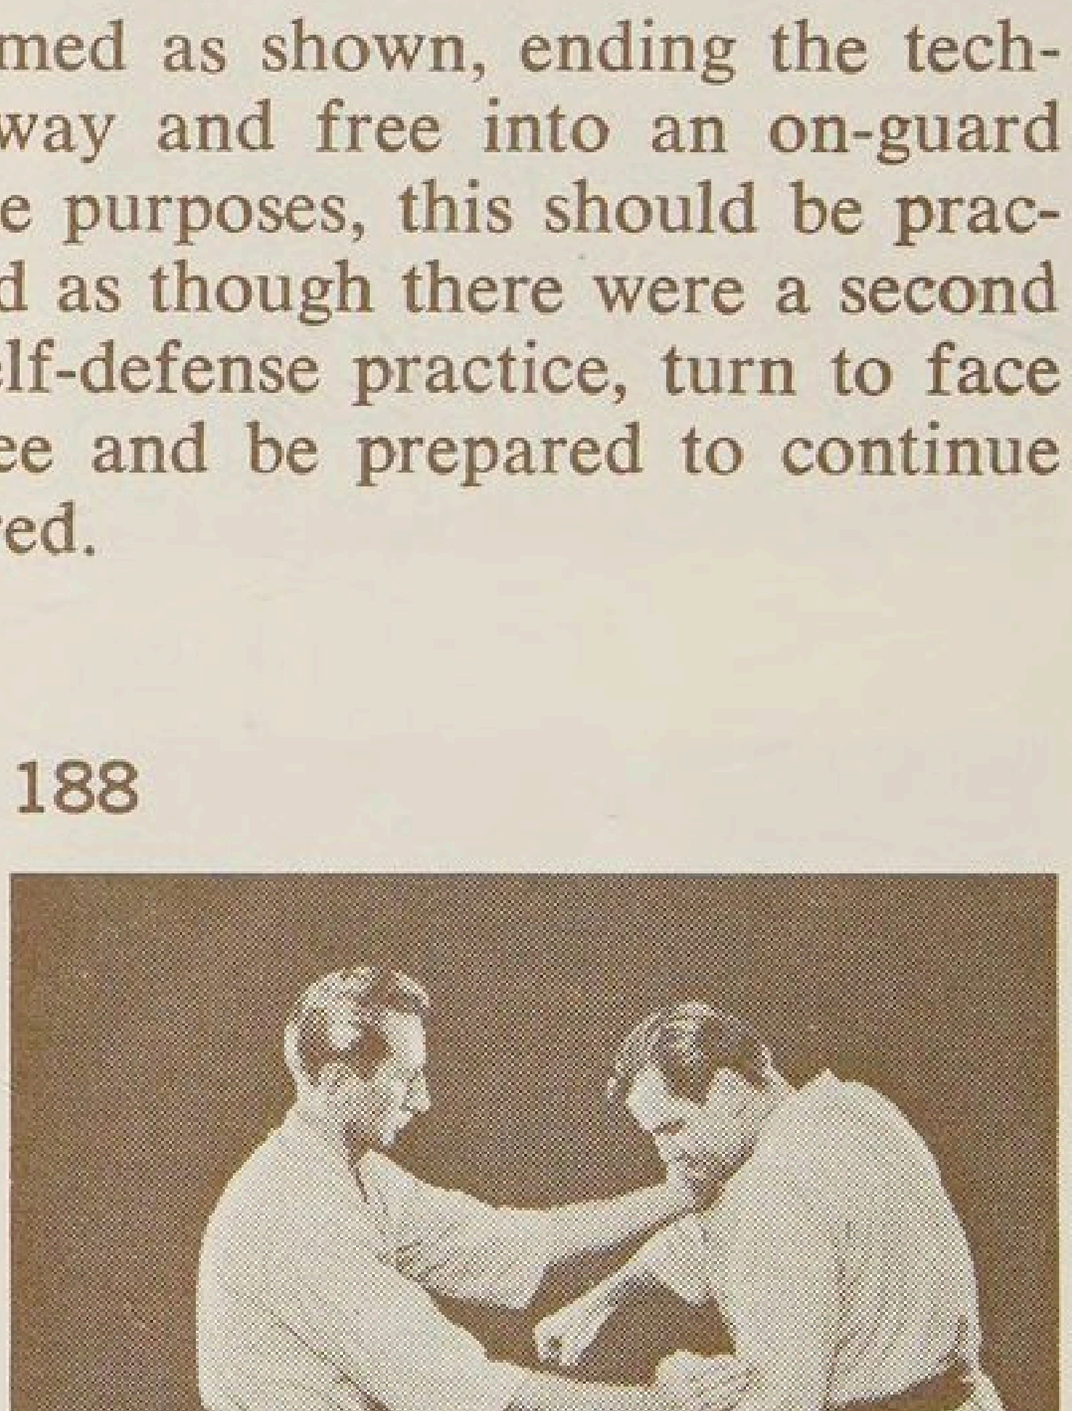
192. When he is weakened, clasp your hands (do not intertwine your fingers), lean forward slightly and hit into his head or face with elbow blows, going from side to side.

For the test, the action is performed as shown, ending the technique with the usual stepping away and free into an on-guard position. For practical self-defense purposes, this should be practiced by simulating a kick forward as though there were a second opponent in front of you. For self-defense practice, turn to face your adversary when you are free and be prepared to continue with hand and foot blows, if required.

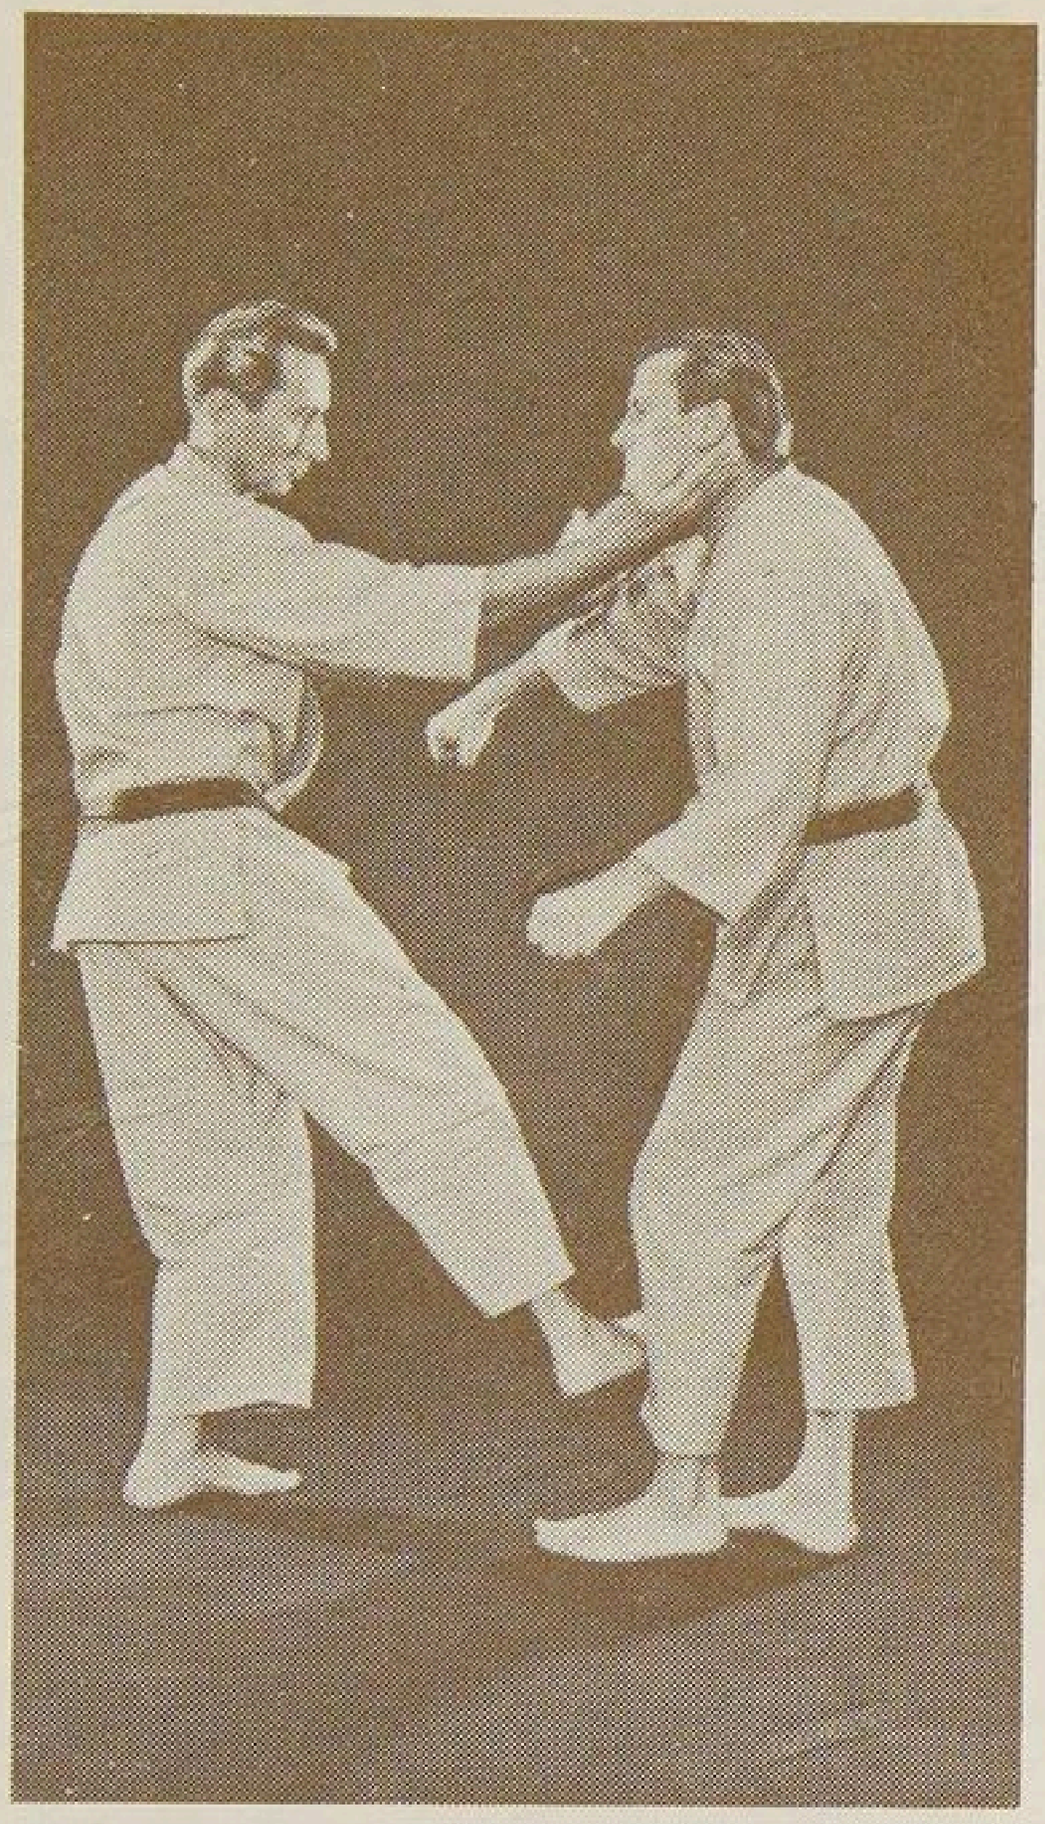
187



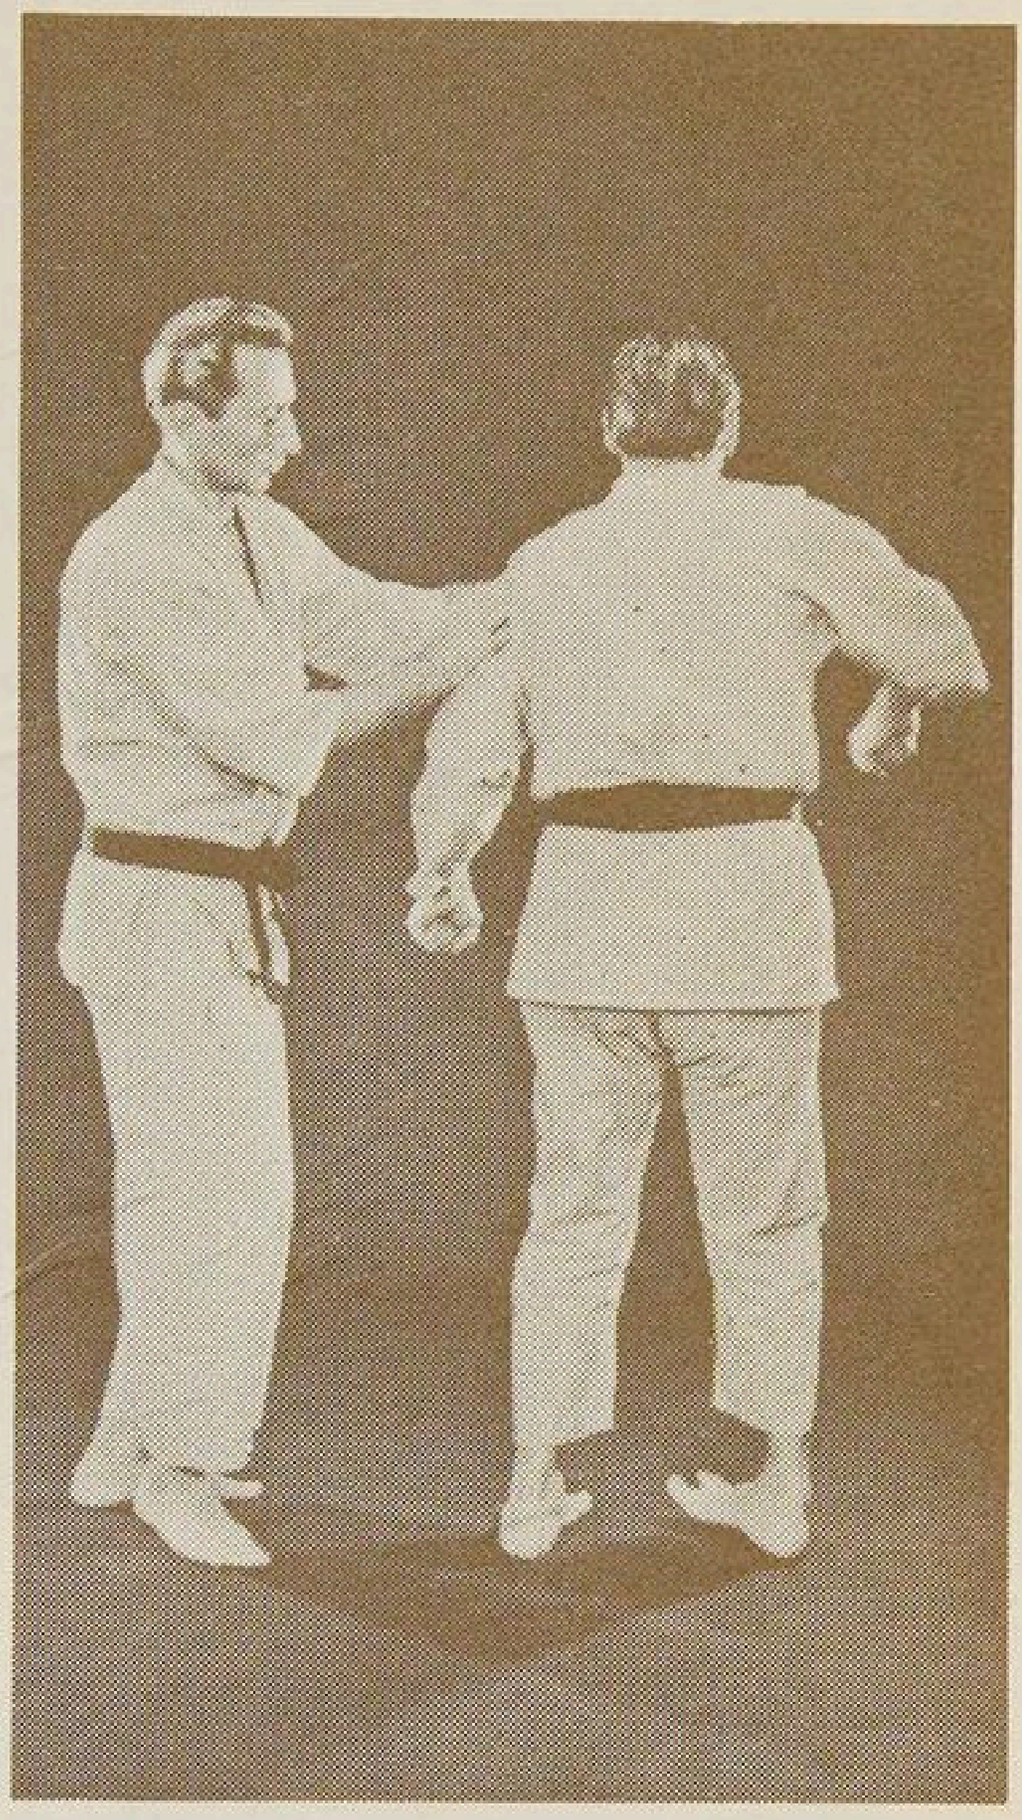
188



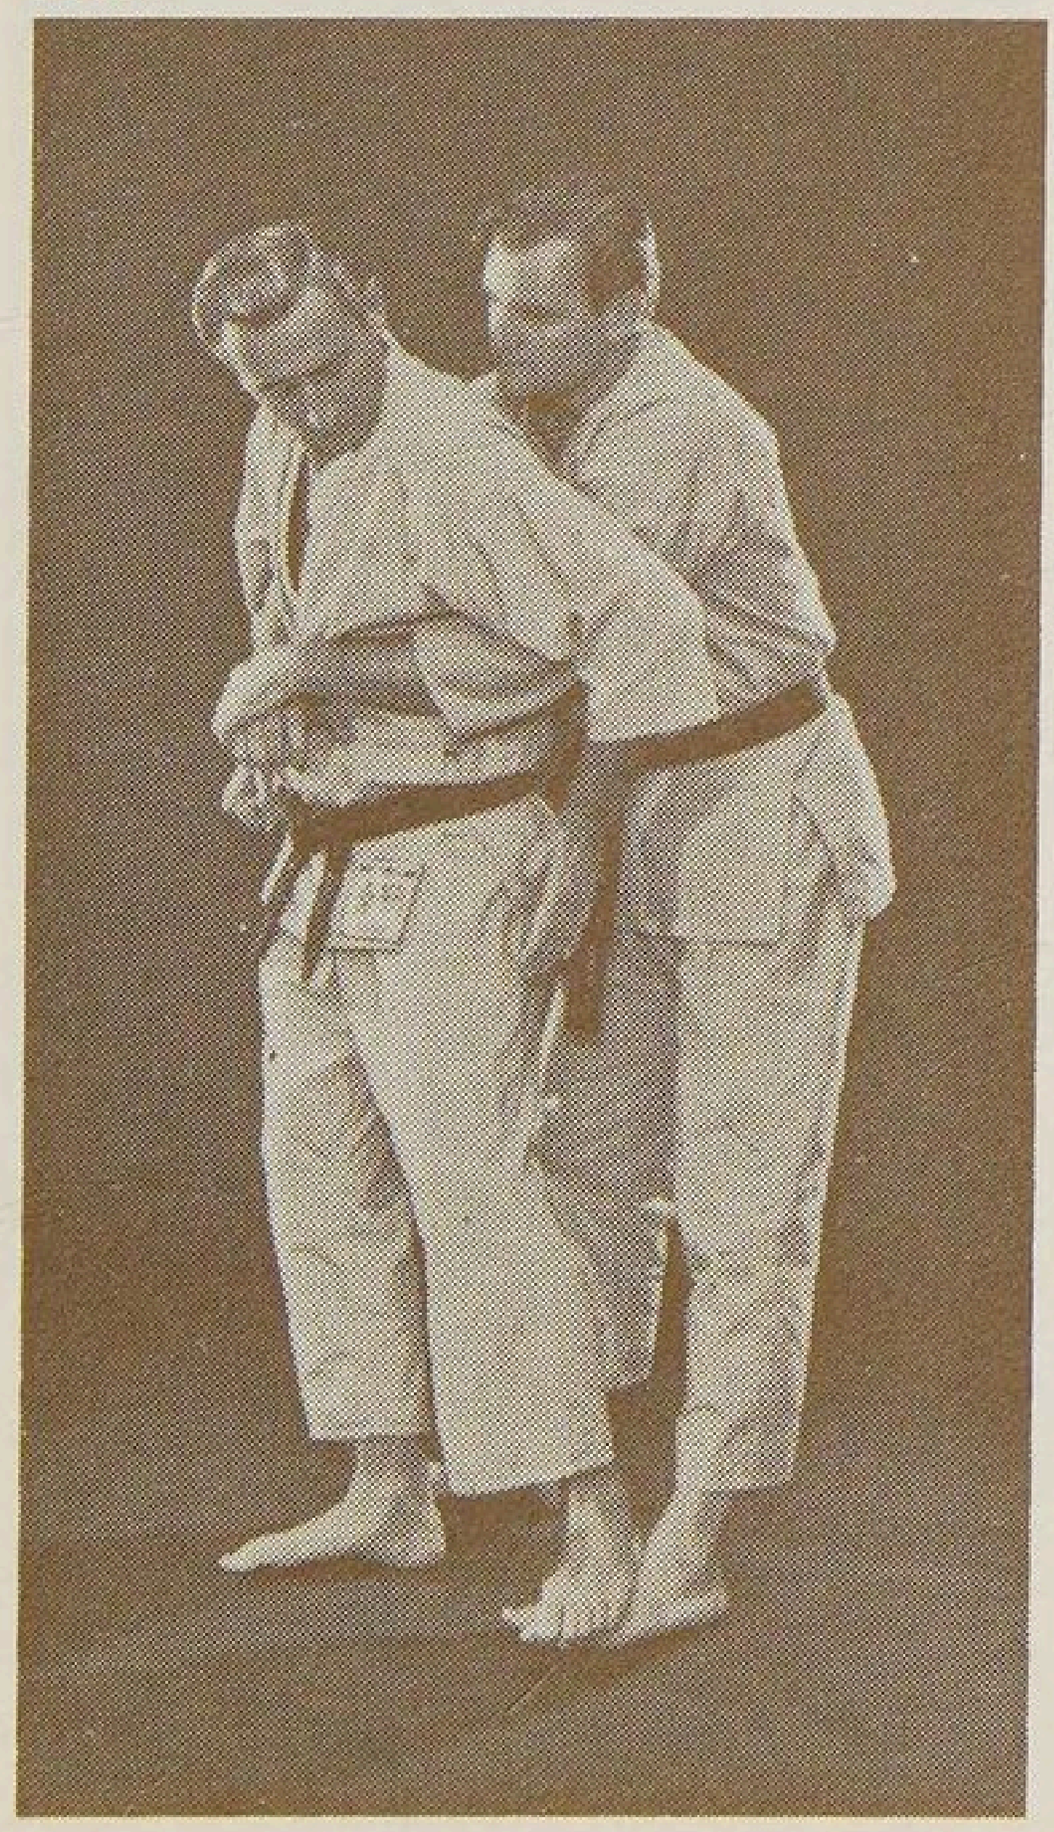
189



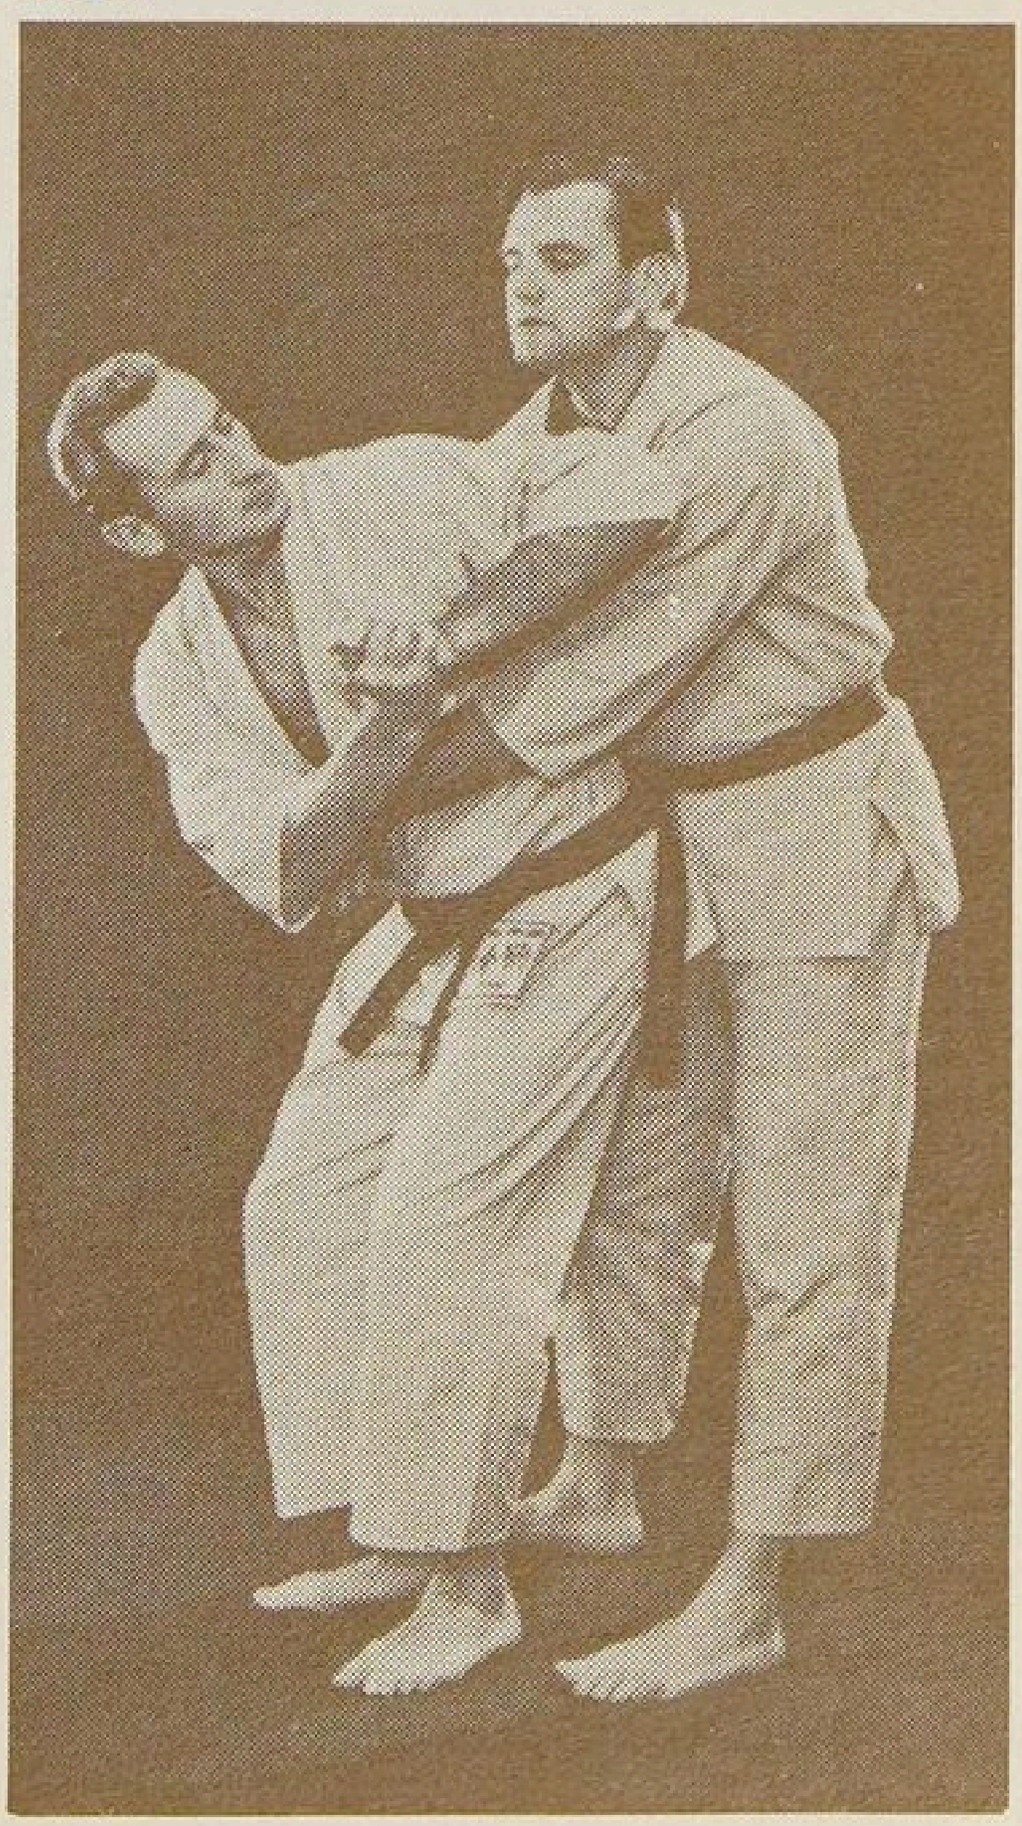
190



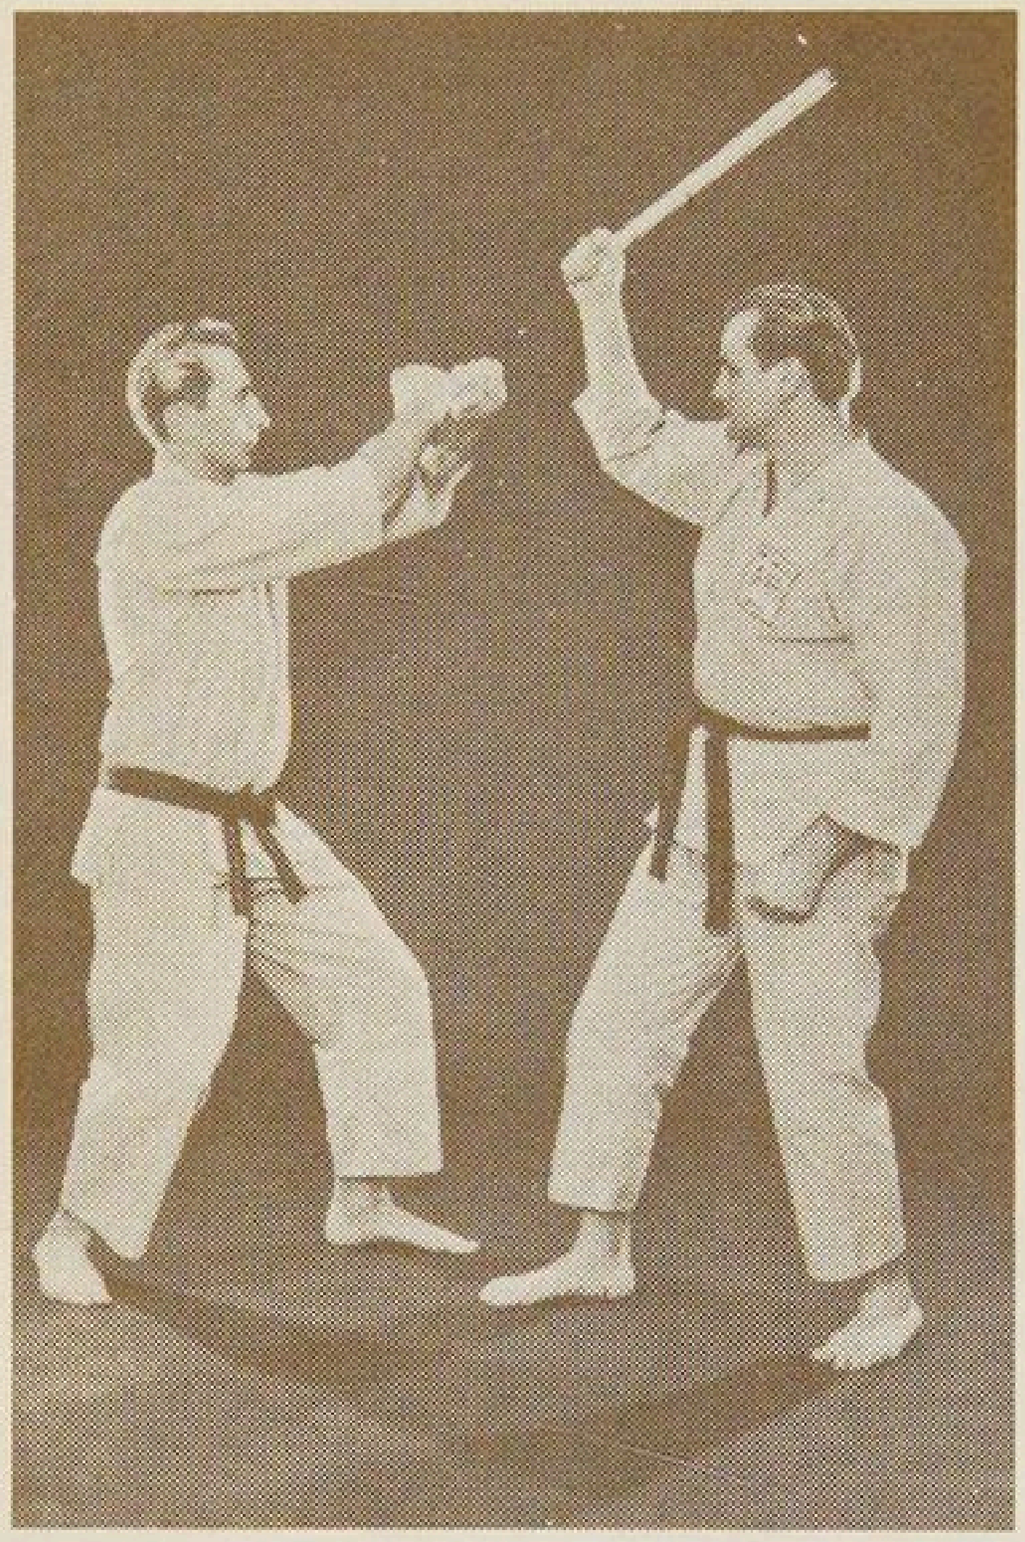
191



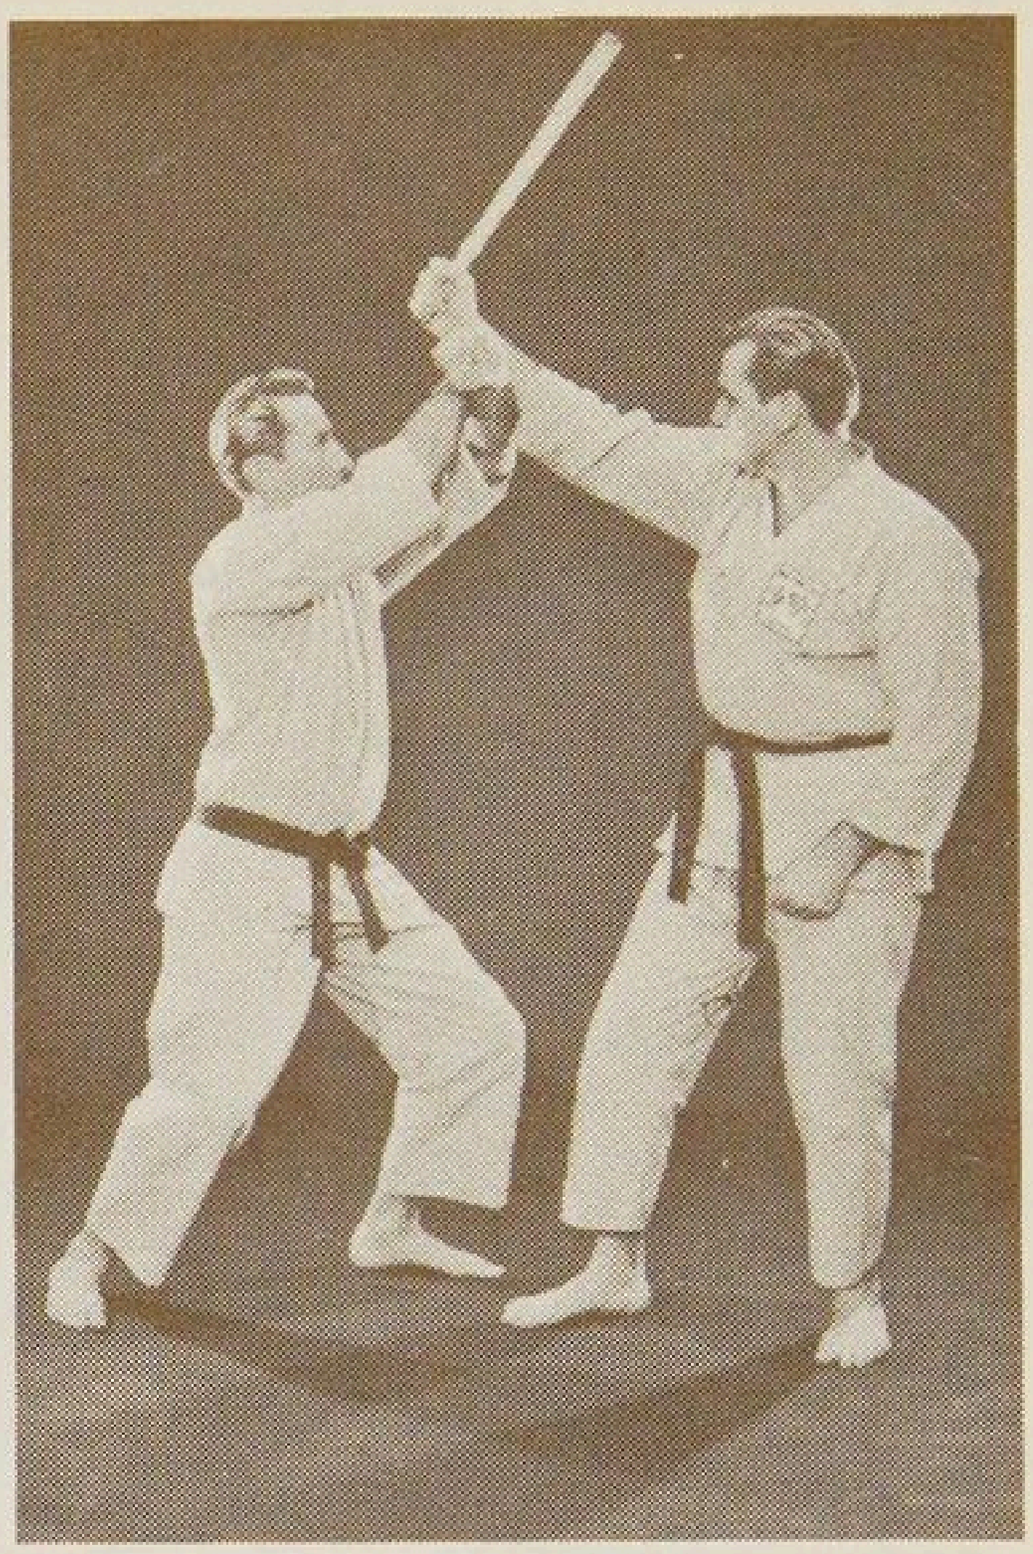
192



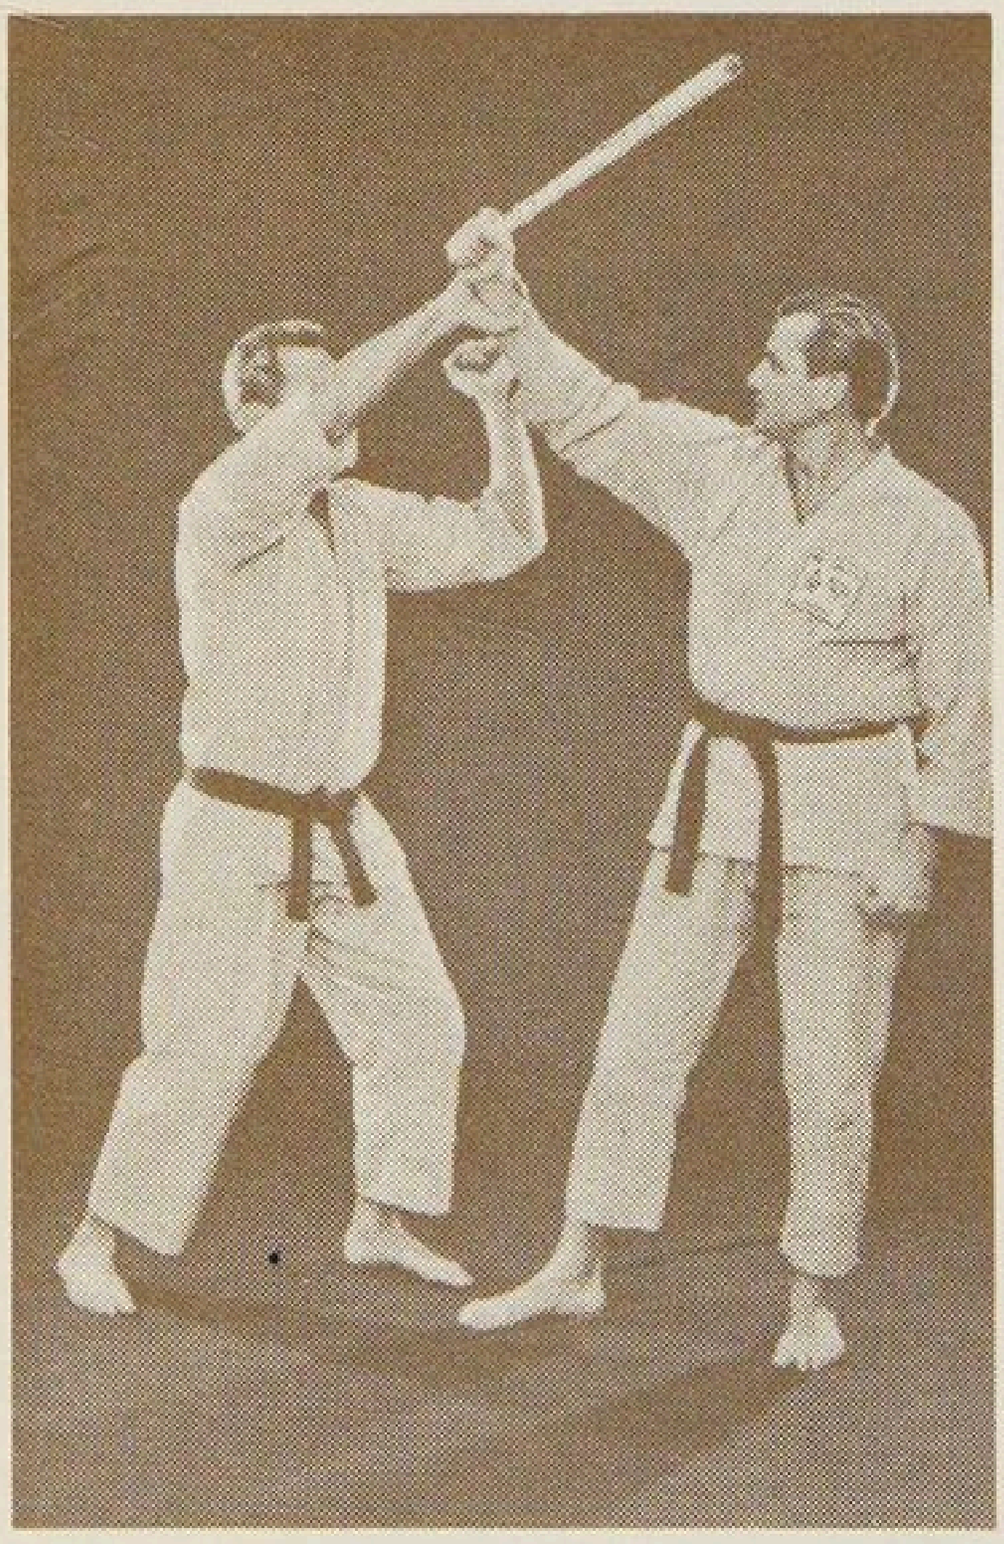
193



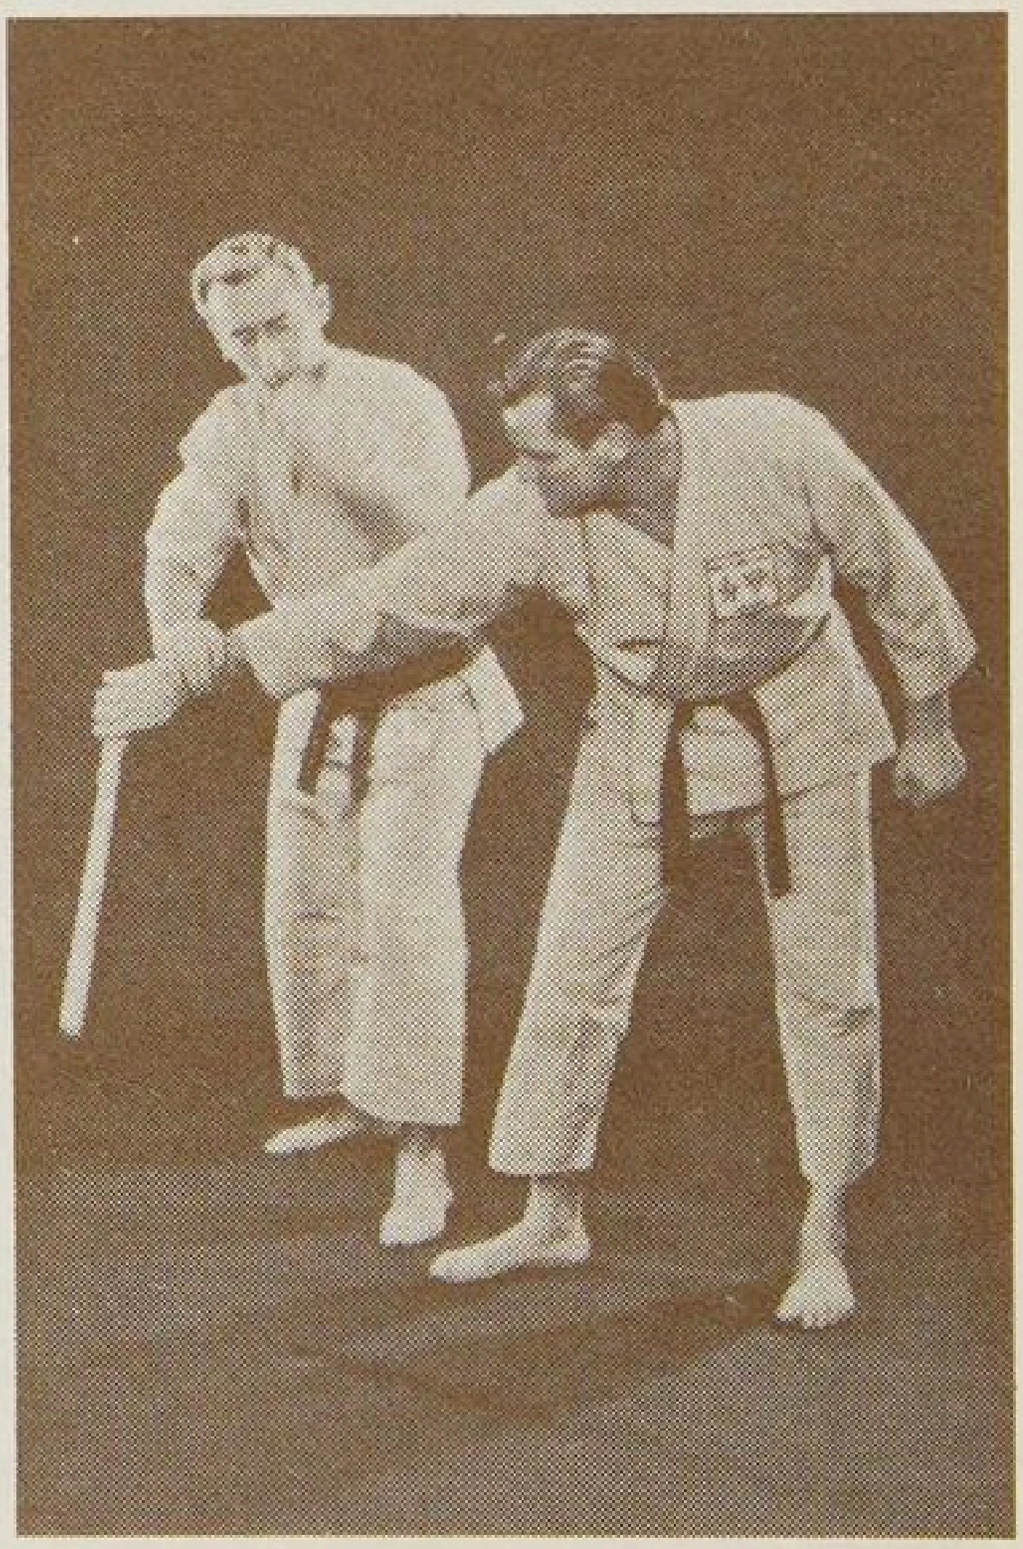
194



195



196



Club (or Stick) Defense: Over-Head Attack

193, 194. As right partner comes in with a high, over-head stick attack, cross your arms at the wrist, step in deep, and block his hitting arm at the wrist. (This is one of the very few instances where I teach stepping *into* an oncoming attack. Because the stick

or club is an extension of the arm, stepping away from the attack is not usually safe, whereas stepping in and under the weapon is relatively safe.)

195, 196. Grip his wrist and apply the basic arm bar.

For the test, stop at this point and step away into on-guard position. For practical self-defense you may need to continue with additional hand and foot blows.

Knife Attack: Defense Against Straight-In Thrust

Before practicing defenses against weapons, reread the material "An Armed Assailant: When to Defend."

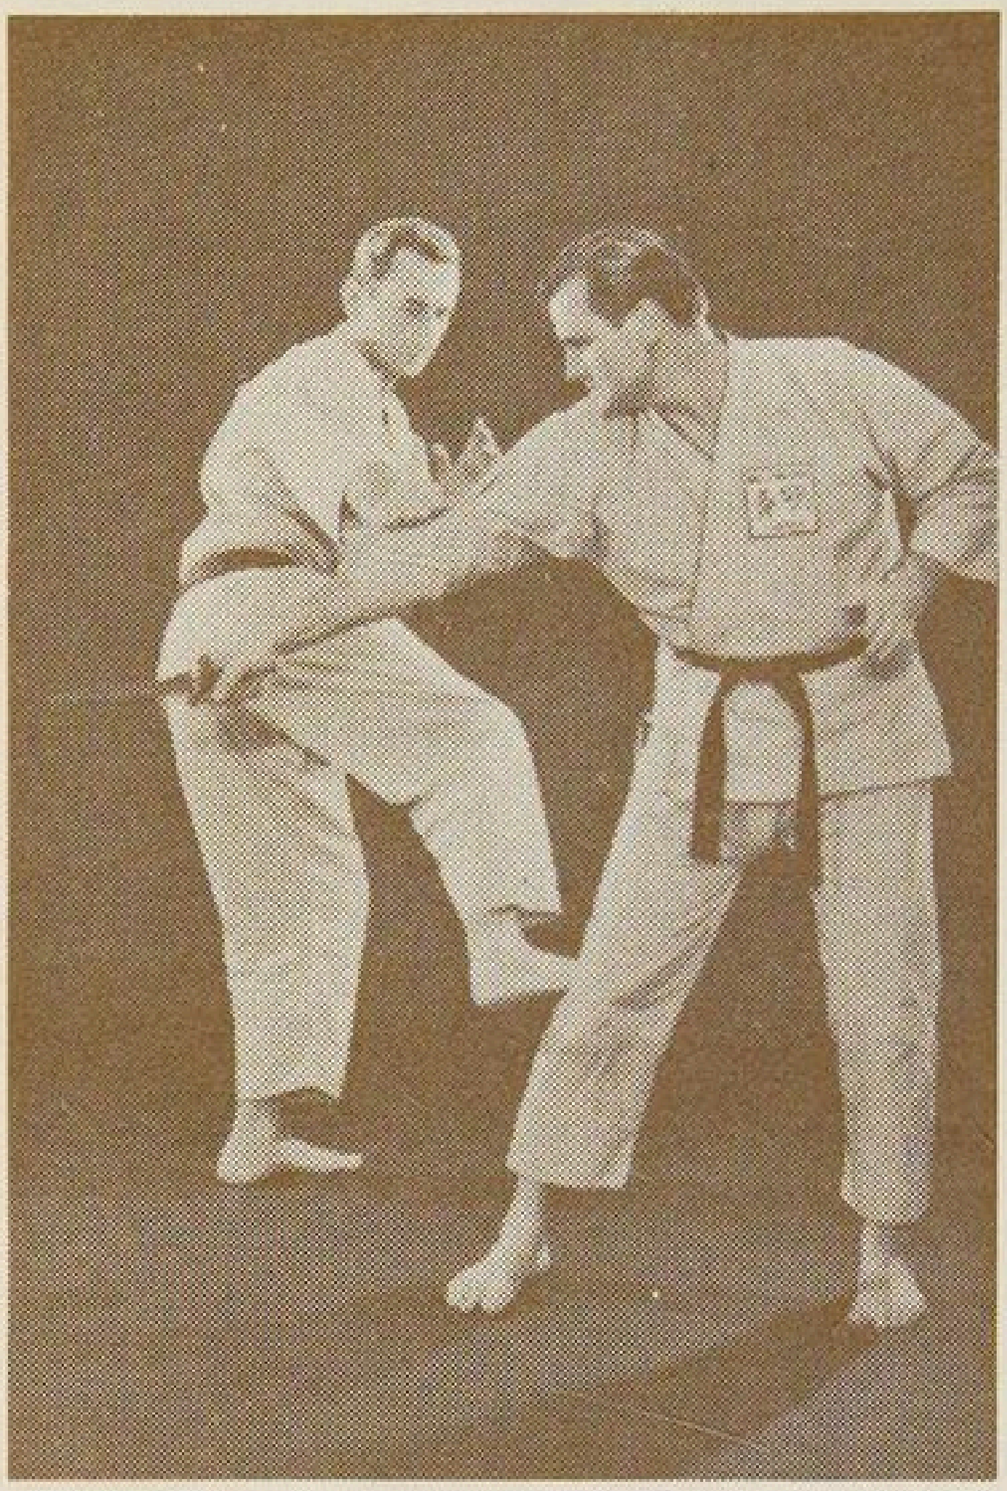
197. As partner shown right simulates threat of knife attack, you evaluate his method of attack. If the attacker (on the street) does not show by his stance and way of holding the knife what type of attack he will make, if there is the opportunity in place or space, you can draw him out to reveal his planned attack by making one leap backward.

198. As he thrusts forward, leap to the outside of the attacking knife hand . . .

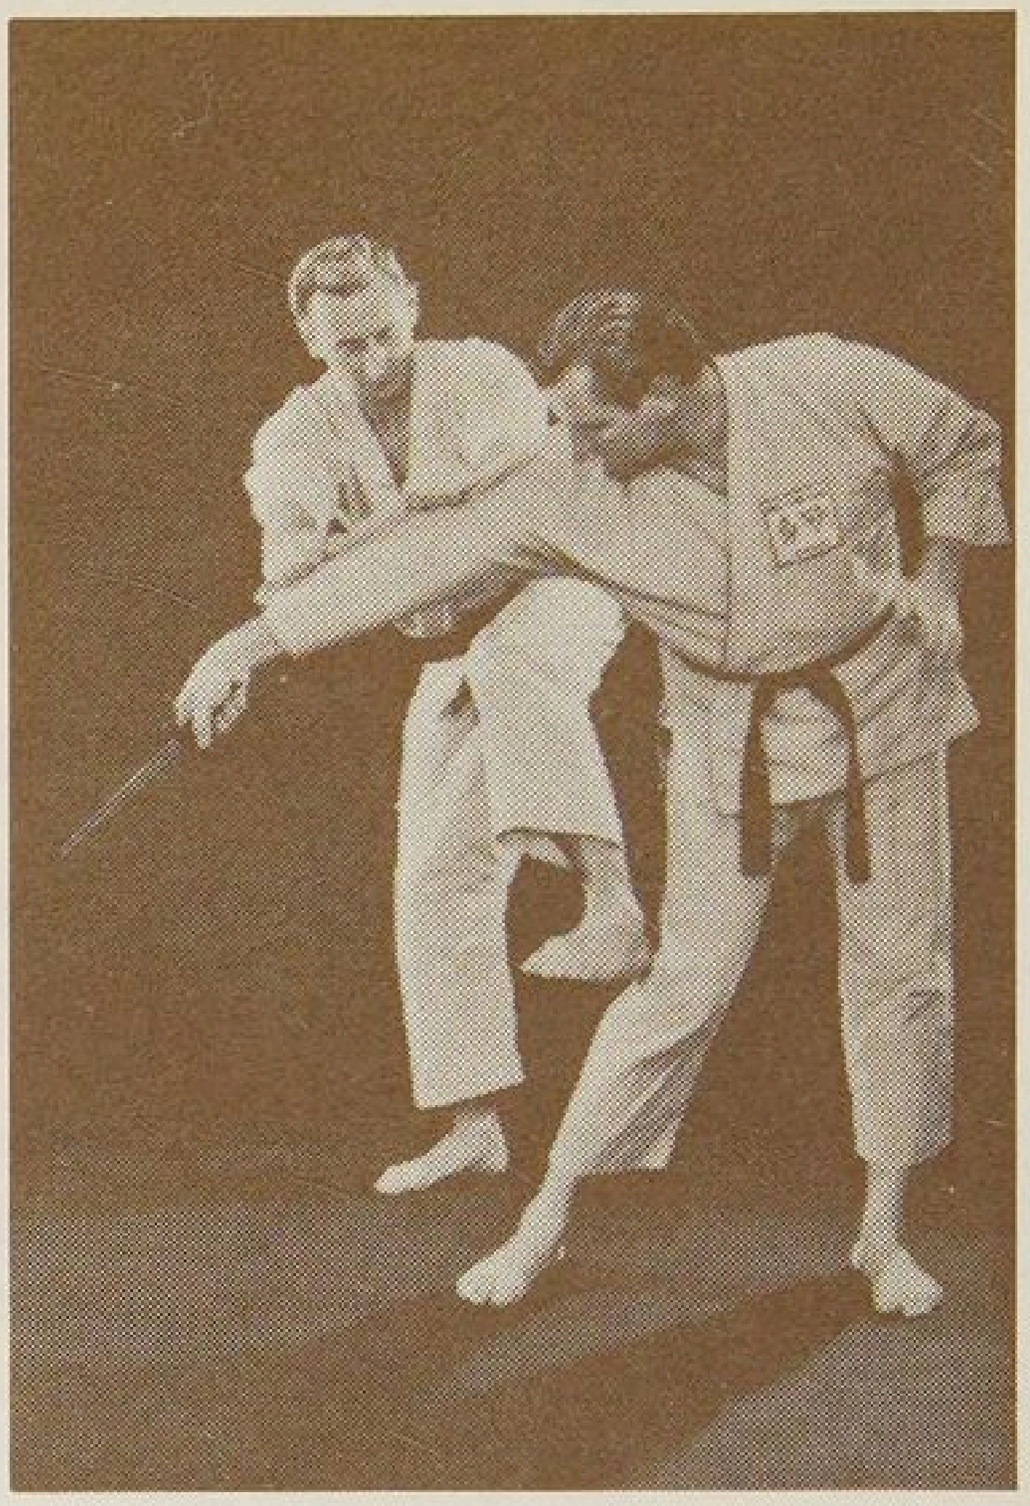
197

198

199



200



199. . . . and immediately kick into his knee. Then grip cloth at his arm and . . .

200. . . . follow the first kick with additional forceful kicks; grip his arm with both your hands, holding him away from you.

For the test, you will then step back into on-guard stance. For practical self-defense, you will continue to kick with vigor until he is on the ground or drops the knife. Do not attempt to disarm him while his hold on the weapon is firm.

Your understanding of when to defend against weapon attacks is as important as your knowledge of how to make such defenses effective.

SURPRISE ATTACK: TRAINING FOR RESPONSE AND DEFENSE

Front Surprise Attack

Few attacks are completely without some forewarning. Ordinarily there is *some* hint of danger to which you can train yourself to respond appropriately. You should also be able to respond quickly to surprise attack. You will have to let your common sense guide you in this matter; since there are places and times in which attacks are more likely than others, you need not go about sensing possibility of danger at a church picnic in the same way that you would be alert in a dark alley.

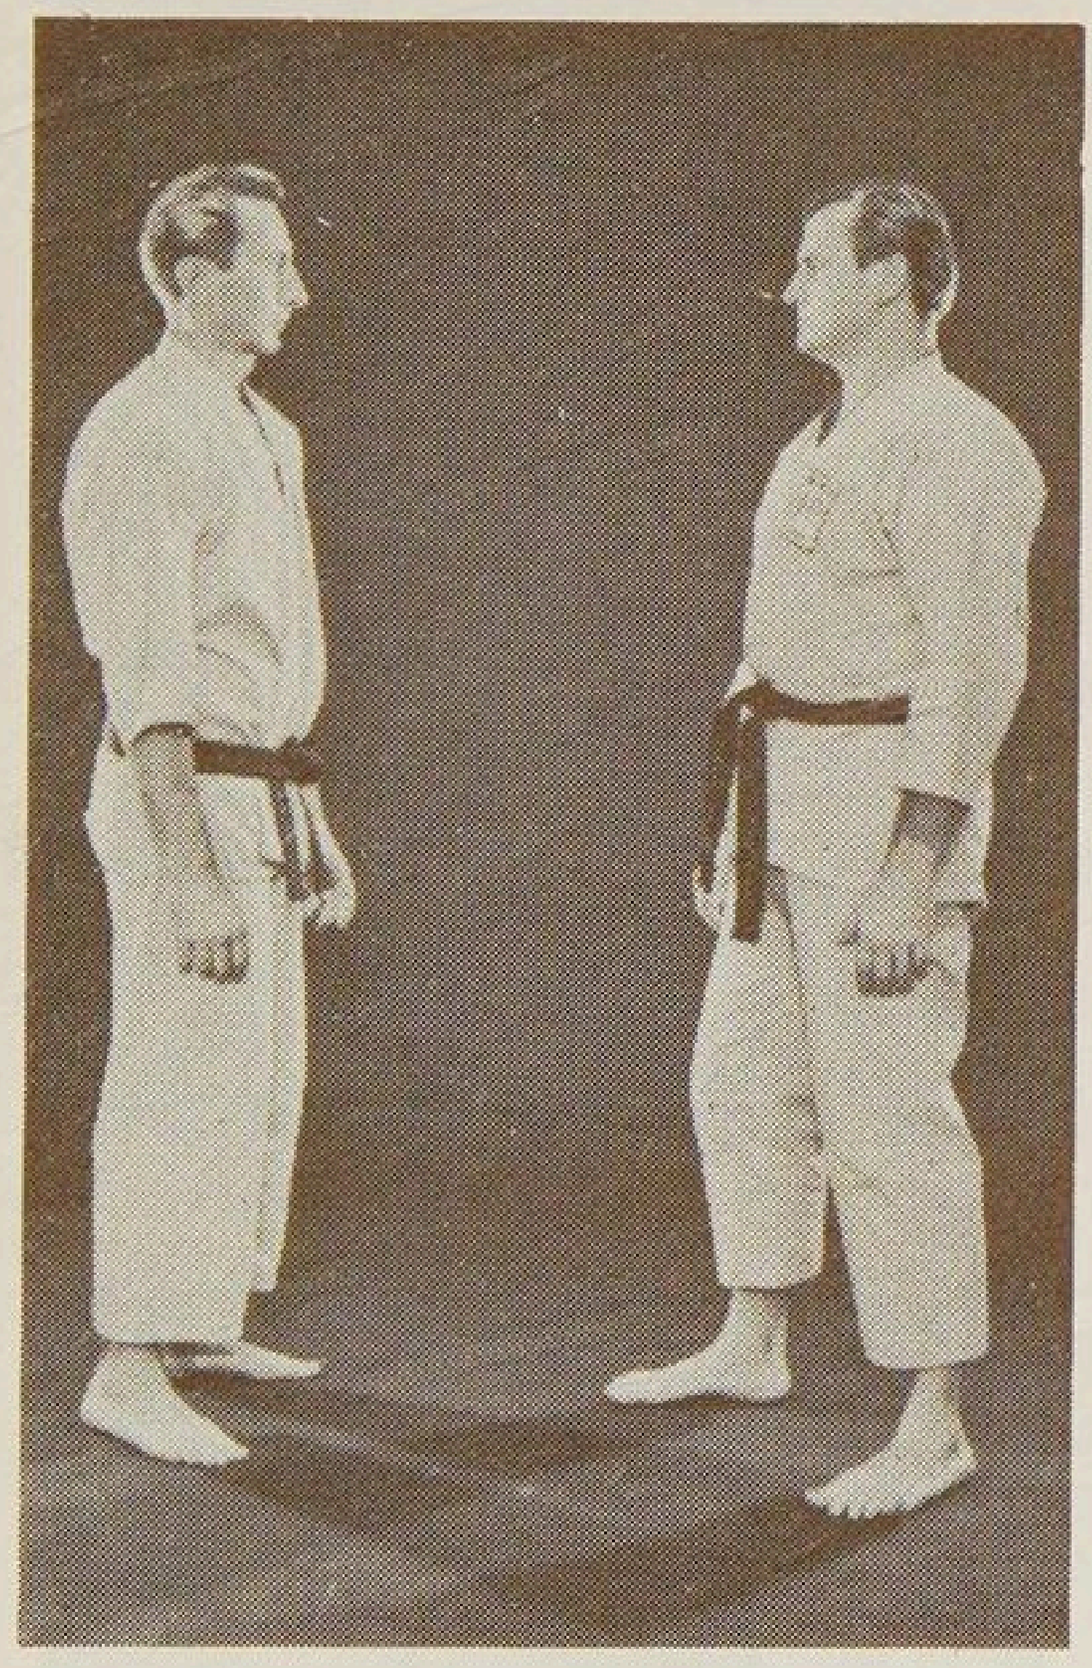
The training procedure here is intended to develop your quickness of response to sudden movements which are potentially aggressive.

201. Partners stand facing.

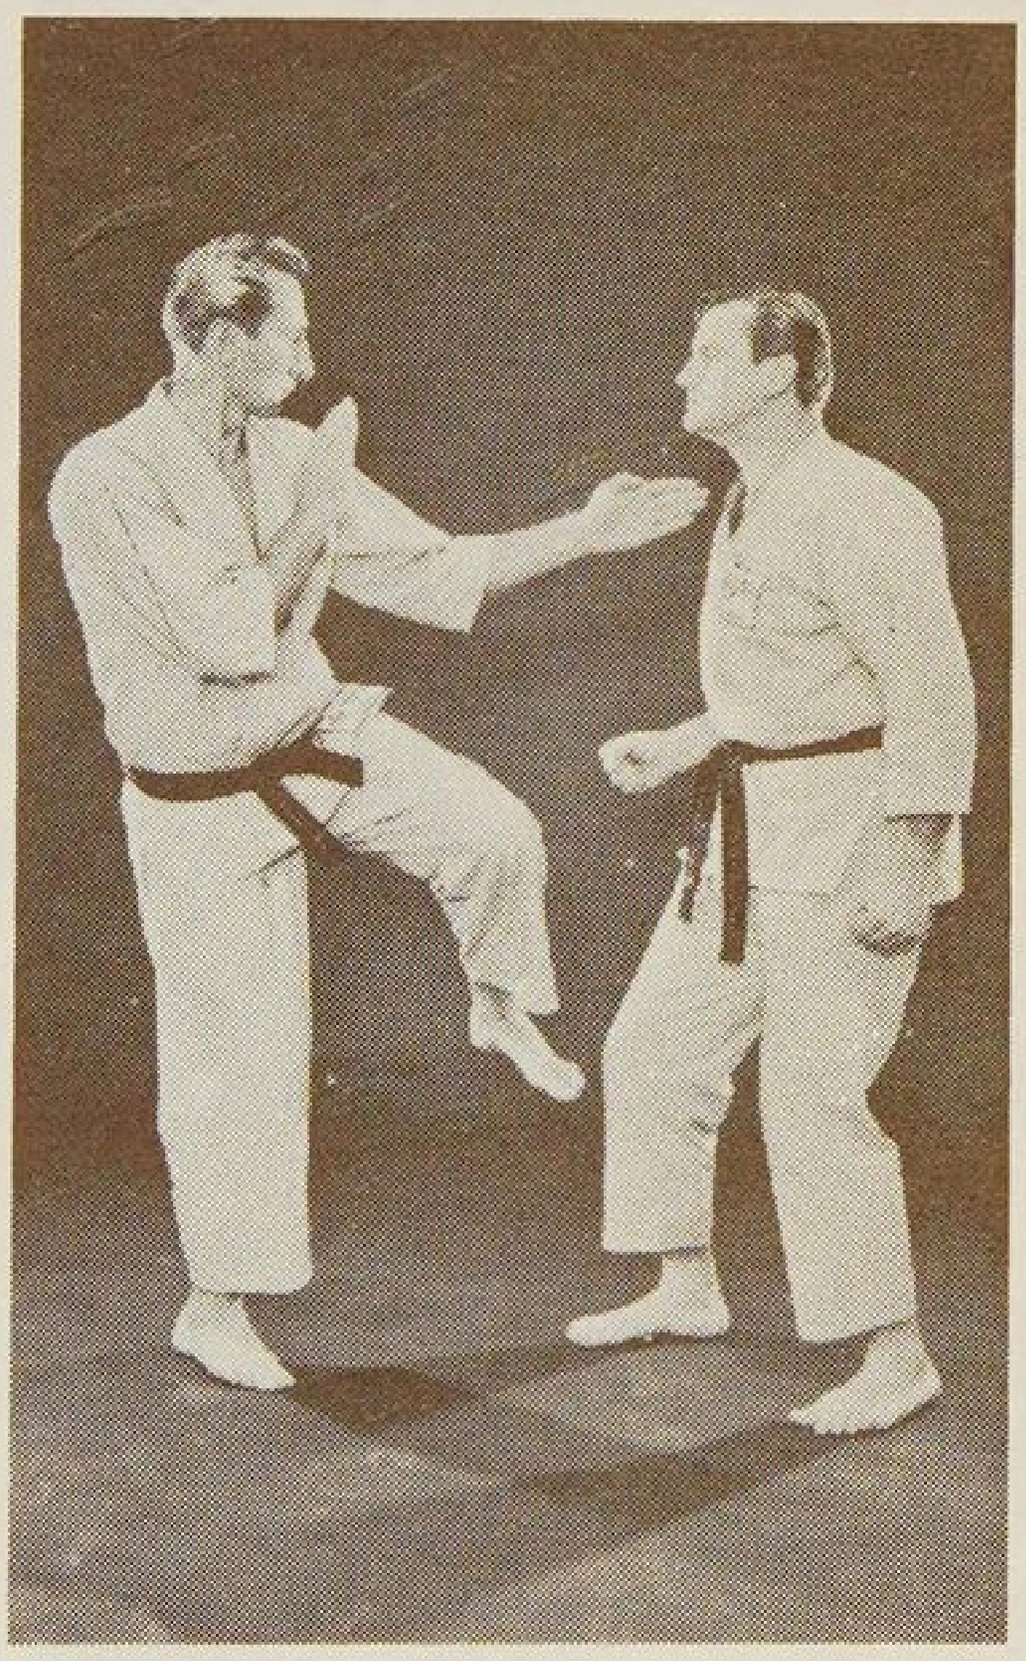
202. Without cue, partner at right makes aggressive movement; you respond with triple action: simultaneous hand and foot blows as your hand comes up into high guard. This is followed by a second set of simultaneous hand and foot blows.

For the test, you then step away into on-guard position.

201



202



Rear Surprise Attack

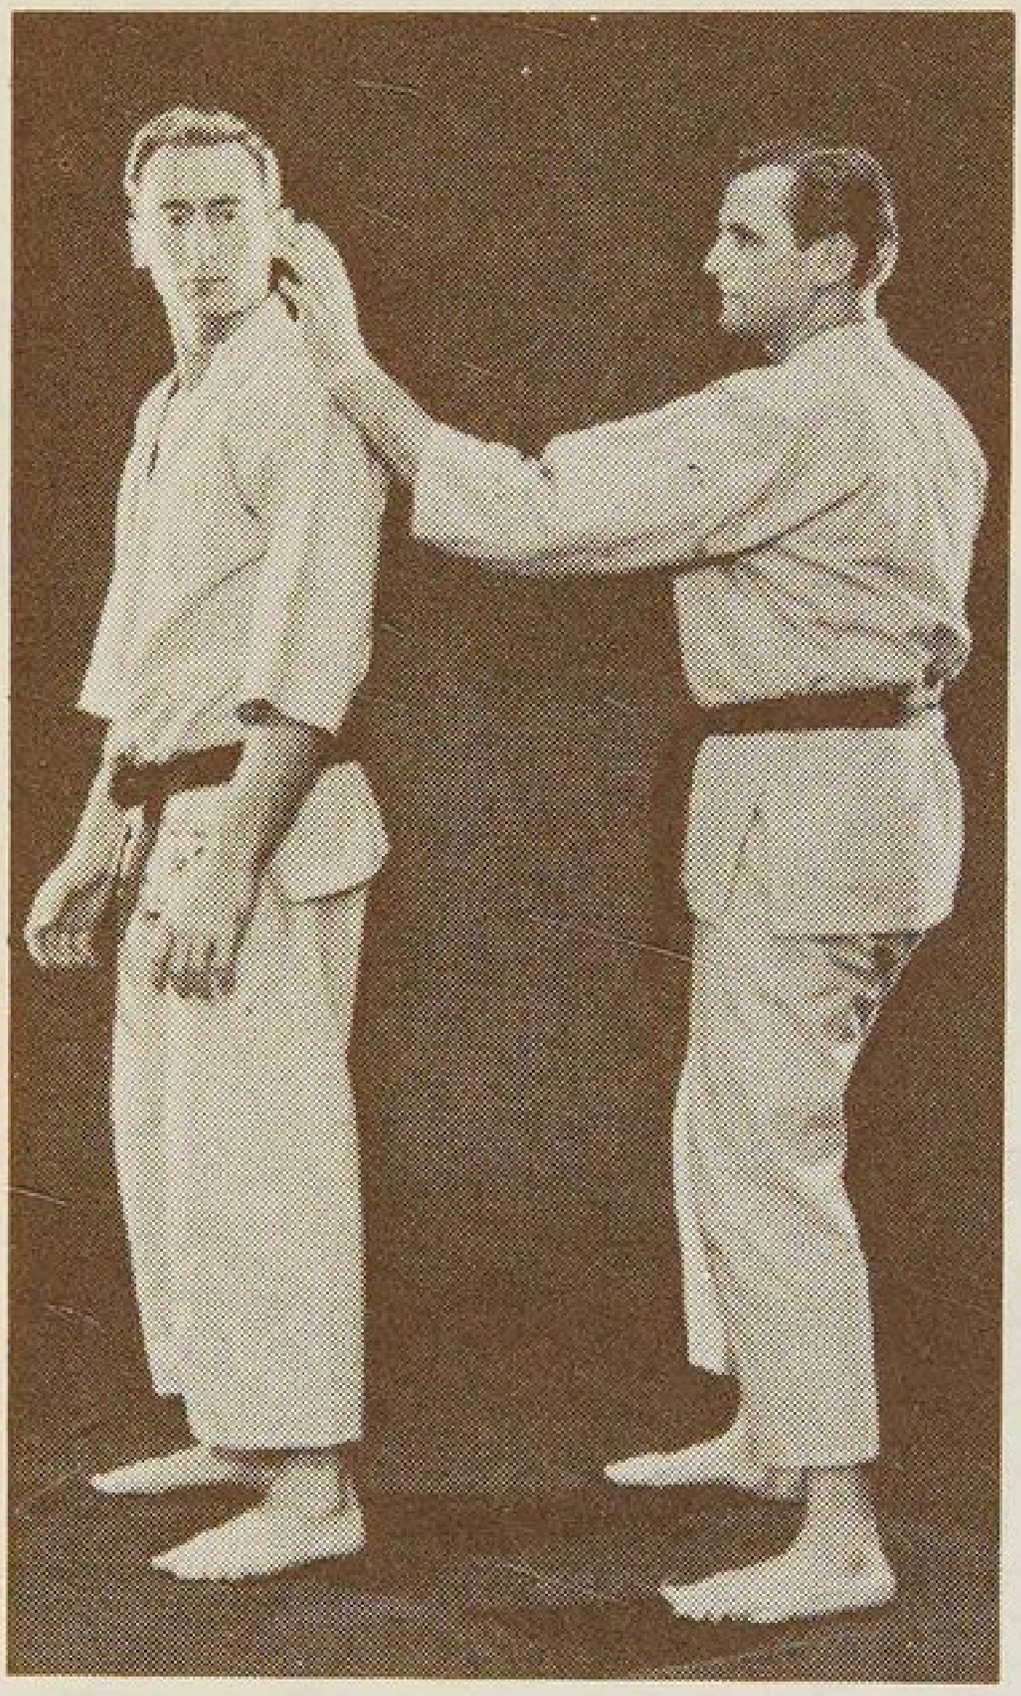
Training for alertness and response is based on three types of clues: You can be alert for sounds (shuffling, steps, breathing, cloth moving) or sight (shadows, peripheral vision, reflections) or touch (grazing or very slight touch).

Training for response to rear attack must include the act of looking around *as you begin* your defense in all cases. It is safer and more prudent to see what is actually happening and this will train you to avoid striking out at people who have absolutely no aggressive intent.

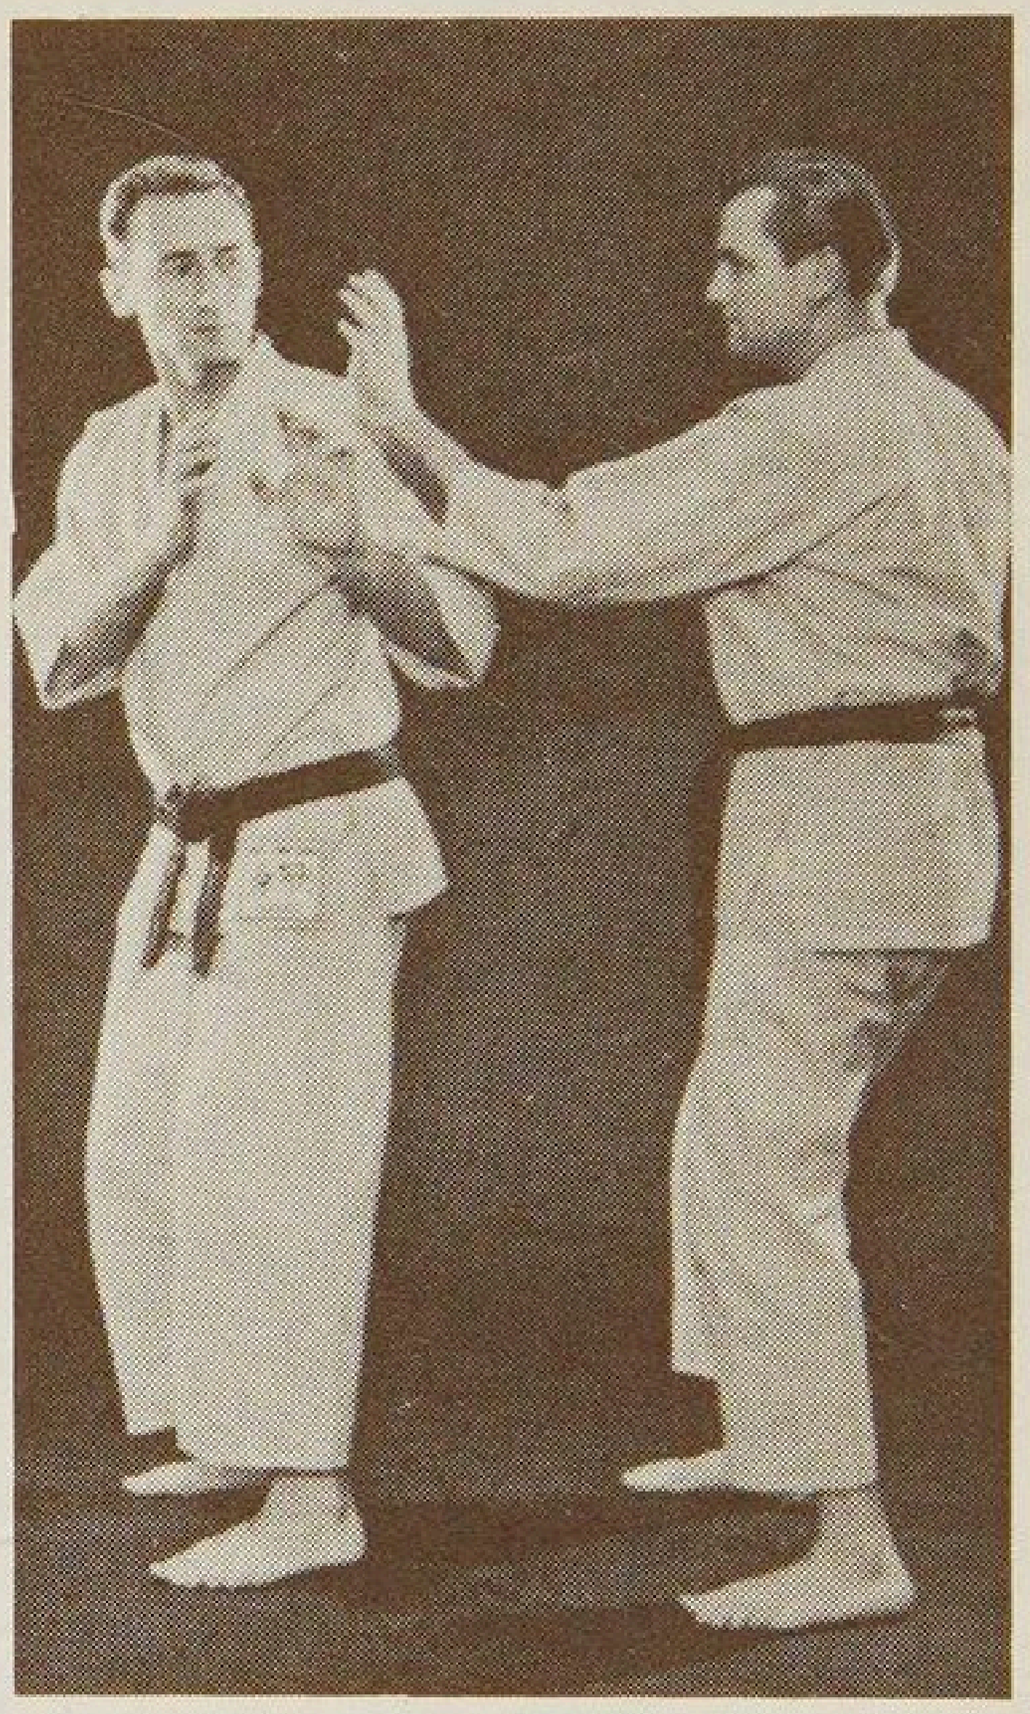
203, 204. The instant you detect the presence of someone behind you, turn and begin the blocking action shown.

205. If it is an attack, step away from the adversary and begin kicking defense.

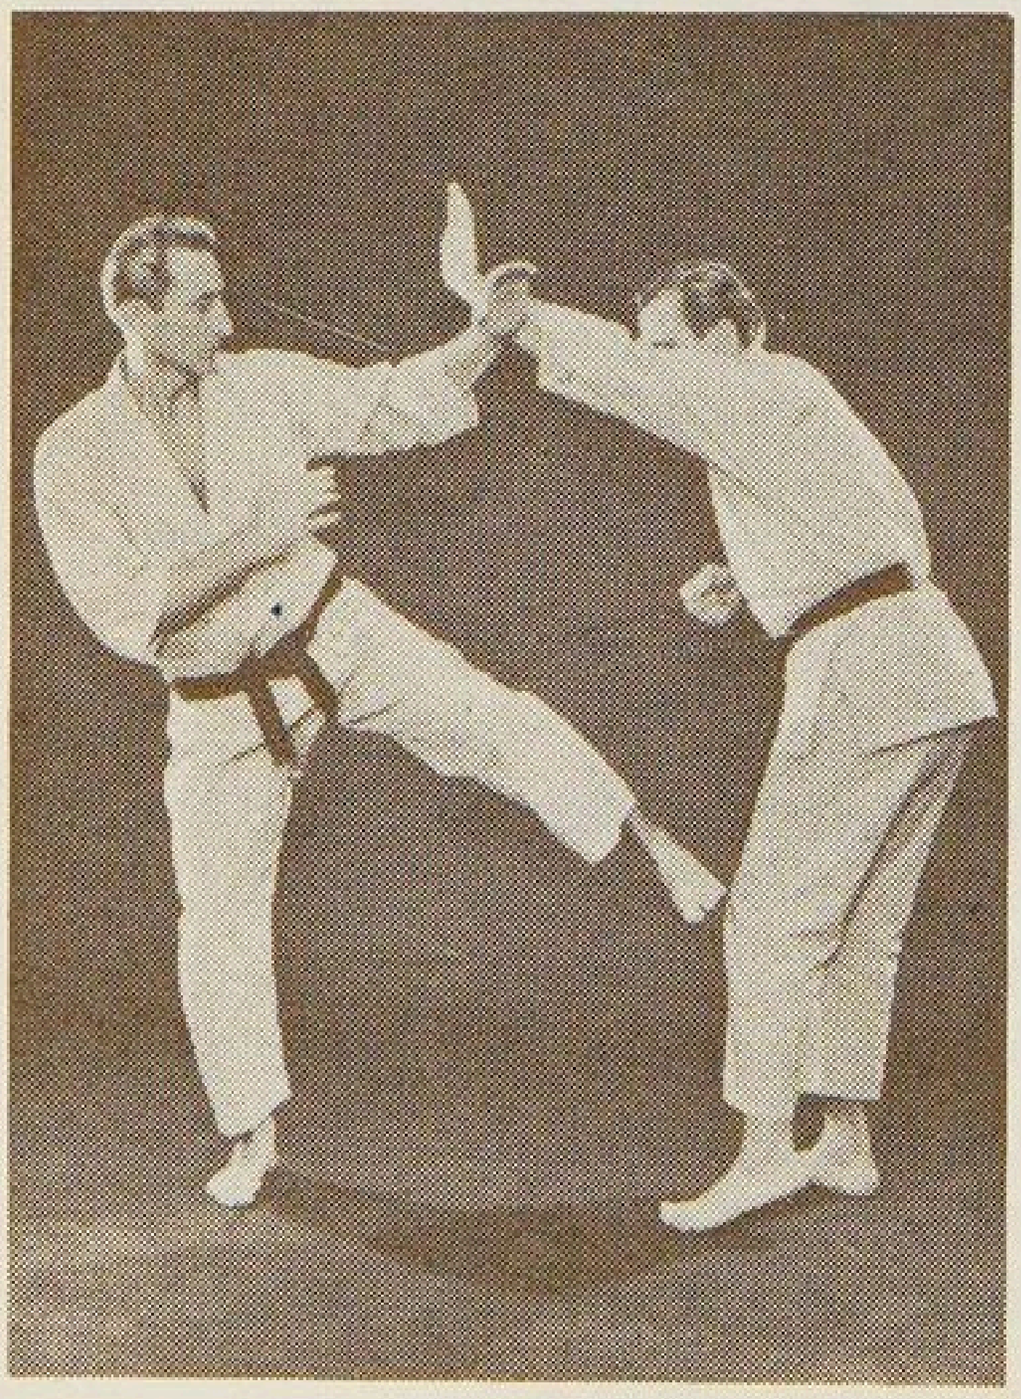
203



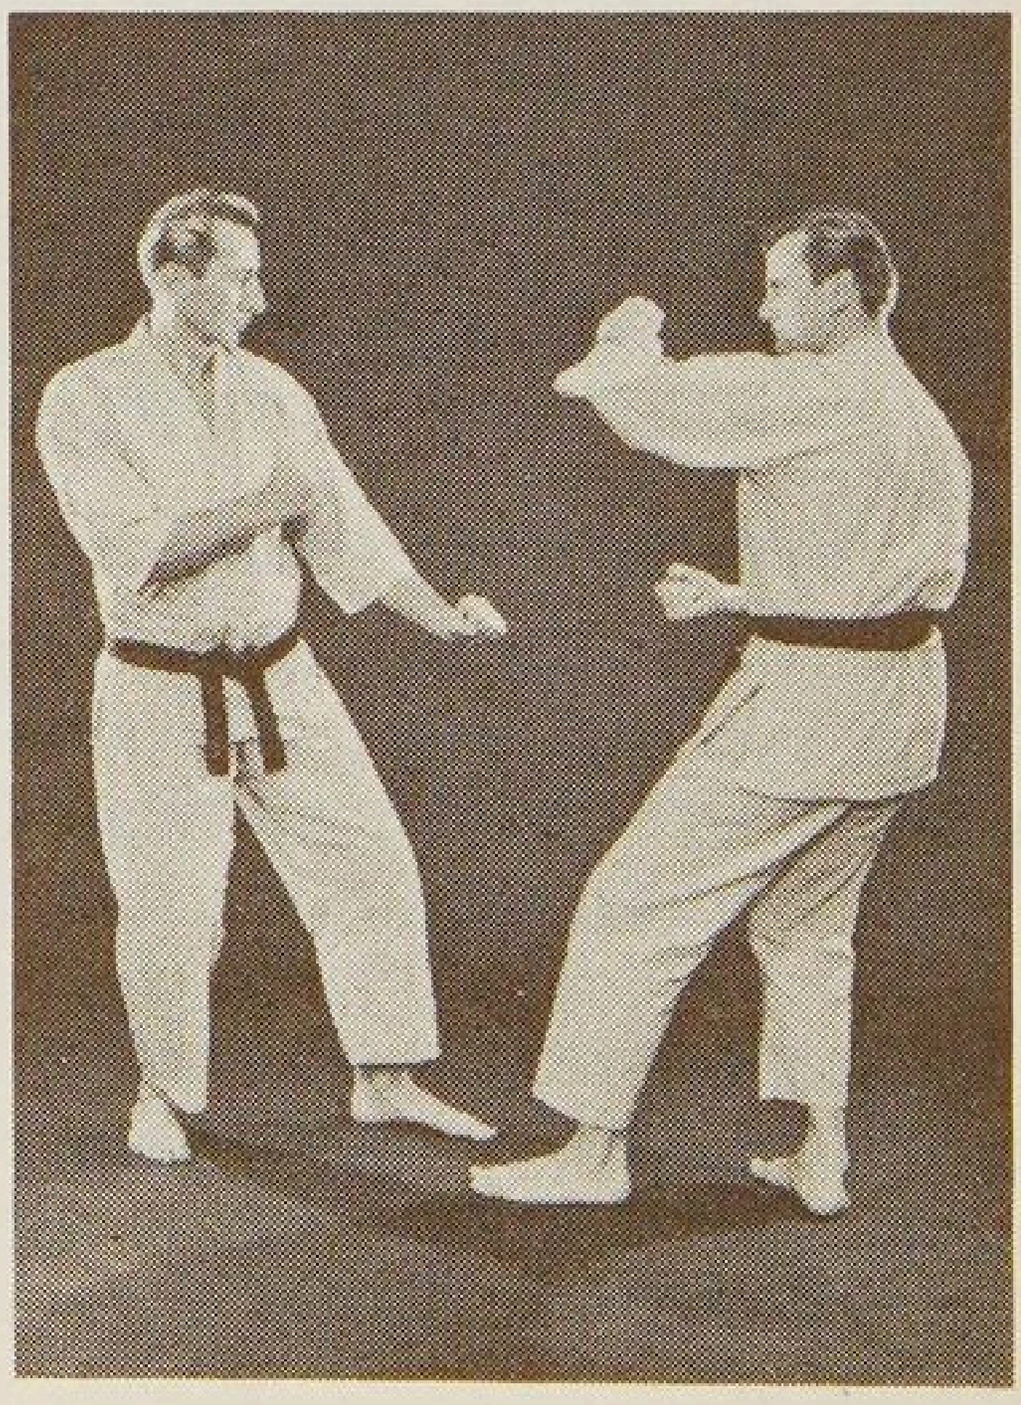
204



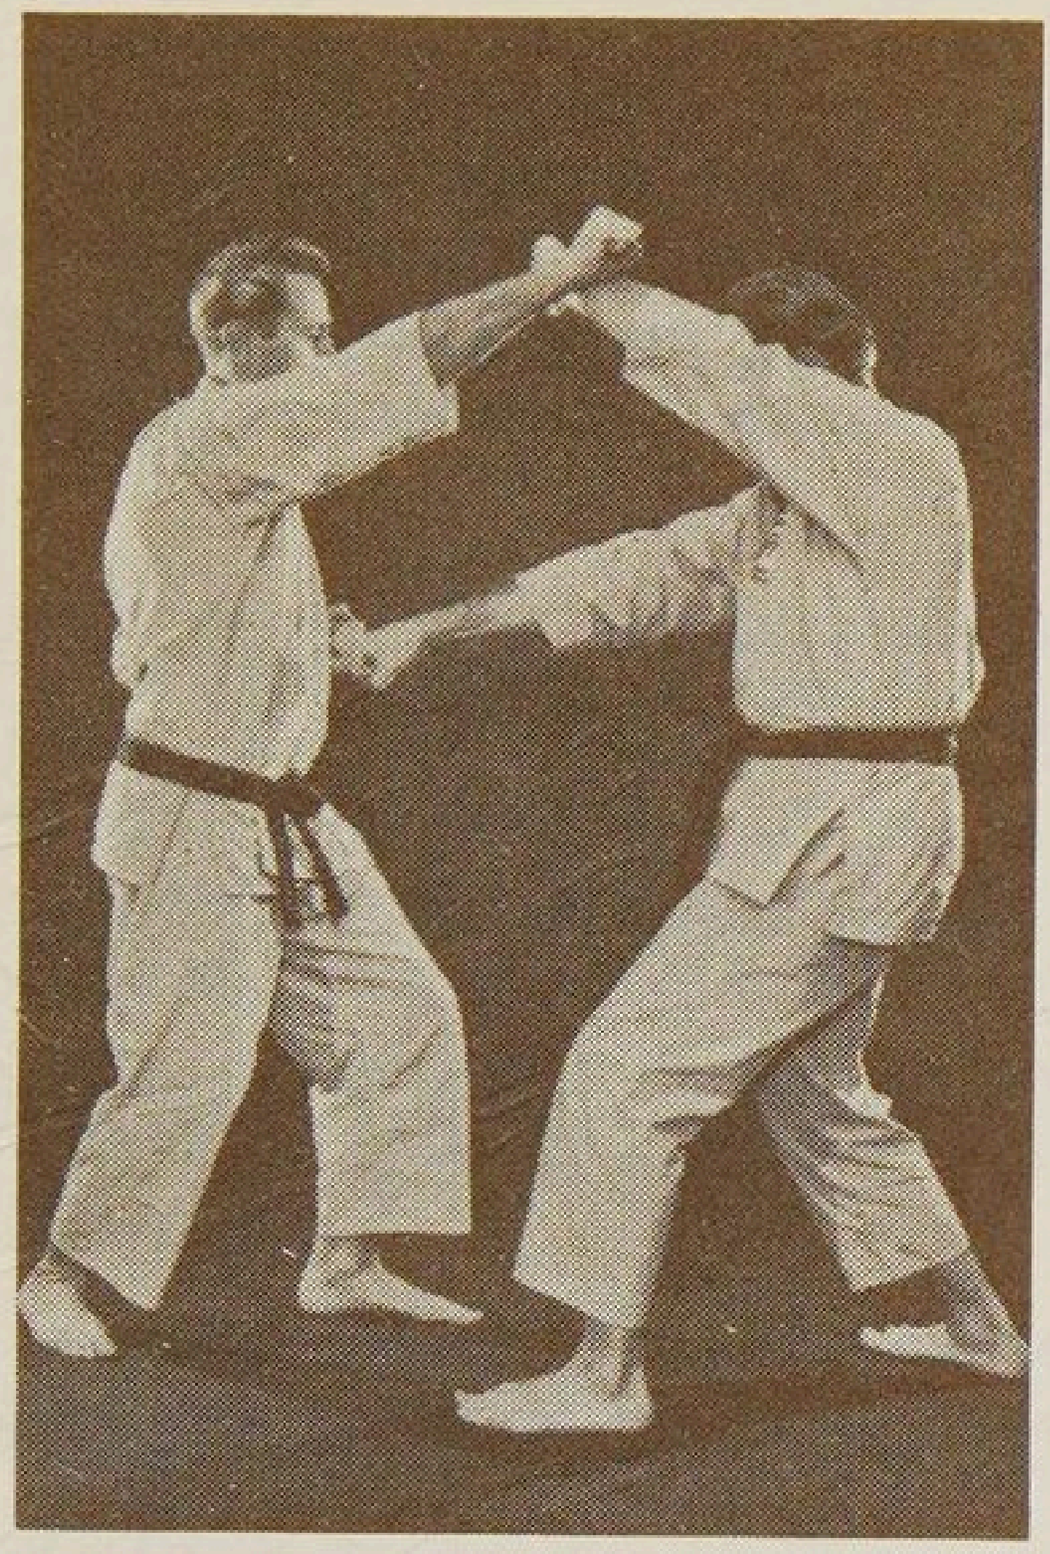
205



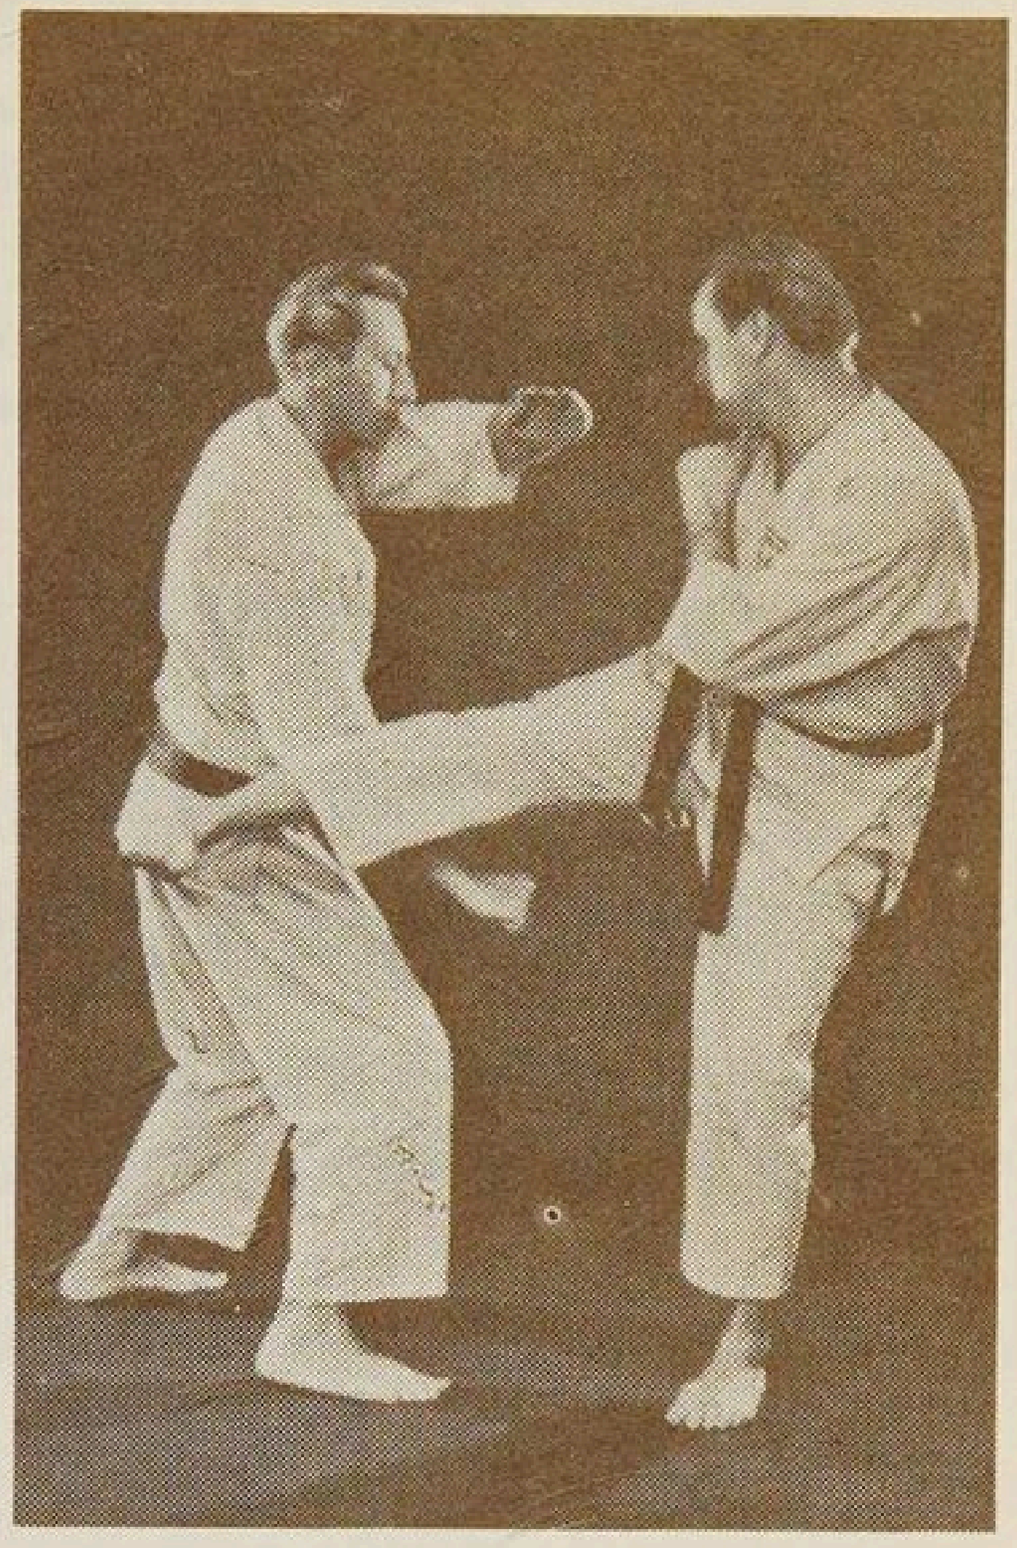
206



207



208



For the test, you then step away into on-guard position. For actual self-defense, continue with hand and foot blows as required.

GIVE AND TAKE SPARRING

Give and take is the intermediate procedure between rehearsed practice and free-style sparring. Unlike rehearsed practice, there is no indication of what attack or defense techniques will be. This is an excellent type of training to prepare for free-style, because you have the opportunity of playing both roles, attack and defense, but you need not be concerned that your partner will attack during your defense, nor will he actively defend during your attack. The procedure is as follows:

206. Both partners assume fighting stances of their choice.

207. Left partner makes an unrehearsed attack, which right man blocks and counters. (In free-style, there would be an attempt to avoid your block and counter.) Then both partners return to starting position.

208. From the starting position, right man attacks and left man blocks and counters. Both men return to starting position.

These are simply two examples of many types of unrehearsed give and take practice. The demonstration of give and take for the test should not exceed two minutes; in that time there should be ample

evidence of ability to attack, block, and defend appropriately, in good form and with safety.

The target areas for sparring are all those vulnerable points of the body which you have learned up to now. You must avoid hitting into the eyes, windpipe, groin, and kidneys; an accidental contact blow into these areas can result in serious, permanent injury or even fatality.

Blows should be controlled so that they do not come closer than two inches from the intended target; points are deducted for making contact, except in blocking.

HOW TO TAKE THE BLUE RANK TEST

Blue rank test may be given and graded by anyone holding the rank of senior degree, brown rank (3 stripes) or higher.

Ceremony in the rank test has been reduced to a simple, courtesy bow made to the teacher and to each other at the beginning and end of the test demonstration.

It is necessary to have a partner for the test demonstration, though the partner may or may not be taking the test at the same time. If two students are being graded at the same time, they take turns, each one demonstrating each portion of the work before going on to the next part.

Methods of hitting (hand blows) are demonstrated with the partner as reference point, without contact, or against a bag with contact and power. Hand blows are executed from a fighting stance with snap, force, and drive; for the test, it is not sufficient to show theoretical knowledge of how the hand blows are made. Each hand blow is accompanied by the short step which puts body weight into it, and by a yell; a second blow (of the student's choice) follows each hand blow demonstrated.

When the student finishes the demonstration of each portion of the test, he returns to a natural stance. The teacher then indicates which technique is to be done next.

Kicks are demonstrated from a natural stance. Each one is executed with snap, drive, and power; no second foot blow is required for the test. If a partner is used as a reference point, no contact is made; the kicks can be demonstrated against a bag, with contact.

Nerve centers and pressure points are either indicated by simulating a hand or foot blow to the exact striking area, or they are orally described by the student.

Methods of avoiding and stopping attacks are demonstrated beginning from a natural stance; the partner simulating the attacker should begin from a fighting stance. Even though the attack and response are prearranged, the attack should be made in a fashion which resembles actual attack. The defenses should be made quickly, smoothly, without loss of balance, and the counter-attack must follow.

In demonstrating the holds and locks, the students must be particularly aware of the rules of safety; jerking, smashing actions are to be avoided. The motions should be smooth and flowing with rounded body movements. Balance and body control are to be maintained throughout. In demonstrating the *use* of the holds and locks, *applications* of the techniques are being shown. They, also, should be smooth and controlled. Observe safety rules very carefully.

Falls are to be demonstrated with technical perfection; timing is the most important element; the vigor and proper placement of the hand slap will be evaluated. Even if the other aspects of the falling demonstration are correct, if the student's head touches the mat, the fall is invalid for the test.

For the test, *every* throw is demonstrated with pre-throwing action. The pre-throwing action should be simulated, but executed with vigor and drive. There is no hesitation between the pre-throwing action and the application of the throw. Observe all rules of safety; no contact is made on your partner in the pre-throwing action and the throw is made without roughness. Speed of the demonstration is somewhat less than combat speed, but it is not slow motion. However, speed is less important than good technique for this test. A fast action which is sloppy will be worth fewer points in the test than a very good and correct technique which might be somewhat slow. Although the partner offers no resistance, he does not merely fall down at the suggestion of the throw; the throw must be a clear-cut demonstration of ability. At the finish, the student who throws must immediately step back into strong balance. For beginning practice you have eased your partner onto the mat, but for the test you will apply full throws and release your hand grips when the throw is obviously successful.

'st grip defenses are demonstrated with clean action and a ...appy release; after each defense, student assumes strong position of retaliation.

The tone of the defenses against minor attacks must be appropriate to the situations. Though the defenses against these attacks include the possibility that they are serious, for the test demonstration they are all treated as minor. That is, if applying a wrist grip defense on the street, if your assailant meant to harm you, you would respond as though to serious attack, finishing with hand and foot blows and takedowns, when needed. But, for the test, at the conclusion of the main part of the defense, one retaliatory blow is simulated and then you take one step back into T-position.

Demonstration of the defense against violent attacks for this test is judged more for correctness of technique than for speed. This test is not combat, but an evaluation of the students' basic knowledge.

On-coming fist attack: Finish with back takedown. Rear body grab: Finish with hand and foot blows. Club attack, knife attack, surprise attack: Finish as indicated in the instruction.

Give and Take Sparring: Sparring begins with a courtesy bow to each other. Students are evaluated on appropriateness of response to attack, on the ability to attack efficiently, and on general body control and agility. At the signal from the instructor that sparring time is over, students bow. Then they bow to the instructor and take a seated position on the mat to wait for the grading of the test.

A score of 75% is passing for blue rank and all other tests up to black belt.

BROWN RANK — INTERMEDIATE DEGREE (One Stripe)

How to Strike: Ten Intermediate Hand Blows

How to Kick: Ten Intermediate Foot Blows

Nerve Centers and Pressure Points: Vulnerable Areas of the Body
- Front
- Back

Kicking Defenses
- Toe Kick Defense
- Knee Kick Defense
- High Kick Defense

Holds and Locks (for Formal Demonstration)
- Wrist Hold #2
- Under Arm Lock
- Straight-Up Arm Lock
- Choke Hold; Knuckle in the Back
- Bent Arm Restraining Hold

Uses of Holds and Locks: Showing Attack, Defense, and Takedown

Falls

- First Attack — Out of Range: Parry Defense
- Back Body Grab — Over Arms
- Rear Choke with Forearm
- Club Attack — Back-Handed
- Knife Attack — Slashing Style

Free-Style Sparring

How to Take the Test: Brown Rank (One Stripe)

HOW TO STRIKE: Ten Intermediate Hand Blows

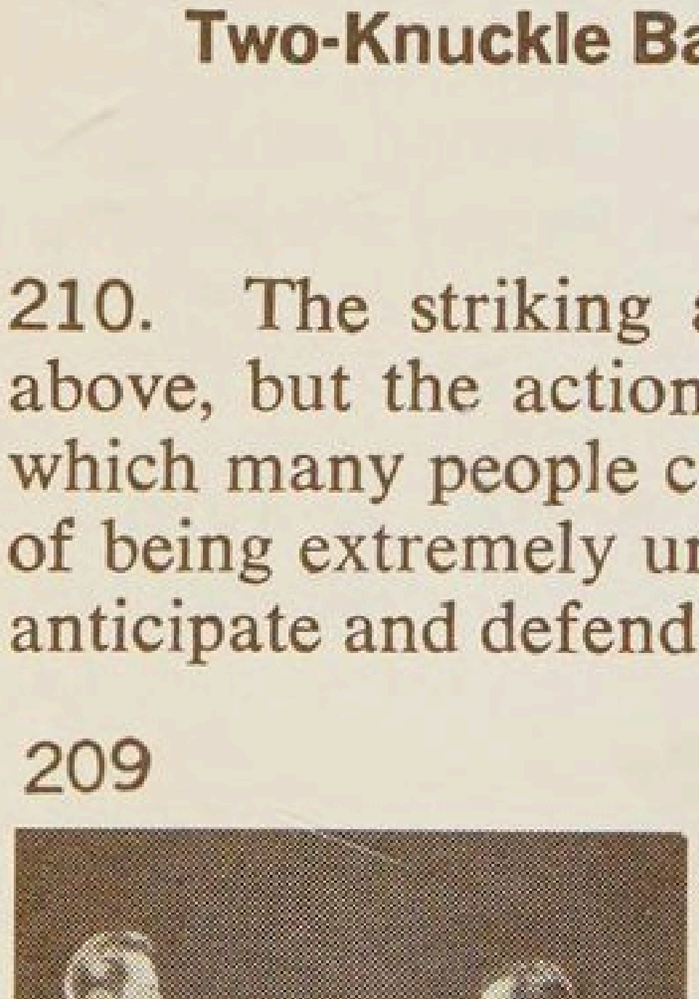
Two-Knuckle Punch — Straight Out

209. Using the two large knuckles as the striking point, the direction of this blow is straight out. As with any knuckle blow, it is most practical if directed only into soft areas of the body to avoid injury to your hand. This is a power blow, not suitable for women and not an effective blow against a very much heavier adversary. Its value is that it is a familiar blow to which men have been conditioned in the Western world for many years. The action should be snappy, with recoil. Although most often used in the manner shown, palm down, variations of this blow are with the fist held horizontally or with the palm up if the blow is delivered in an upward direction.

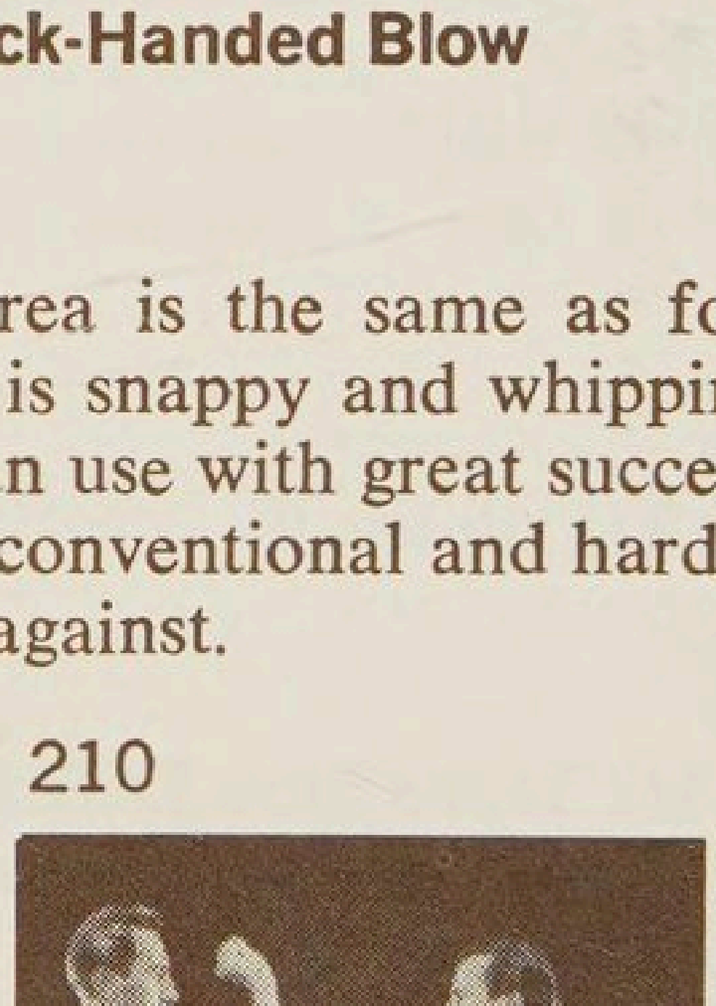
Two-Knuckle Back-Handed Blow

210. The striking area is the same as for the blow described above, but the action is snappy and whipping. This is not a blow which many people can use with great success but it has the virtue of being extremely unconventional and hard for your adversary to anticipate and defend against.

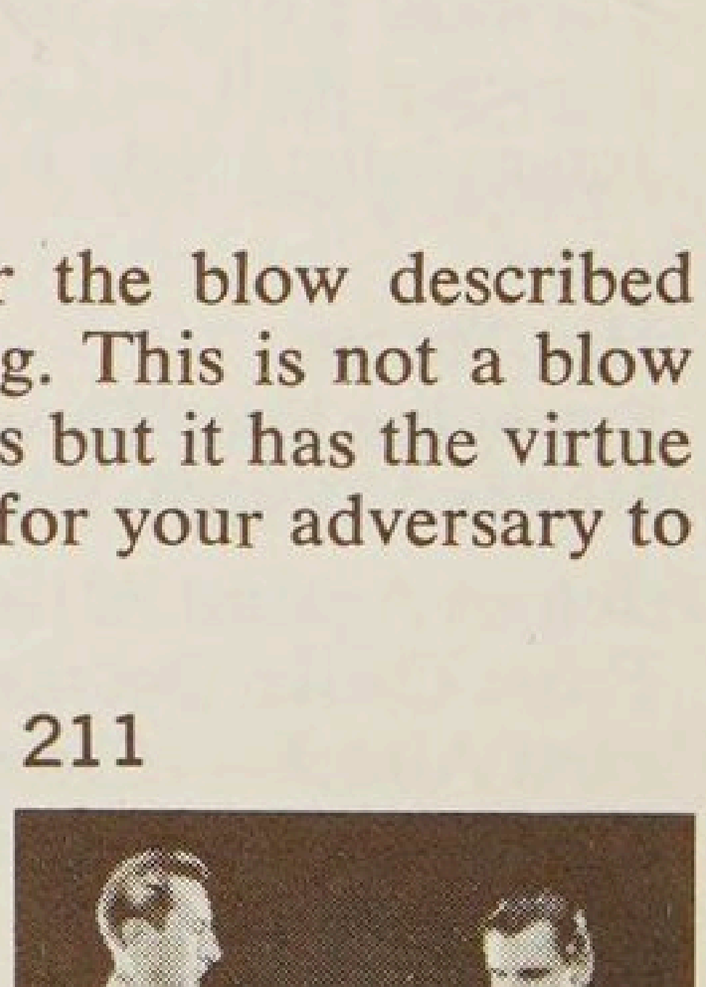
209



210



211



Foreknuckle Blow — Rear

211. Using the extended foreknuckle as the striking point, the direction of the blow is a back and upward hook. The penetration power of the extended knuckle gives this blow its value and since the target area is likely to be into soft parts of the body, it is practical and effective.

Open-Handed Finger Stab — Front

212. The fingers are somewhat spread and held rigid and firm. The main value of this blow is that it can be used by small people with good results; your adversary will usually react by pulling back sharply at the threat of being poked or clawed in the face, giving you an opening for a follow-up attack.

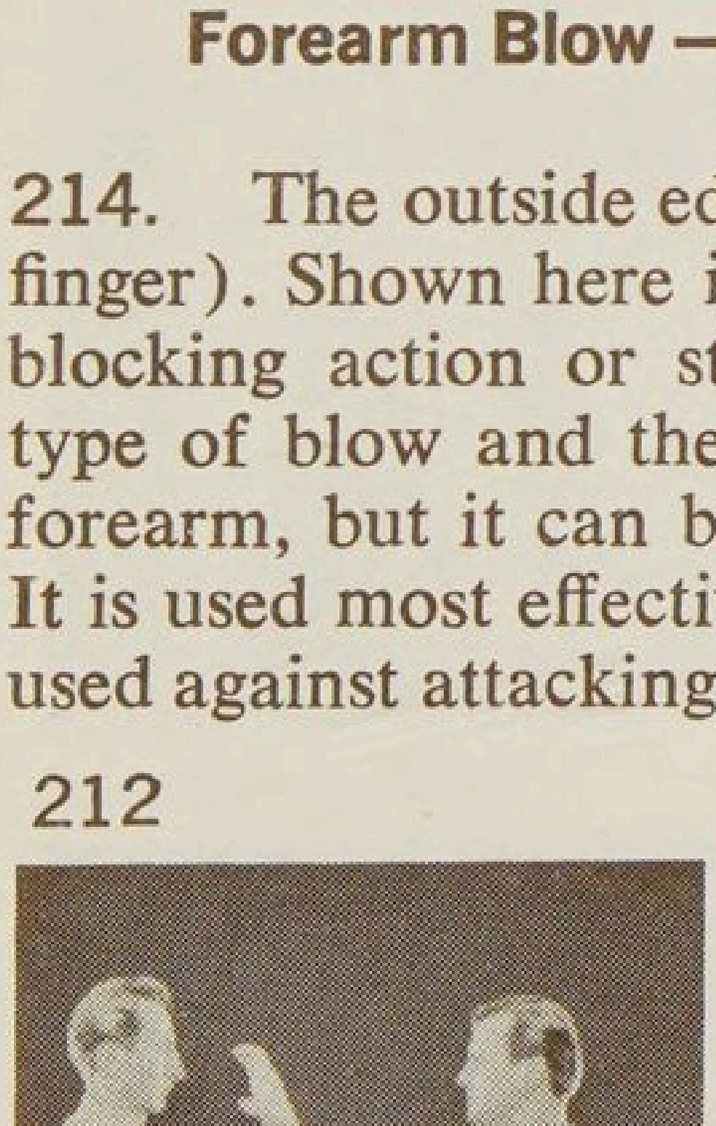
Open-Handed Finger Stab — Rear

213. As an actual blow or as a diversionary tactic, this is a good technique against rear attack. Use quick, stabbing action into the face or throat.

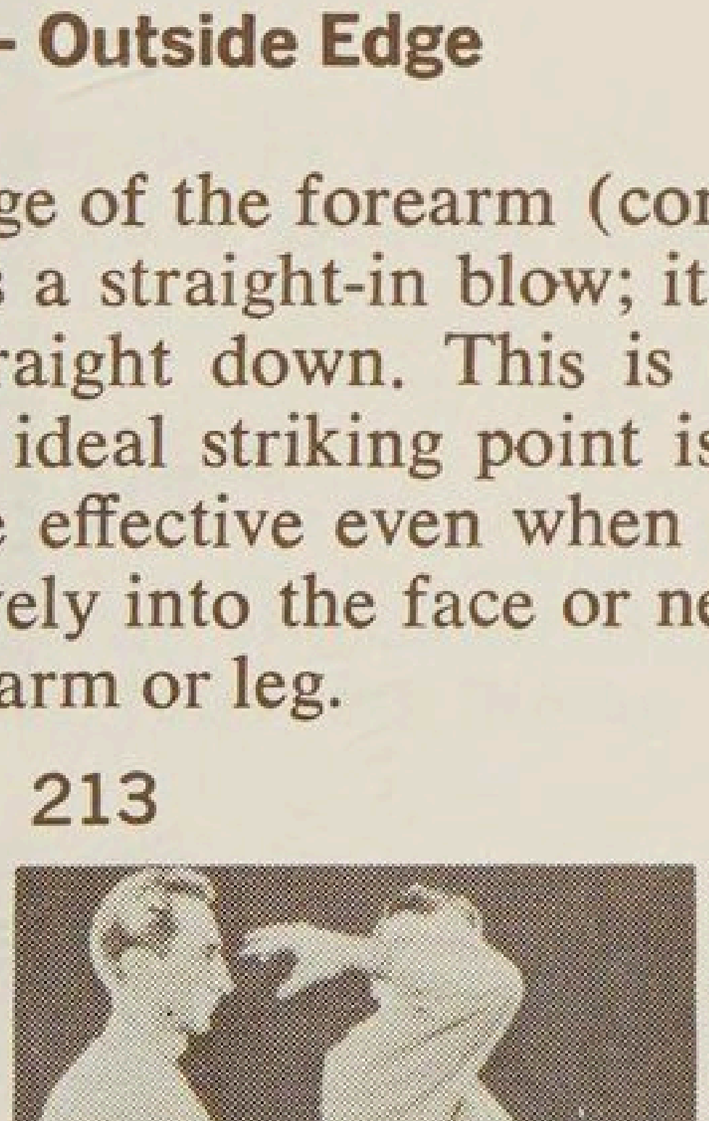
Forearm Blow — Outside Edge

214. The outside edge of the forearm (continuing from the little finger). Shown here is a straight-in blow; it can also be used as a blocking action or straight down. This is a ramming, smashing type of blow and the ideal striking point is in the middle of the forearm, but it can be effective even when not exactly on center. It is used most effectively into the face or neck but for blocking is used against attacking arm or leg.

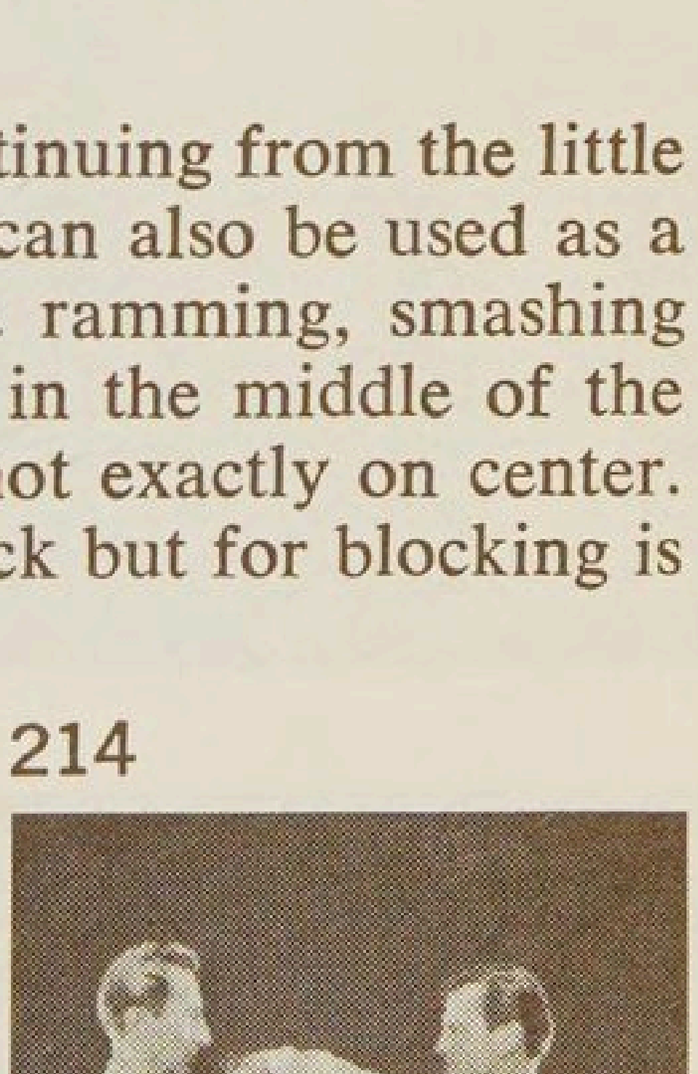
212



213



214



Forearm Blow — Inside Edge

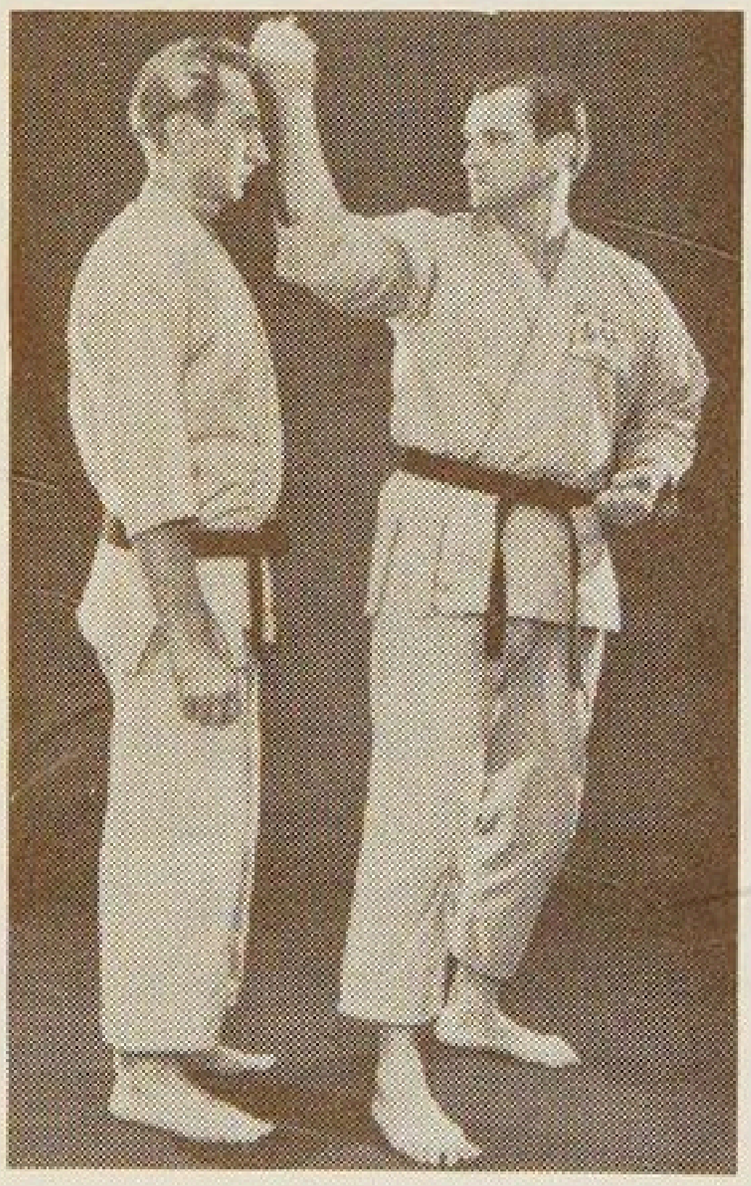
215. The inside edge of the forearm (the thumb side) is best used as a back-handed blow or block and is most effective used in combination with the previous blow. This is more of a snapping rather than ramming action. Use is similar to outside edge blow.

Elbow — Front

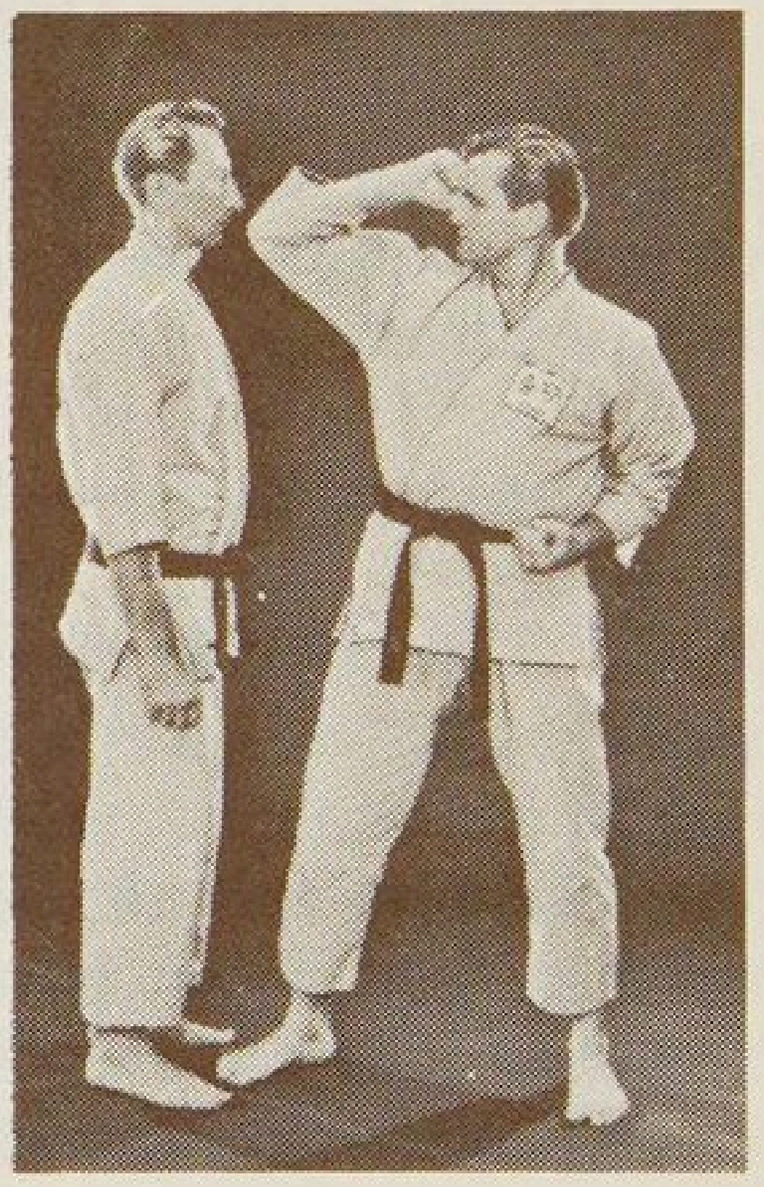
216. Used to the front, the elbow blow can be a very effective double hit, from side to side, or up and down. The target area is usually the head or face.

Elbow — High Rear

217. The action of this blow is up and back, the striking area the point of the elbow. An excellent blow for a smaller person against a larger adversary. Use a ramming action under the chin or into the face.



215



216

217

218

Elbow — Rear, Vertical

218. Think of this as a double blow, from side to side, striking into the head or face.

HOW TO KICK: Ten Intermediate Foot Blows

Edge of the Foot — Forward

219. The action in the next three kicks is essentially the same — what is different is the direction of the blow. With your adversary directly in front of you, turn your kicking foot to the side, kick into the knee area, and complete the action by scraping down the shin and finish by hitting onto the instep. With shoes on, this is a very effective blow and can be used effectively by anyone, regardless of size or strength. The first part of the kick is snappy, the finish is grinding or stamping.

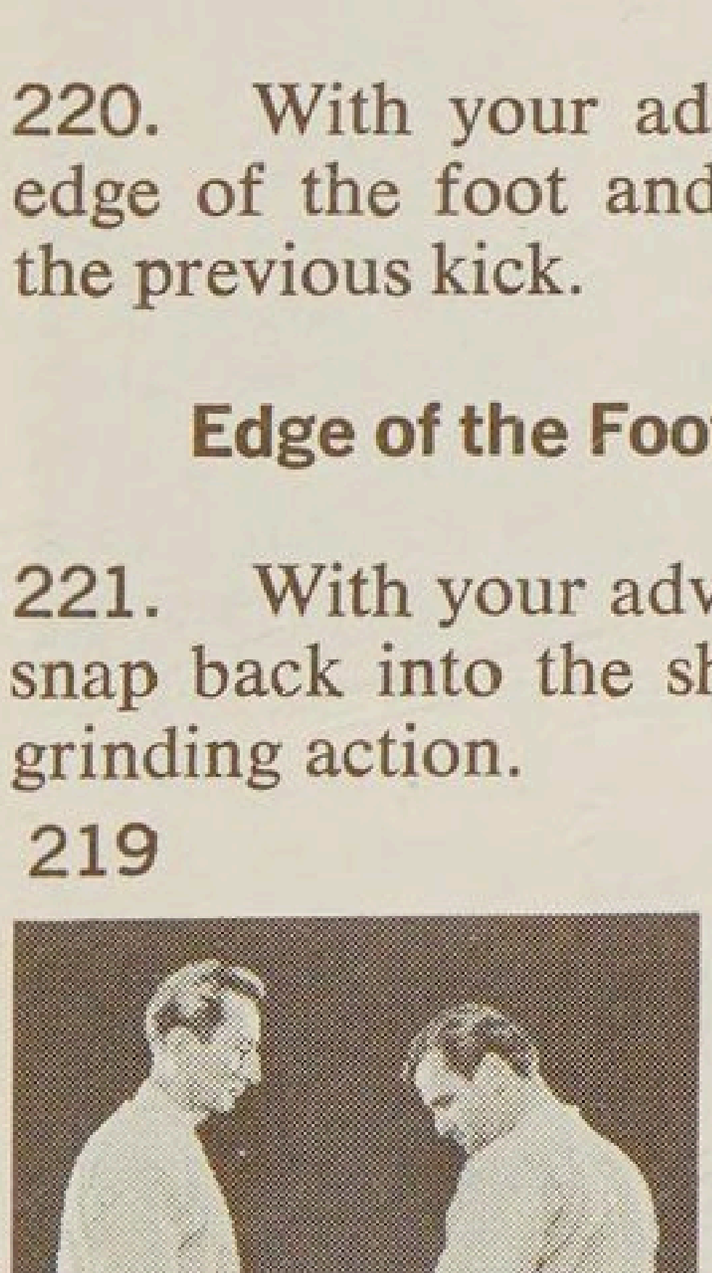
Edge of the Foot — Side

220. With your adversary to your side, kick outward with the edge of the foot and follow through in the same manner as for the previous kick.

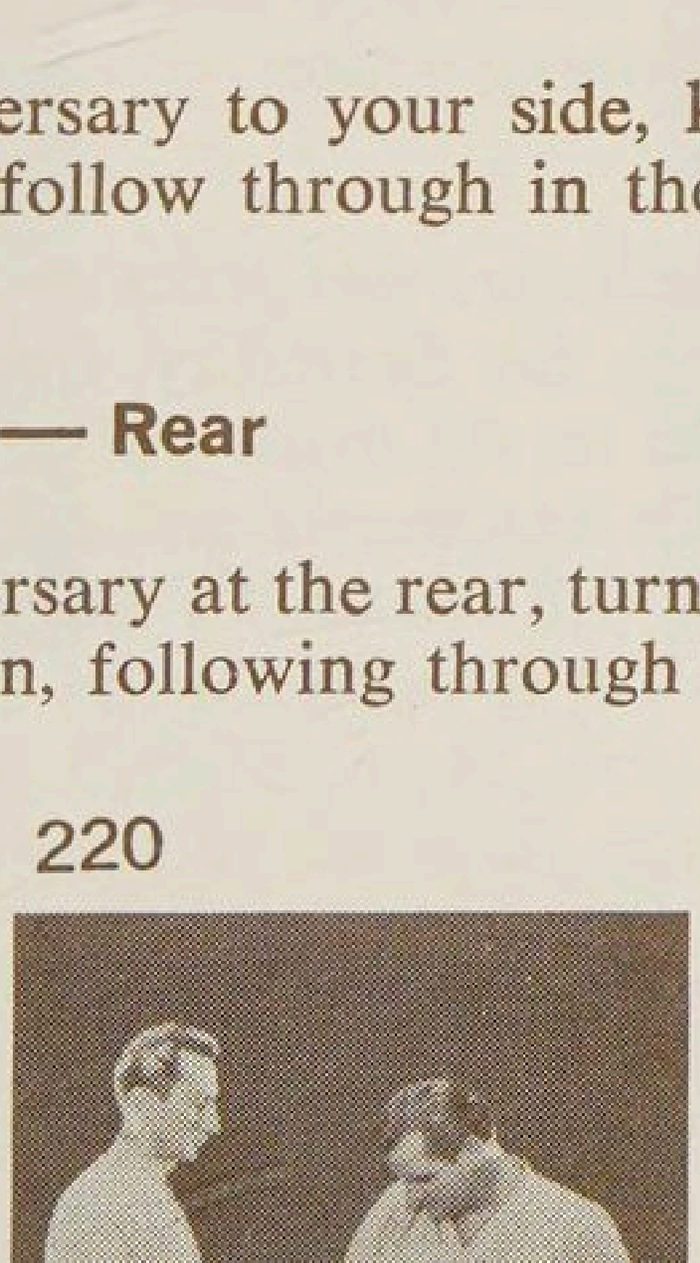
Edge of the Foot — Rear

221. With your adversary at the rear, turn your kicking foot and snap back into the shin, following through with the scraping and grinding action.

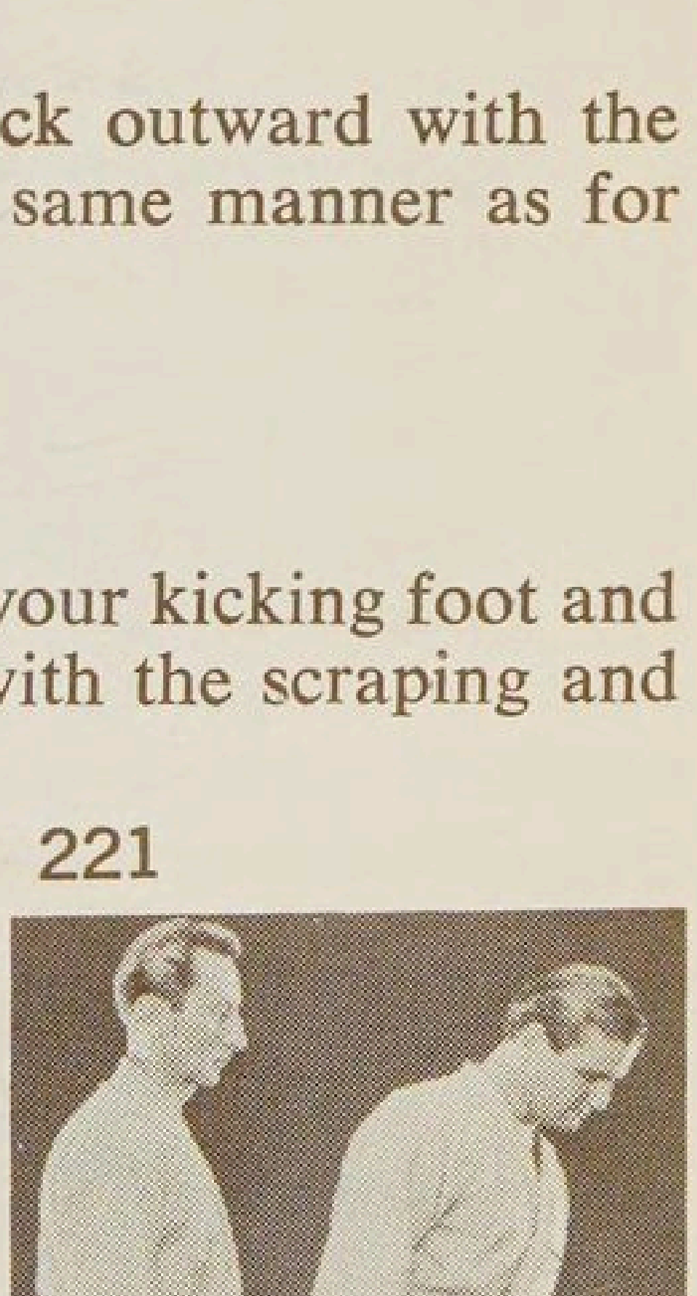
219



220



221



Knee

222. For practical purposes the knee kick is a limited technique. It should only be used when you are already in very close to your adversary; do not step in close in order to deliver a knee kick. The virtue of the knee kick is that it is quite powerful. In the section on "Vulnerable Areas of the Body" you will see why I do not recommend kicking into the groin; for knee kick, the best target area is the middle soft part of the body.

Inside Edge of Foot — Forward

223. As a blocking technique, this is a good kick. Some people find it more comfortable than the outside edge foot blow, but it does not have the same power as the outside edge blow. With a shoe on, however, this is a good and sufficiently powerful blow to use for practical defense. The action is snappy.

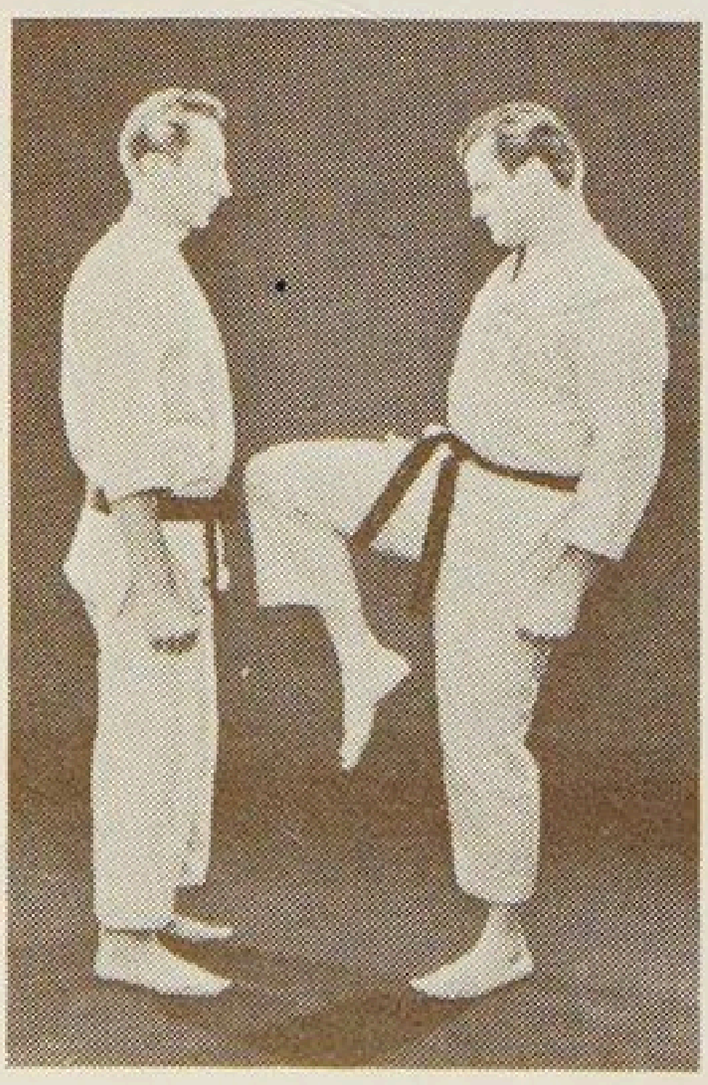
Bottom of the Foot Stamp — Rear

224. This kick differs from the previous rear stamp in that you do not turn your body or pivot as you kick. Though you should turn your head to see the target area, the kick is made by drawing your knee up, turning your foot to the side, and stamping straight back. If you do not turn your foot, you are more likely to miss the target area. This is a stamping action.

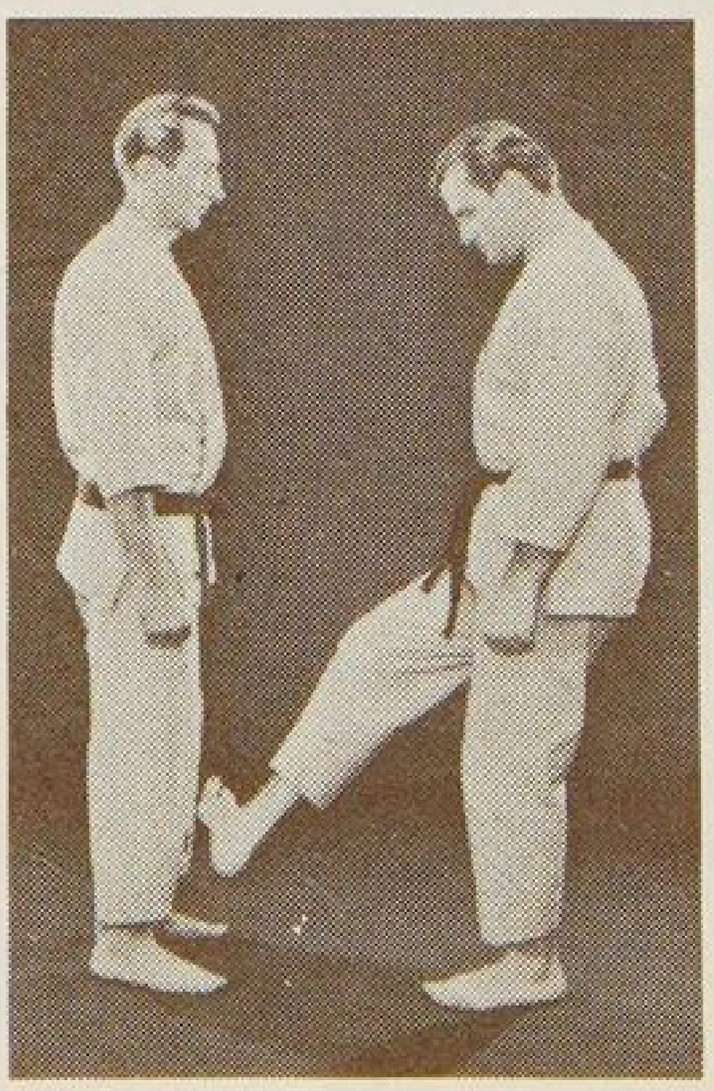
High Arc Kick

225. The next four kicks are *not* practical for self-defense. They are excellent for training, for flexibility, for balance, and they are showy. When you learn to do these difficult kicks well, you will have no trouble with the less showy and more practical low kicks. These are the kicks you will see on TV and in the movies, but you must not forget that what is done on the screen is for entertainment.

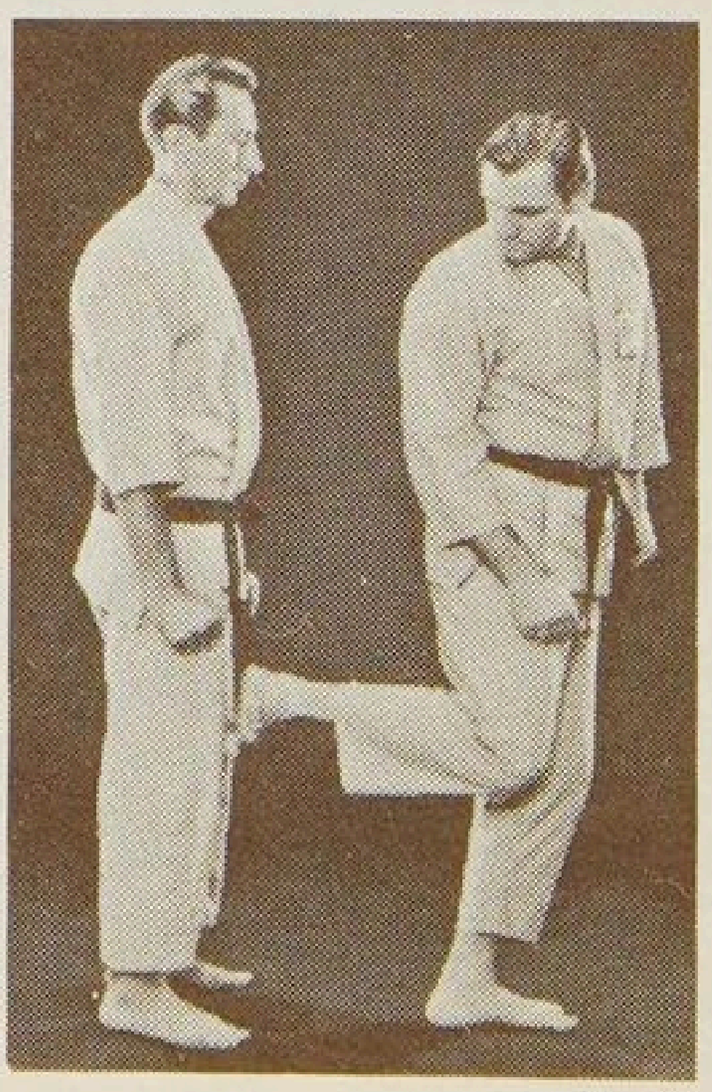
222



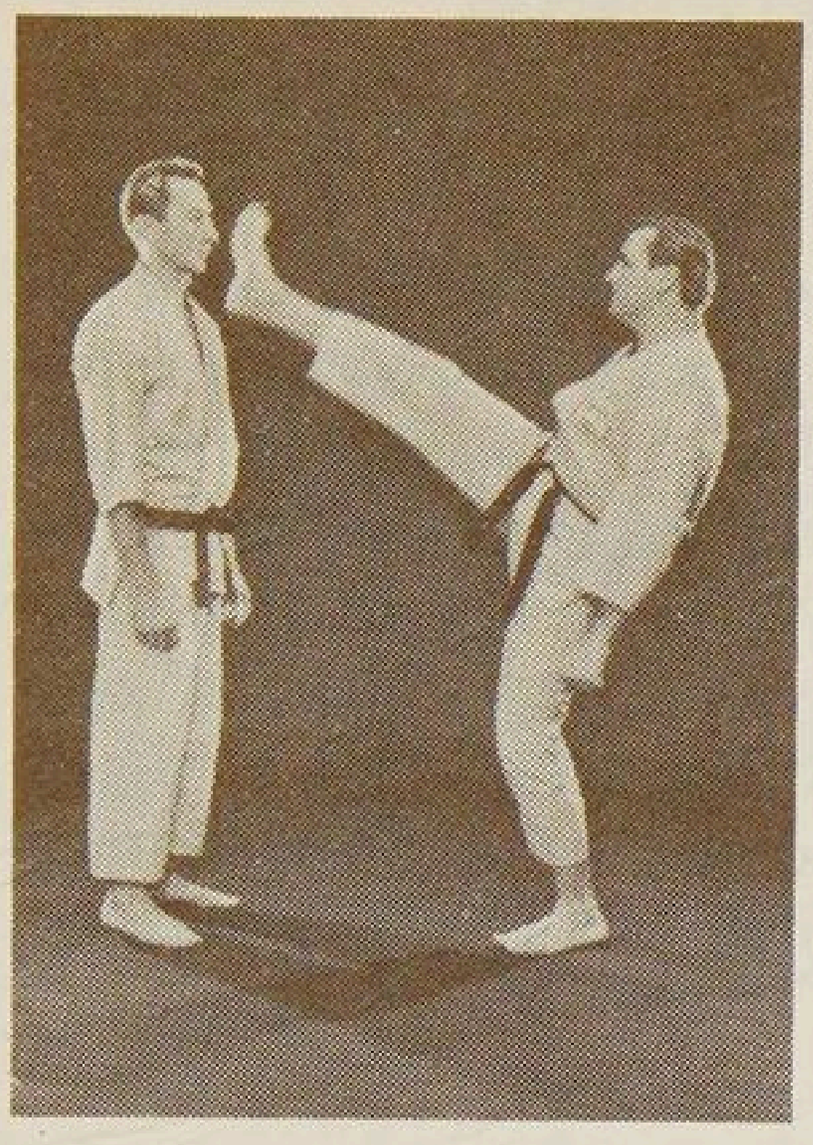
223



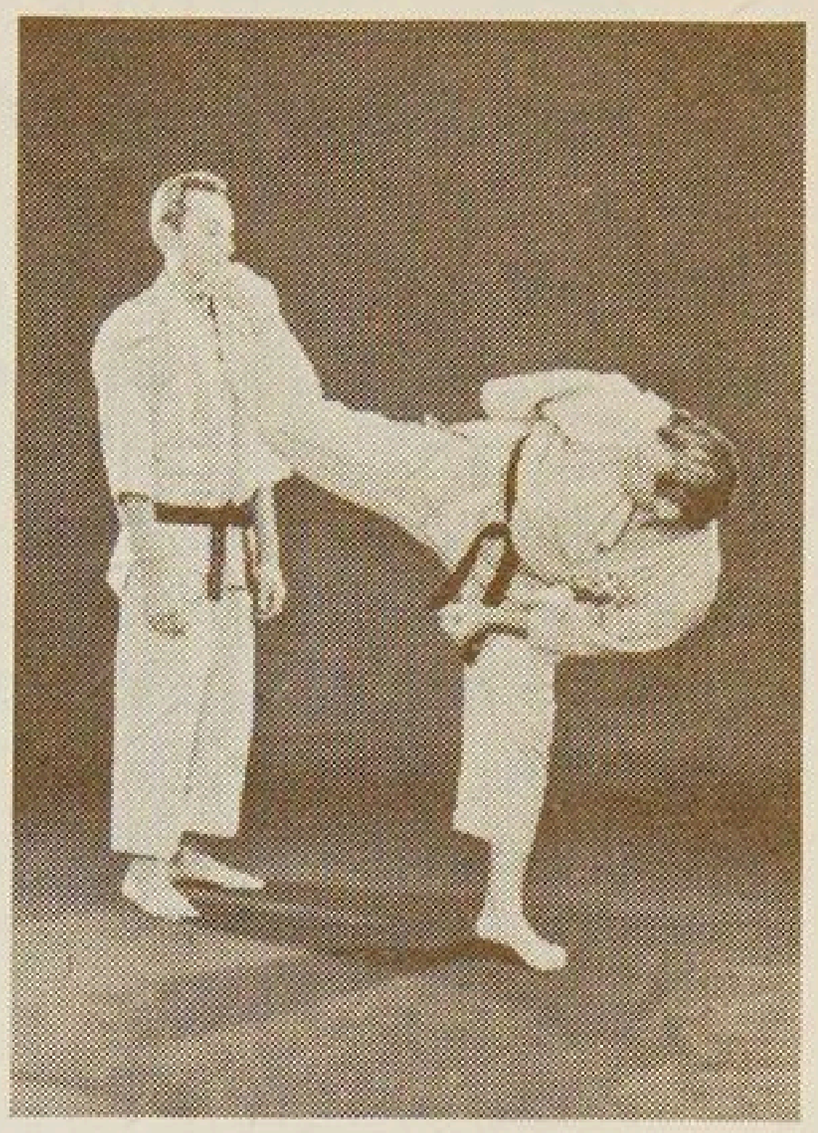
224



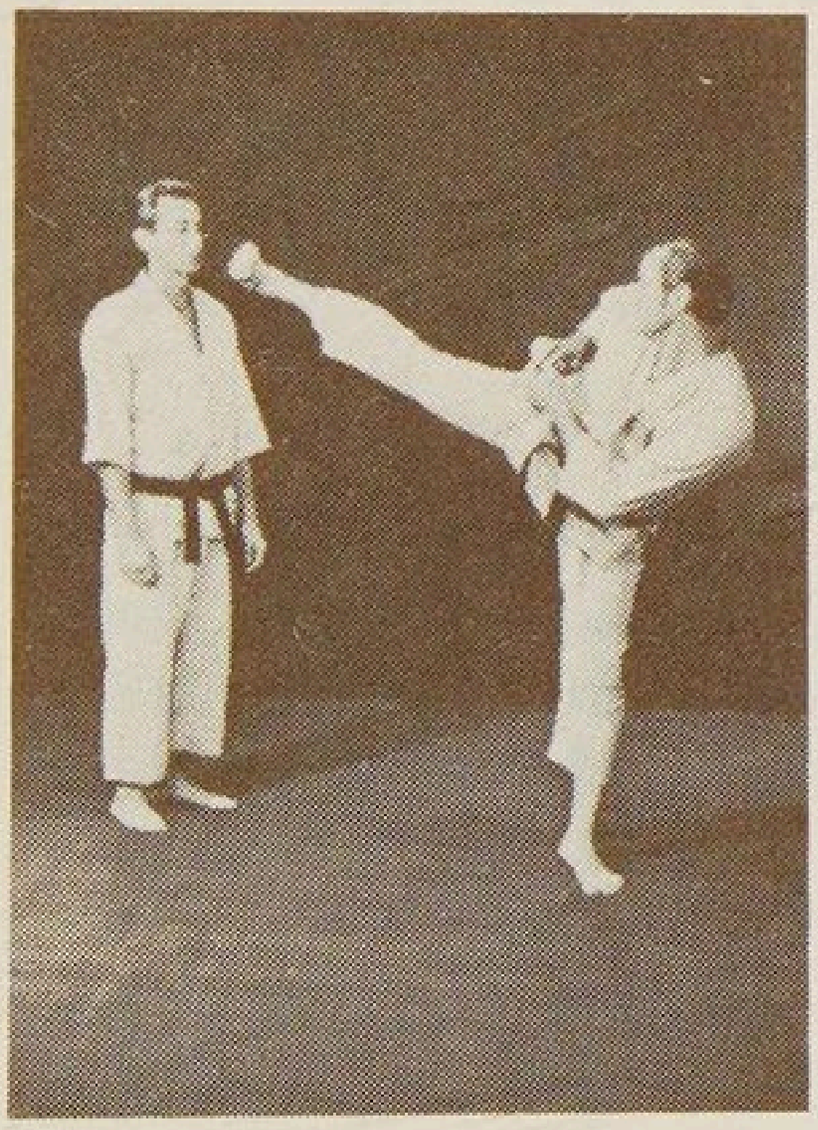
225



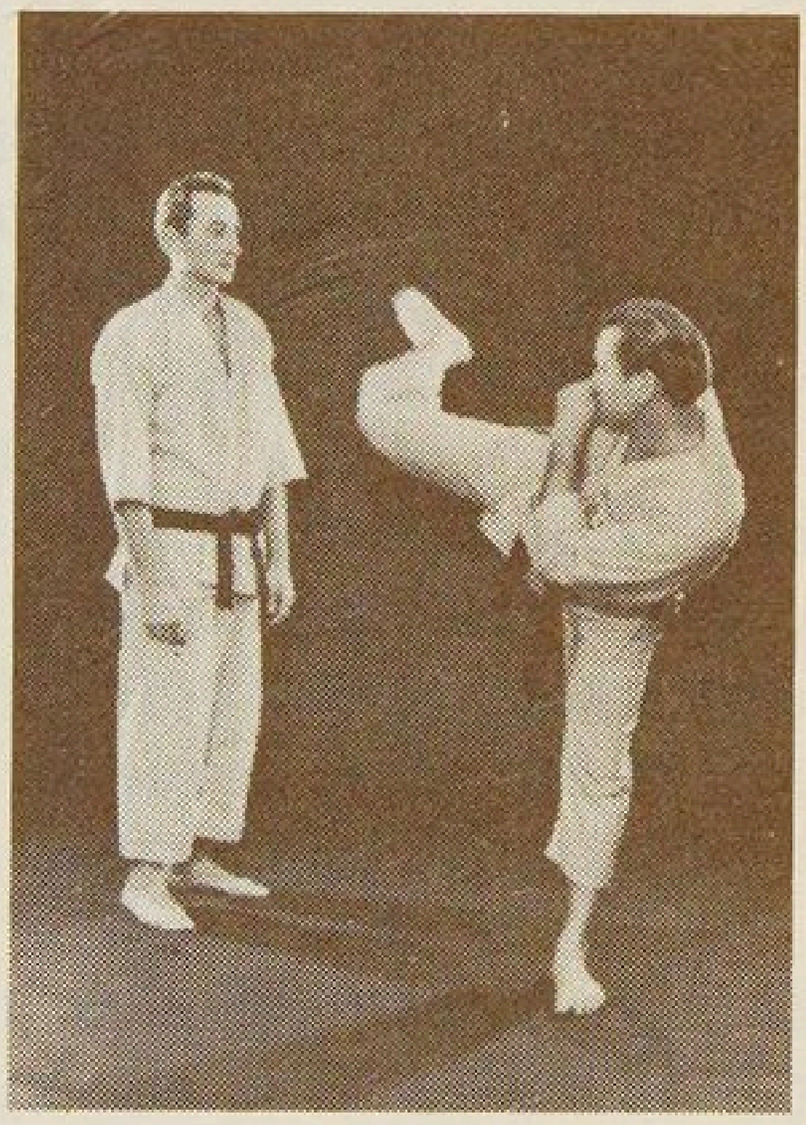
226



227



228



Kicking at head height, kick in an arc, swinging your leg back and forth, as though to strike into the head first on one side and then on the other.

High Stamp Kick — Rear

226. With your opponent directly behind you, lean forward and stamp into the head area as though to hit into the face or under the chin.

High Stamp — Forward

227. Pivot a quarter turn on the standing foot as you kick high, using the bottom of the foot as the striking point.

Hook High

228. Draw your kicking leg up and back and then deliver a circular kick, high. The action is snappy.

NERVE CENTERS AND PRESSURE POINTS:
Vulnerable Areas of the Body

All nerve centers and pressure points do not have equal value as target areas. As a blue rank student, you were taught the most practical striking areas; as a brown rank student, you are expected to learn many more target areas and you will be expected to know which are more practical than others. It is not enough to know *where* to hit; to understand and evaluate the effectiveness of any blow, you must differentiate between a blow struck by a slight person and a blow struck by a strong person or a blow struck against a frail person or a blow struck against a big, heavy person.

Front

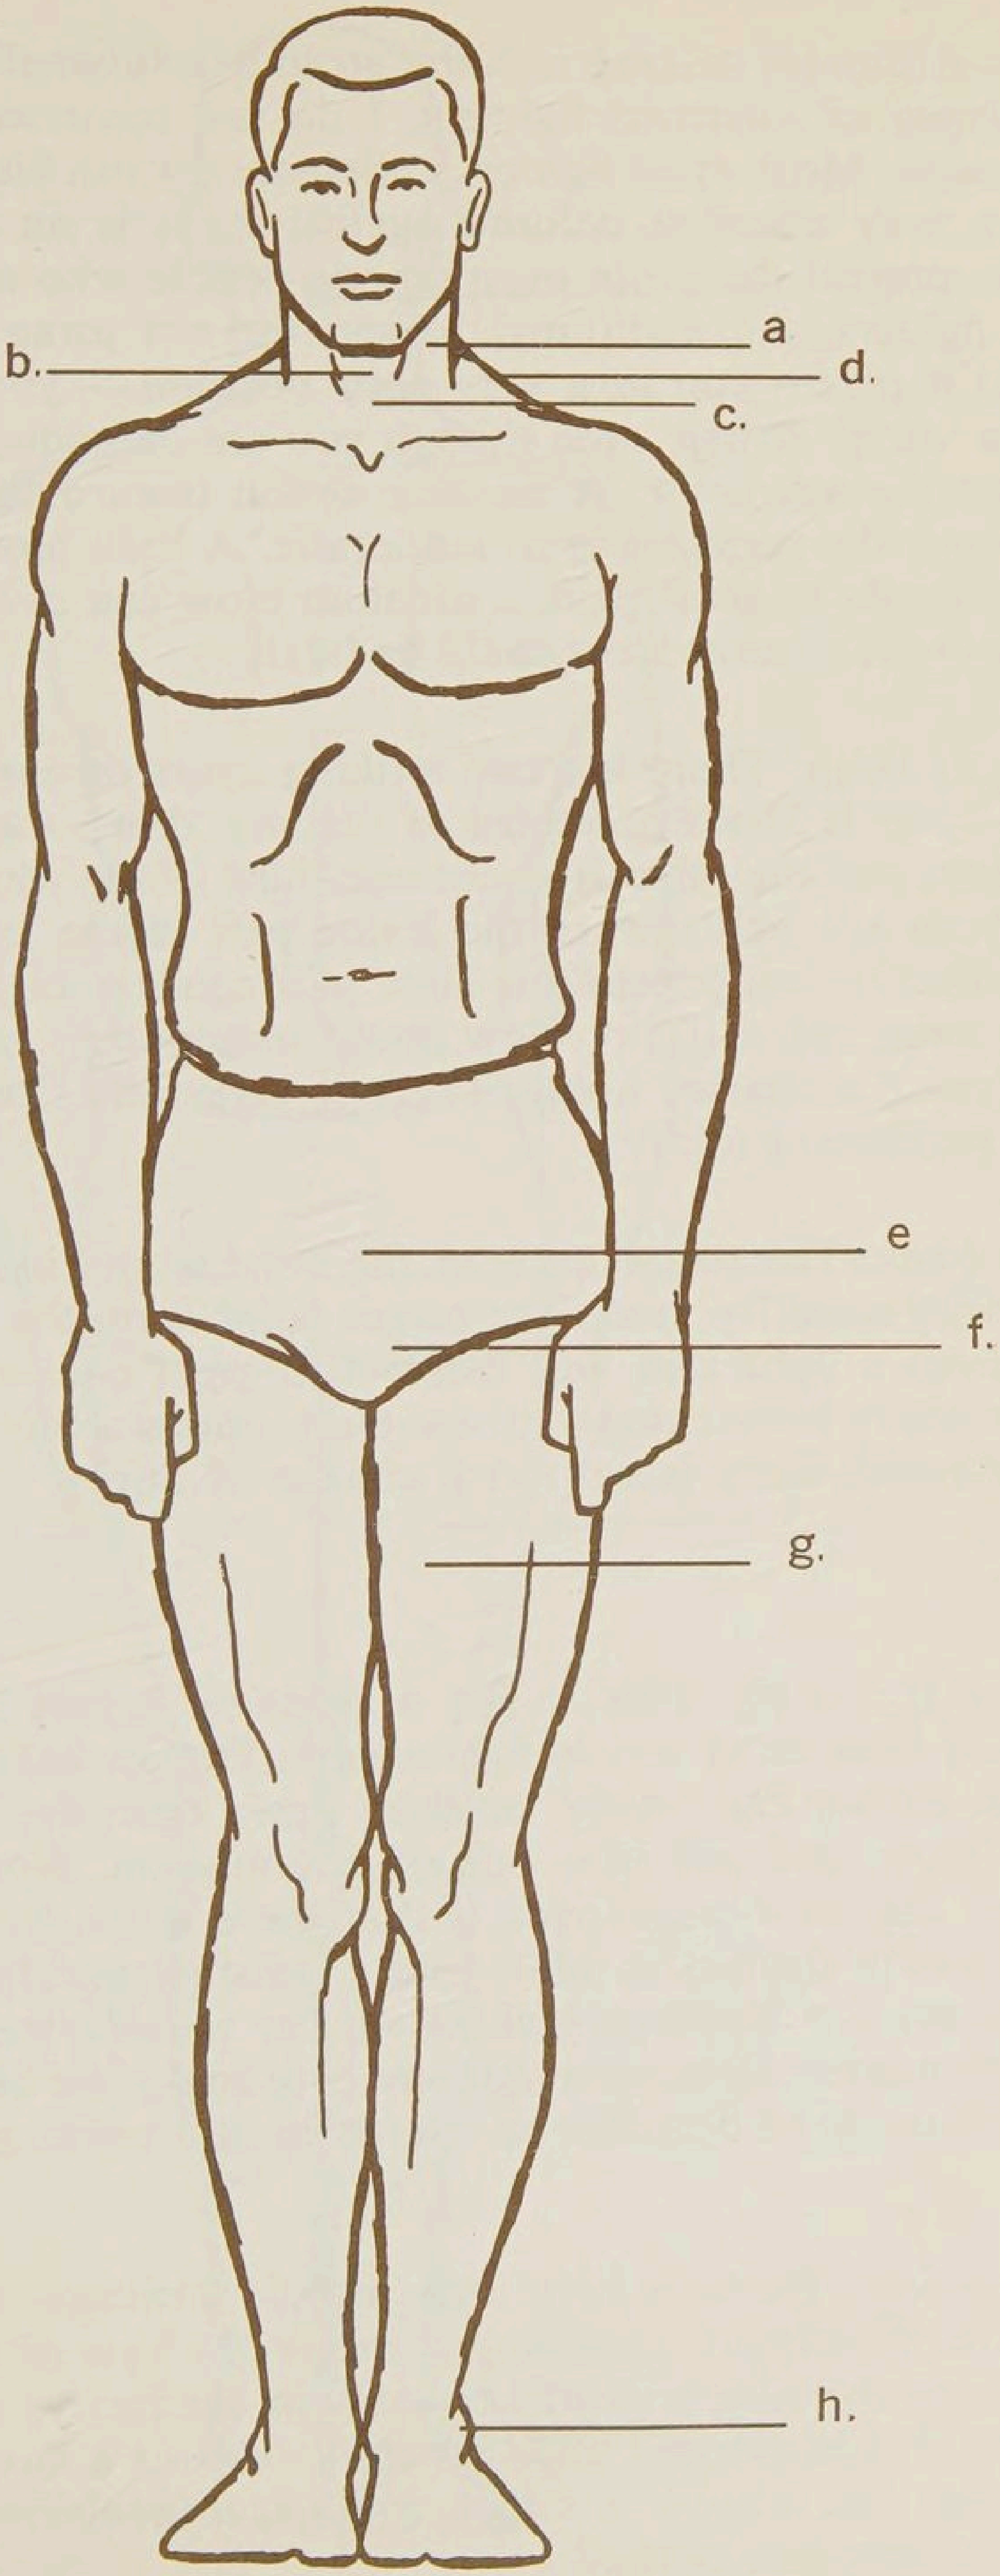
a. *Neck muscle:* If you turn your head, you can feel the long muscle which runs from under the jaw down to the collarbone, in the middle of which there is a nerve. A slight digging pressure will result in discomfort; a knuckle or finger stab with vigor will cause great pain, though there is no great likelihood of injury more serious than a stiff neck.

b. *Windpipe (Adam's apple):* This is a target area which should only be used in event of serious, vicious attack. A digging pressure causes great pain, choking, and gasping. A light hitting blow can cause stun; a medium blow could result in unconsciousness; a heavy blow can be fatal.

c. *Hollow of the throat:* This area is the small depression below the windpipe. It is also an area to be avoided unless you are being seriously or viciously attacked. It is not as available as the windpipe, but the results of pressing, stabbing, or poking are similar to those which occur when striking the windpipe.

d. *Shoulder muscle:* At the base of the neck where it joins the shoulder is a concentration of nerves and muscle. A light blow to this point causes discomfort; a medium blow results in temporary numbness; a heavy blow can immobilize the arm for a short period. There is very little possibility of serious injury, even with a heavy blow. The one drawback of this target area for a small person is that it might not be readily available.

e. *Abdominal area — bladder:* A blow struck very low into the center of the abdomen, will hit the bladder. A light blow will cause pain; a medium blow can double up your adversary and cause stun; a heavy blow could rupture the bladder, which might be fatal.



a
b.
d.
c.
e
f.
g.
h.

f. *Groin:* Although striking into the groin is a favored technique of many types of unarmed fighting, I do not recommend it for several reasons. Most street fighters anticipate a groin kick and will build up a very effective defense against it. It is an automatic response to protect the groin even among people who are not experienced fighters. An additional reason for not using the groin kick is that it places you in a very poor position — you are considered the "dirty" fighter even though you are defending yourself and are not the aggressor. A feinting action toward the groin is excellent since the response is so automatic. A light blow into the groin area results in great pain; a medium blow can cause stun or unconsciousness; a heavy blow could be fatal.

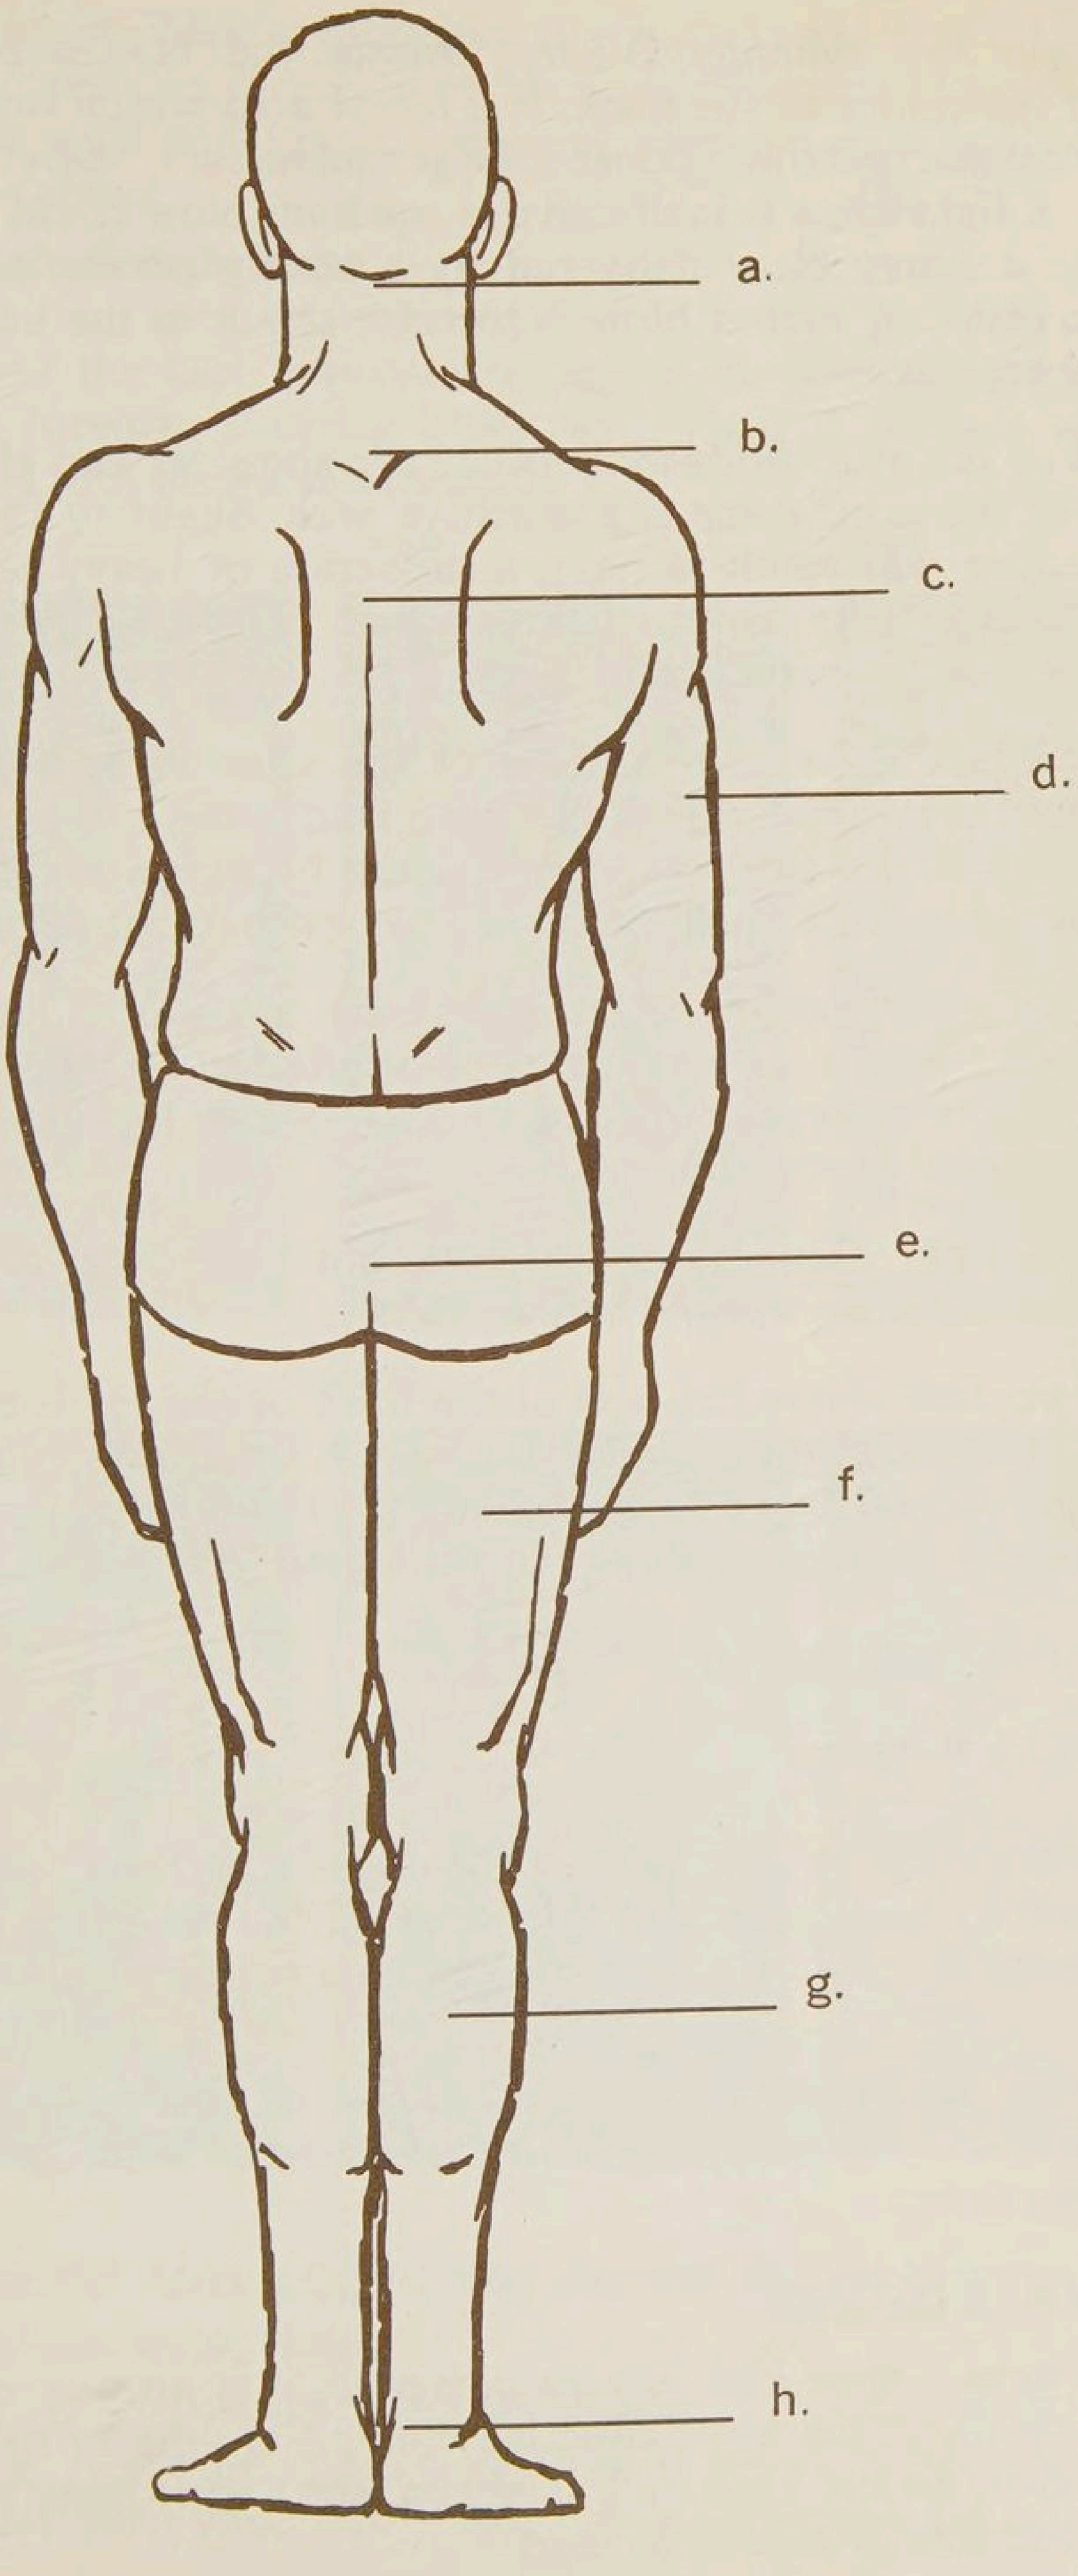
g. *Inside of thigh:* There are two striking areas on the inside of the thigh — one is about one-third of the way down the leg from the groin area and the other is about one-third of the way up from the knee; both are well toward the inside part of the leg. A light blow is ineffective but a medium blow will cause enough pain to make him limp and a heavy blow could temporarily immobilize the leg or cause a charley horse. There is very little likelihood of serious or permanent injury.

h. *Ankle bone:* The round bone at the outside and inside of the ankle is a very sensitive area. The target point is on the tip of the bone and even a light kick will result in a great deal of pain. A medium or heavy blow causes intense pain; unless a blow of great force is delivered, there is not much chance of injury.

Rear

a. *Base of the skull:* This is not a practical target area even though it is a favorite of movie fight scenes. Do not believe that a small, slight person can "chop" or slash down onto the back of a big heavy brute and put him out of commission. Not so. The drawback of this as a target area is that there is hardly anything between a totally ineffective blow and a possibly paralyzing one. A short person has trouble reaching up for an effective blow; a slight person cannot deliver enough power to make the blow work; a strong person could dislocate the vertebra and cause permanent paralysis.

b. *7th vertebra:* There is very little muscle structure to protect this area (the prominent vertebra just below the base of the neck) but there is no middle ground between an ineffective or an injurious blow. An additional impediment to this as a useful target area is the fact that it must be struck with exact precision, not easy when your adversary is clothed.



a.
b.
c.
d.
e.
f.
g.
h.

c. *Between the shoulder blades:* Where the blades begin to spread, in the center of the back, is a target area which is not useful for a smaller person against a larger adversary, therefore not practical. A light blow is ineffective; a medium blow could stun an adversary; a heavy blow delivered by a strong person could be fatal. The result of such a blow is to refer shock to the heart and other vital organs.

d. *Back of the arm:* Midway between the shoulder and elbow, at the back of the arm, there is a sensitive area. Slight or moderate finger pressure will result in pain; a moderate or heavy blow can numb or temporarily immobilize the arm. There is hardly any danger of serious or permanent injury.

e. *Coccyx (tail bone):* At the base of the spine there is a group of bones and nerve endings which make it of some value as a target area, limited by the fact that a slight blow is ineffective. A medium to heavy kick could cause serious, permanent injury.

f. *Back of the upper leg:* Almost directly in the middle of the back of the leg is an area which cannot be affected by a light blow, but a medium or heavy blow could immobilize the leg temporarily without danger of serious injury.

g. *Calf:* A light blow is not effective, but a medium or heavy kick could immobilize without serious injury.

h. *Tendon:* Just above the heel at the back of the leg is the sensitive area known as the Achilles tendon. A light blow is ineffective; a medium blow can cause great pain; a heavy blow can result in a torn tendon, making it difficult or impossible to walk.

KICKING DEFENSES

Toe Kick Defense

231. This technique can be considered as a defense and as a counter-technique, depending on the timing. As you detect the low toe kick being started, draw your knee up and turn your foot to the side.

232. As the kick is delivered, use the side of your foot to kick-block his shin. After stopping his kick, continue with additional kicks, if necessary.

Knee Kick Defense

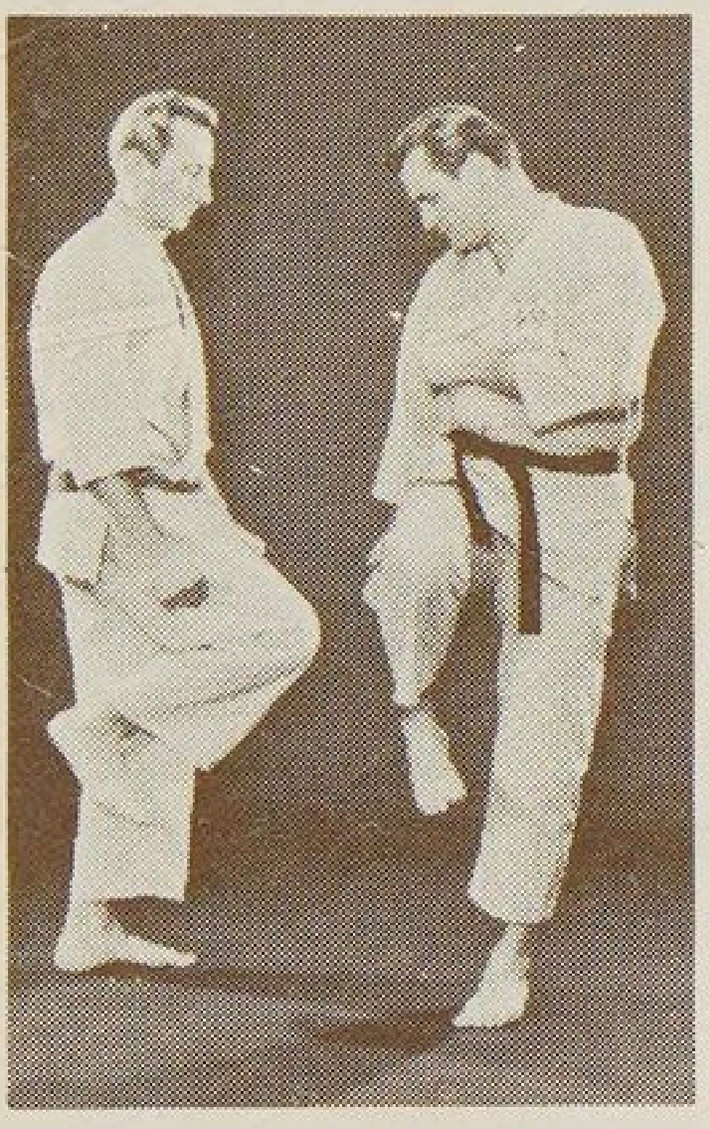
233. Because a knee kick is very powerful, it is unwise to try to block or oppose it; the most effective method is a parrying or deflecting action. As the knee kick is begun, shift your body back as you turn your side to offer less target.

234. As the kick approaches, use both hands in a thrusting motion to divert the direction of his kick. This should place him in a very awkward position; if necessary continue with additional hand and foot blows.

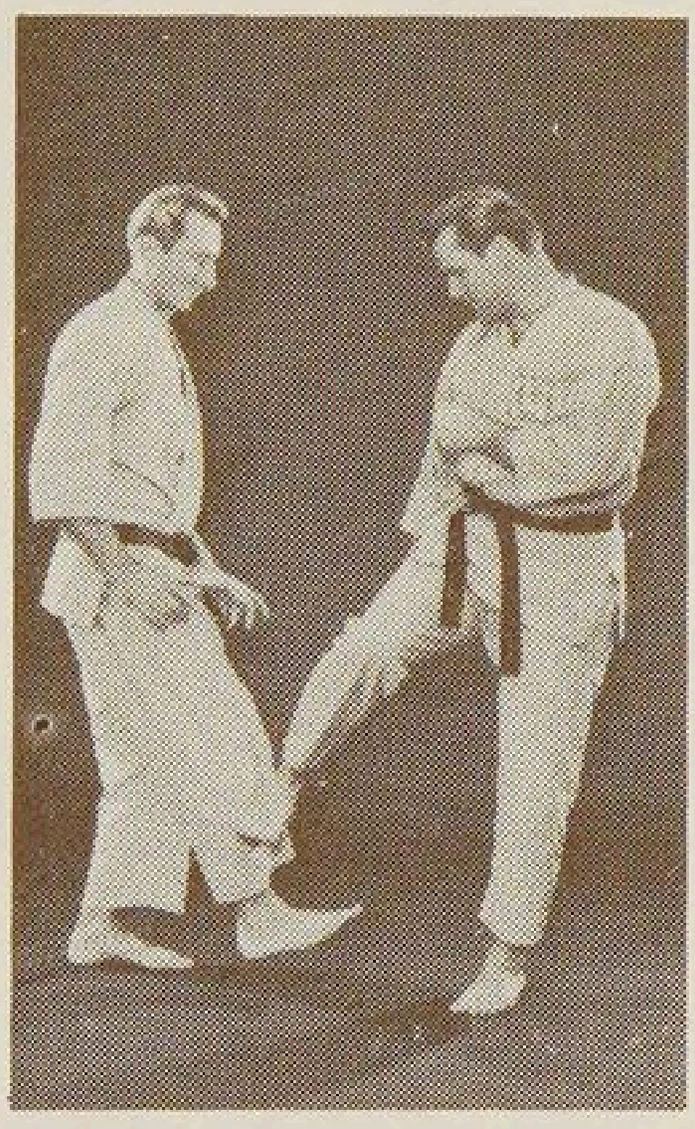
High Kick Defense

235. As the kick approaches, deflect the direction of his leg by using a forearm slashing block with vigor. Continue with other hand and foot blows, if necessary.

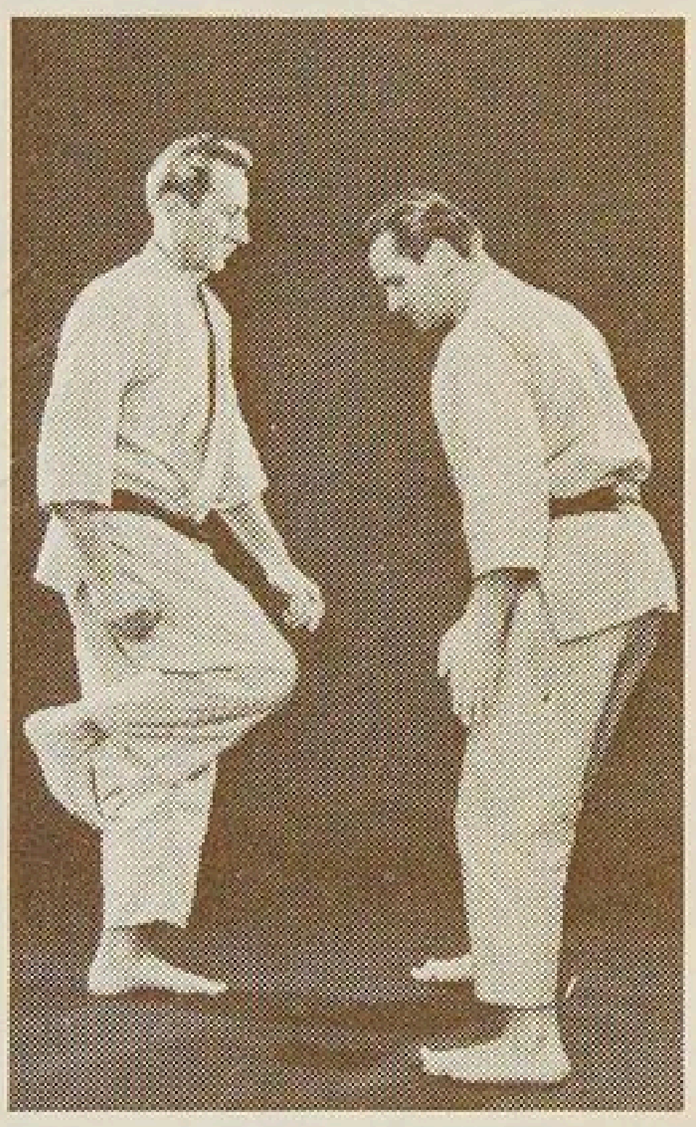
231



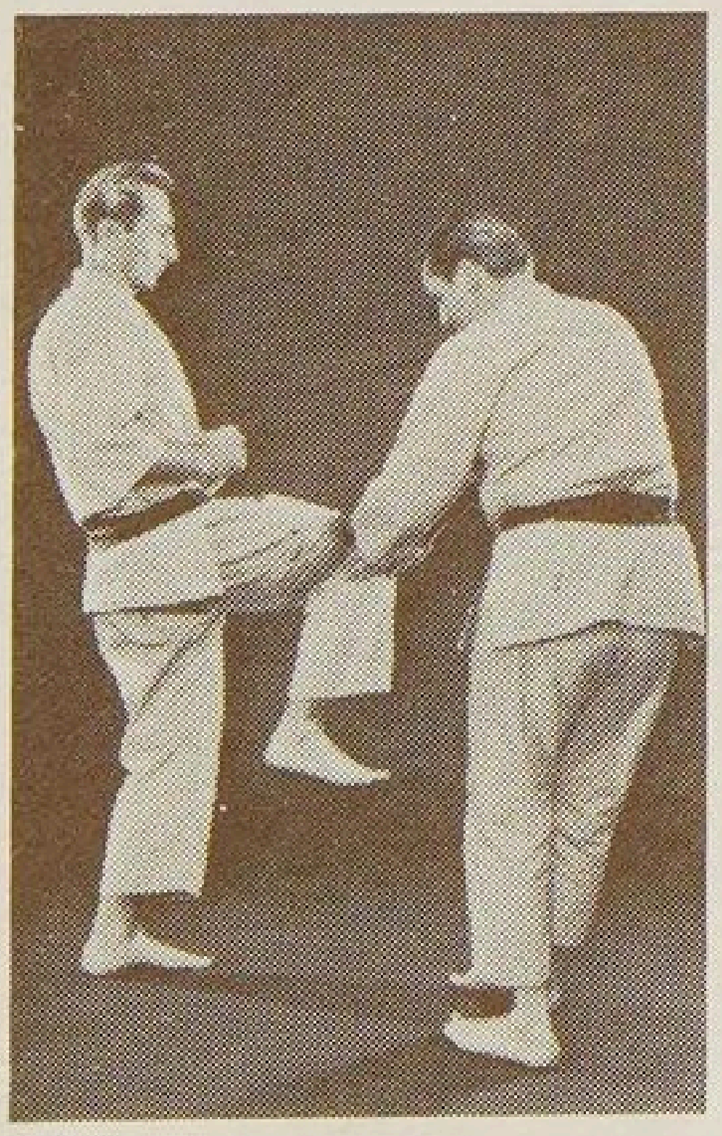
232



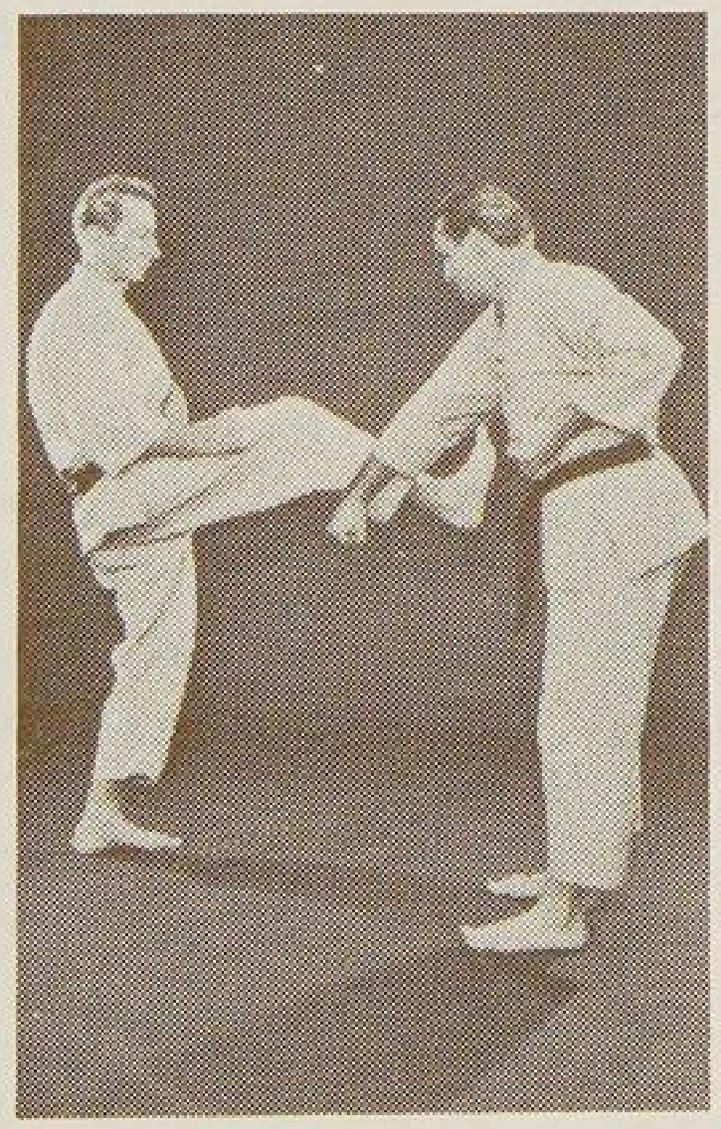
233



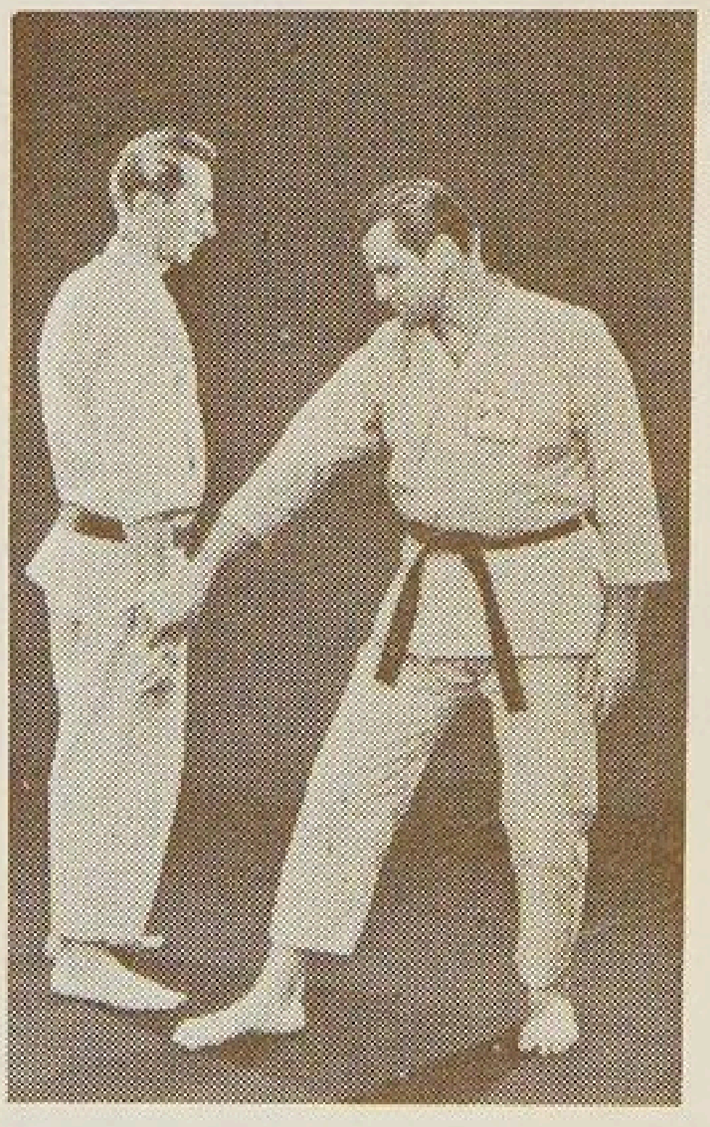
234



235



236



HOLDS AND LOCKS (for Formal Demonstration)

Second Wrist Hold

236. Left partner offers no resistance as you take a step forward with your right foot to his right side, at the same time gripping his right hand with your right hand, using an unnatural grip.

237. Take another step with your left foot as you grip his held hand with your left hand, unnatural grip, pushing his arm back as you grip.

238, 239. Turning clockwise, pivot around toward his rear, raising his arm as you turn. Complete your turn to place yourself directly behind him, assuming a T-position. Apply pressure by bending his wrist and turning his arm clockwise. Additional pressure can be applied by putting your body weight into the action.

Under Arm Lock

240. Partner at right offers no resistance as you grip his right wrist with your left hand, using an unnatural grip.

241. Turning clockwise, step in with your left foot, locking your hip into his side; place your right palm at the back of his captured hand.

242. Pull his arm up under your left arm and lock your left upper arm against his captured arm; pressure is applied by lowering yourself slightly as you raise his captured arm over toward your left shoulder as you bend his wrist.

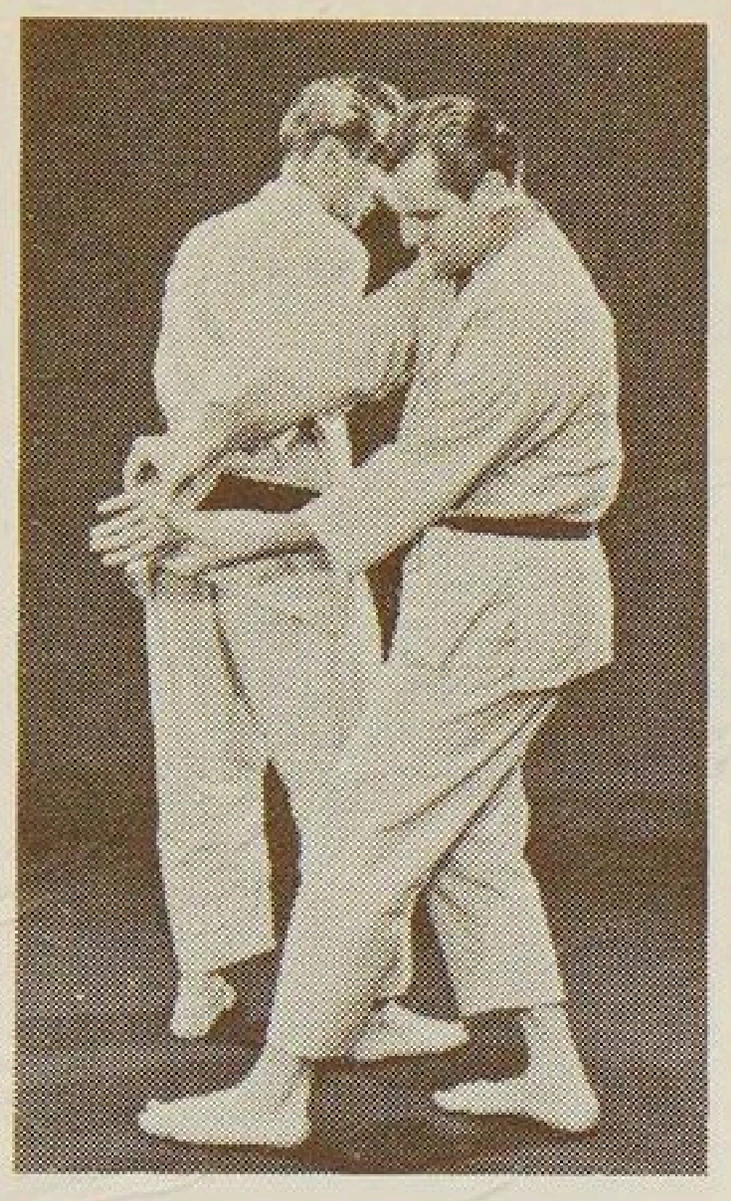
Straight-Up Arm Lock

243. Partner at right offers no resistance as you take a step in with your left foot and grip his right wrist with your left hand in a natural grip.

244. Lean forward with your upper body; with your right hand reach over and around his captured arm to grip your own left wrist with your right hand.

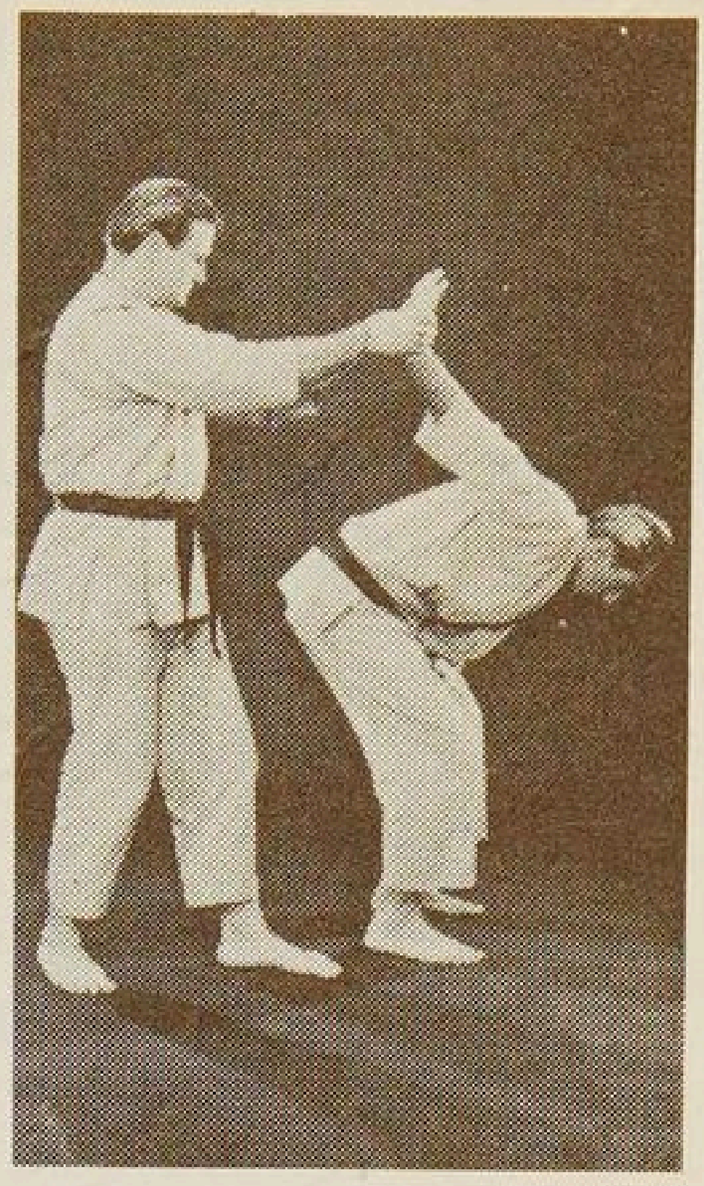
245. With both your arms, raise his captured arm straight up; clamp his raised arm into your chest with your right arm as you lower yourself slightly and lean in the direction of his head.

237

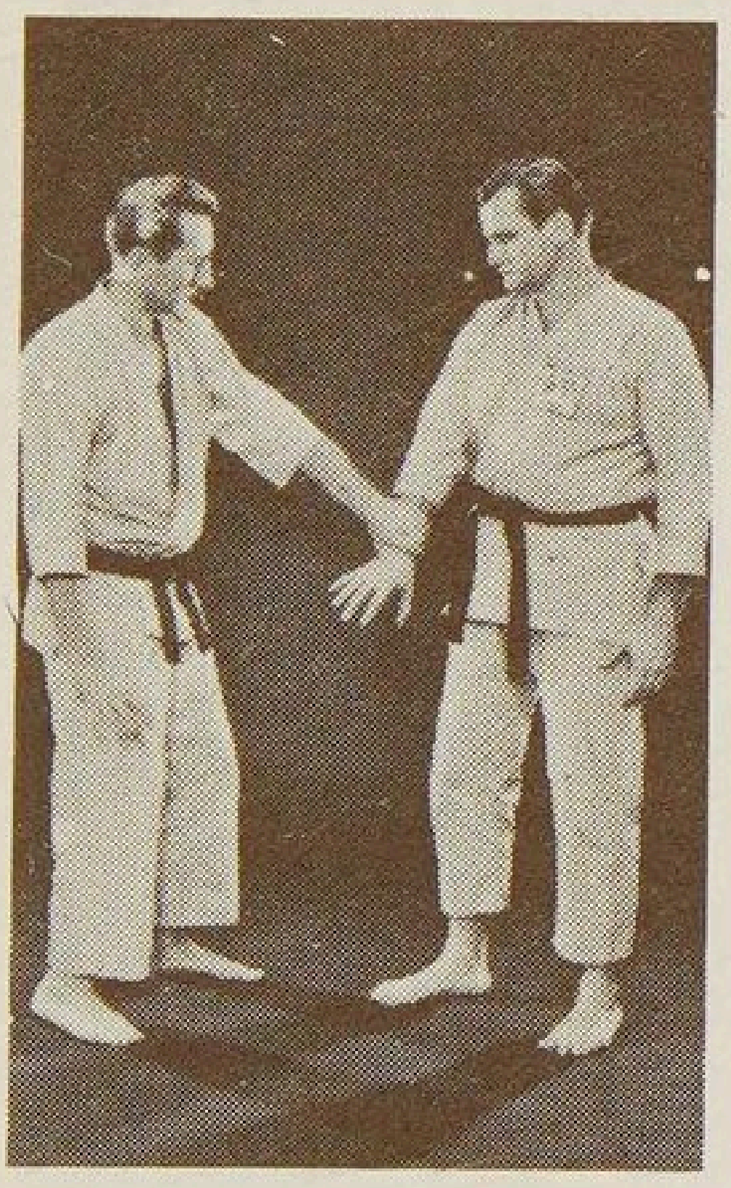


238

239

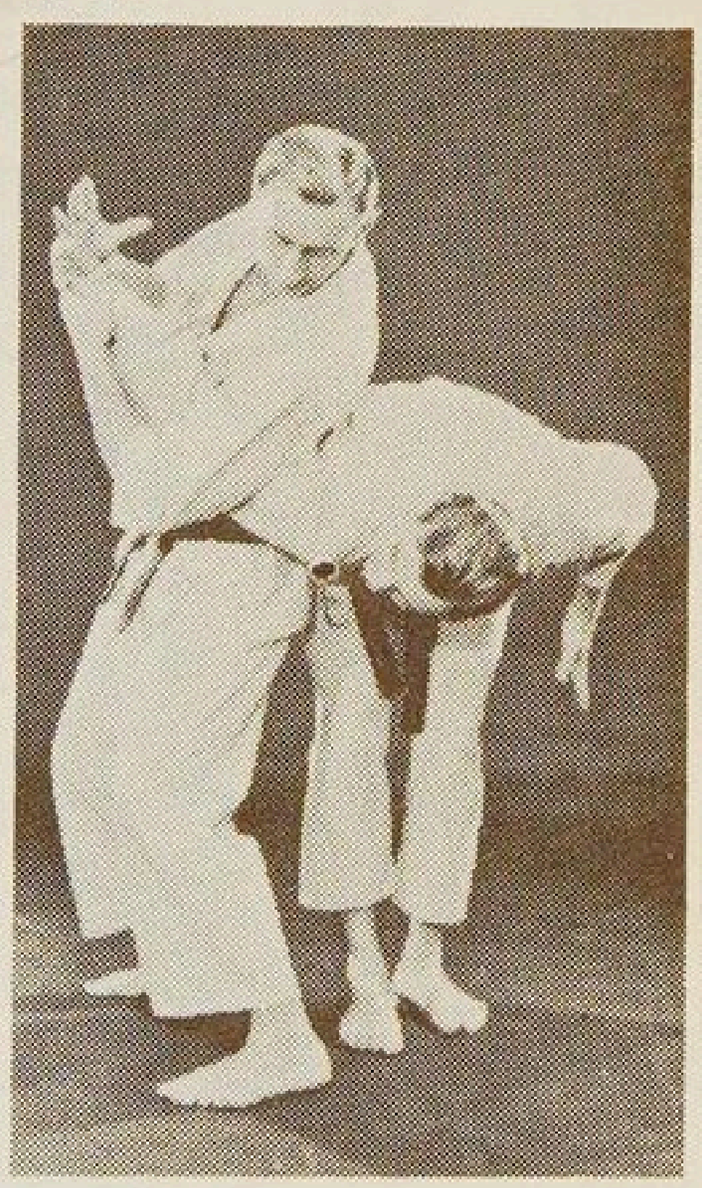


240

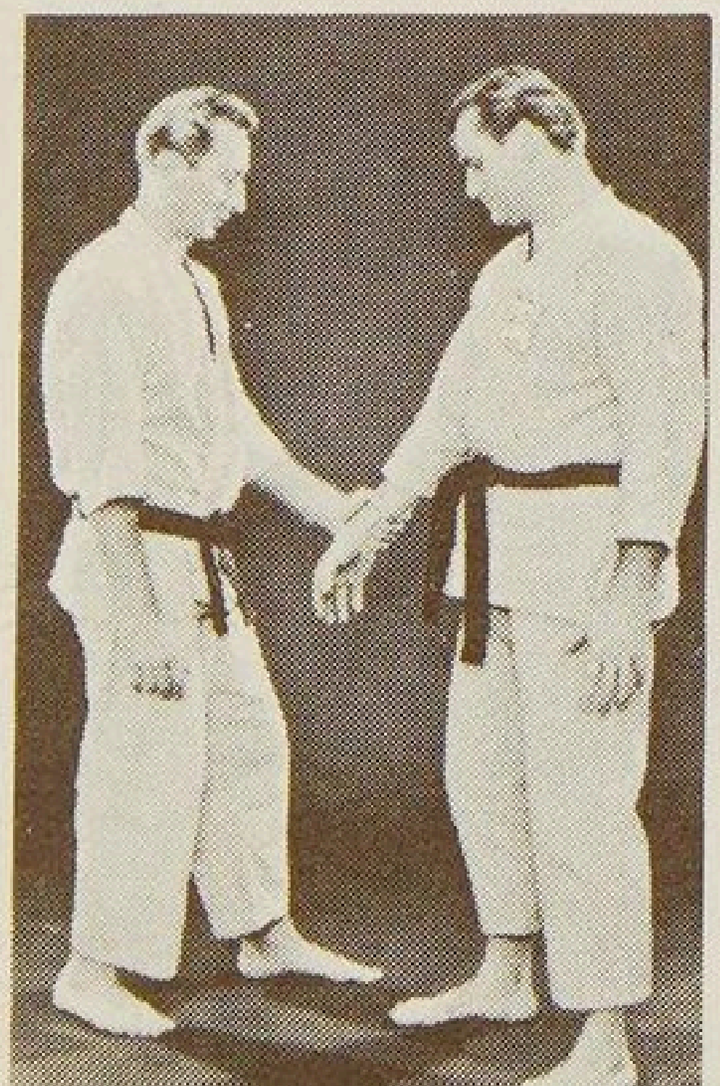


241

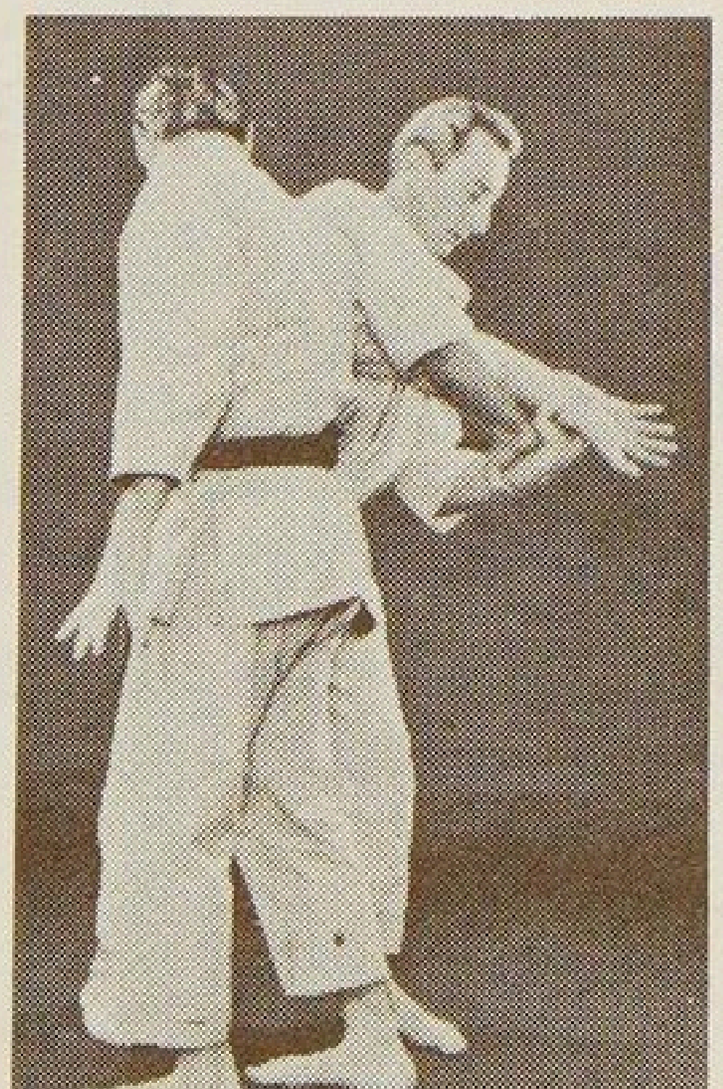
242



243



244



245

Choke Hold: Knuckle in the Back

246. Your partner on the left offers no resistance as you step cross-body with your right foot as you grip cloth high at his right shoulder with your thumb inside the jacket.

247. As you place your left hand onto the back of his right shoulder, step around behind him with your left foot.

248. Complete your turn by stepping around with your right foot into a T-position, maintaining pressure at his right shoulder as you turn.

249. With your left hand, reach over and through his left arm, placing your knuckles into the center of his back. Pressure is applied by pushing forward with your knuckles as you lever back with your right arm across the windpipe. Observe safety rules carefully; simulate windpipe pressure and release quickly upon tapping signal.

Bent Arm Restraining Hold

250. Left partner offers no resistance as you step cross-body with your right foot as you grip cloth with your right hand at his right upper arm, unnatural grip.

251. Take a step forward with your left foot as you push his right wrist back with your left hand.

252. Pivot on the balls of your feet so that you are turned to his side as you slide your left arm under his held arm.

253. Reach over his held arm with your left hand and grip cloth at his right elbow as you step back into a T-position with your right foot.

254. Hold is secured by letting go with your right hand and regripping at his collar. Pressure is applied by raising your left elbow as you pull back at his collar.

246

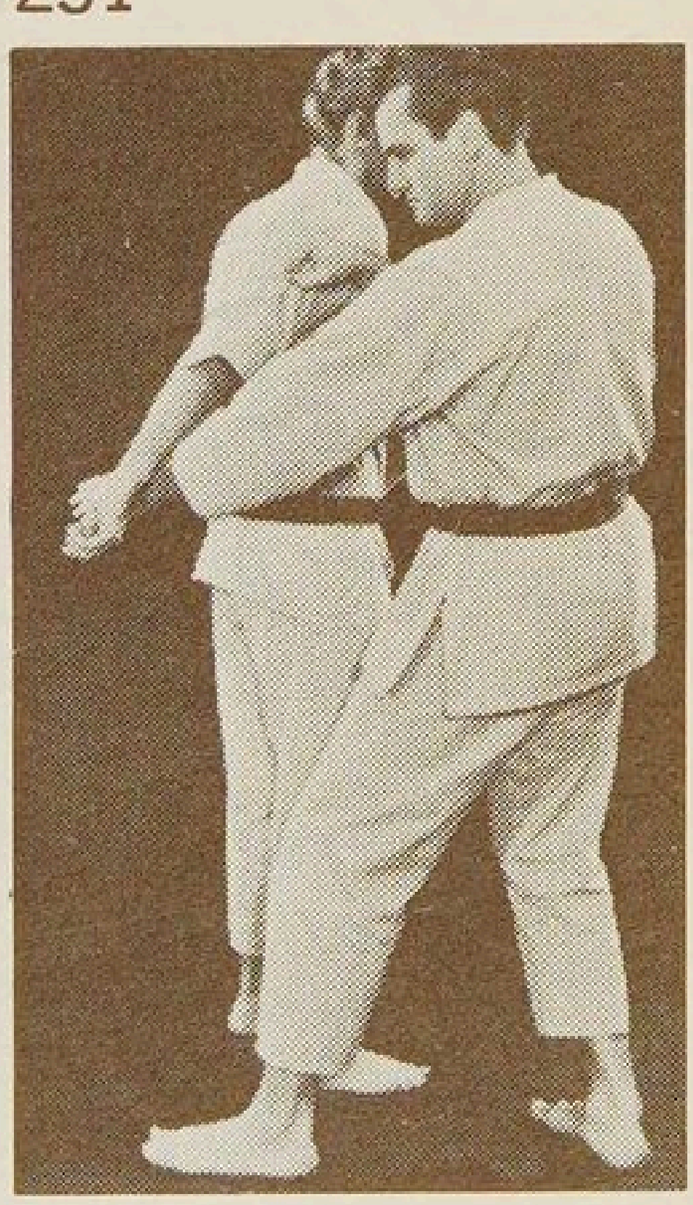
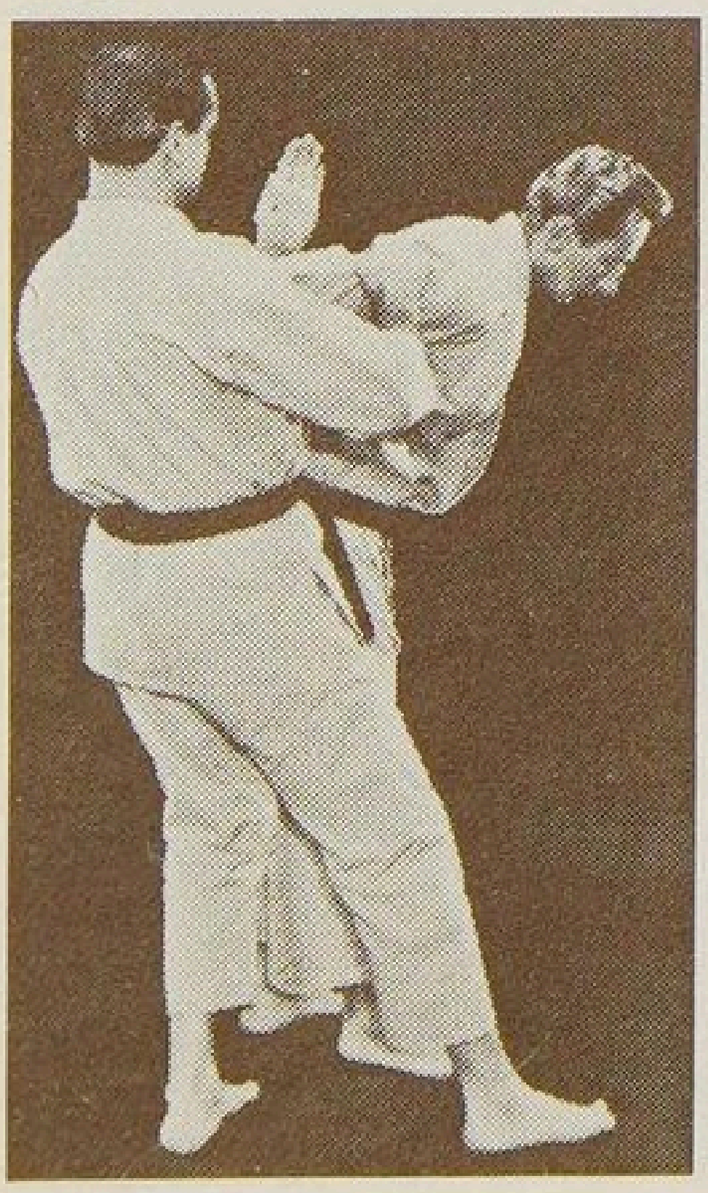
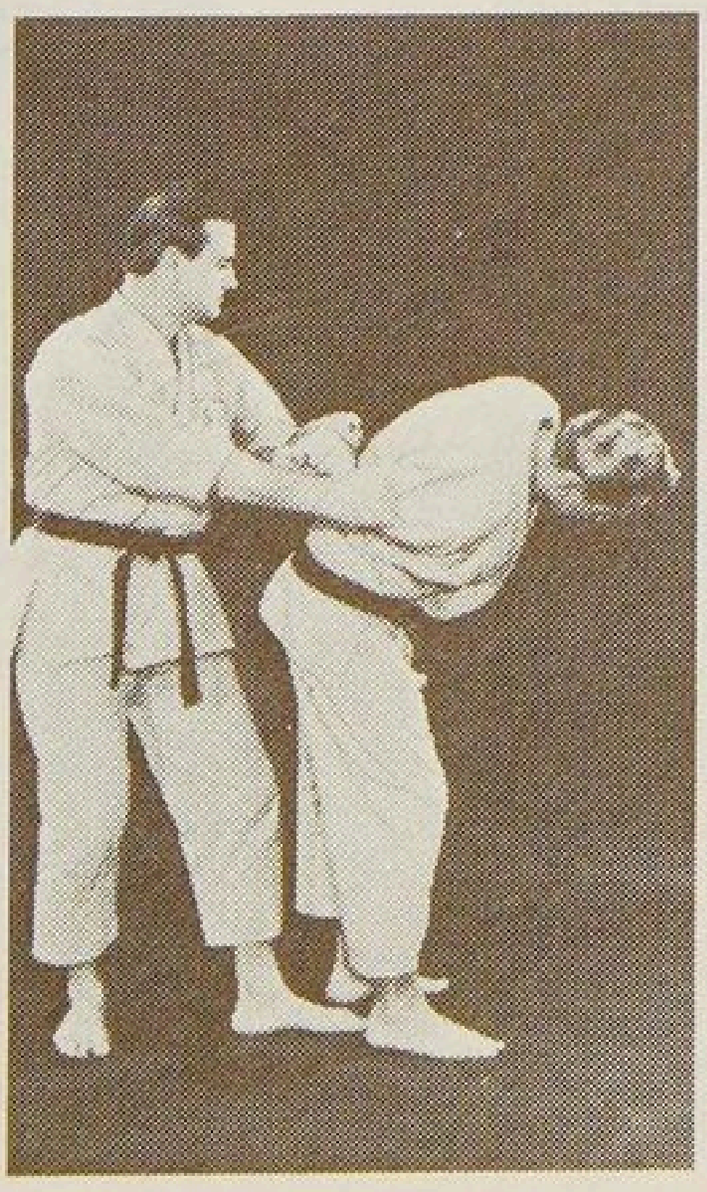
251



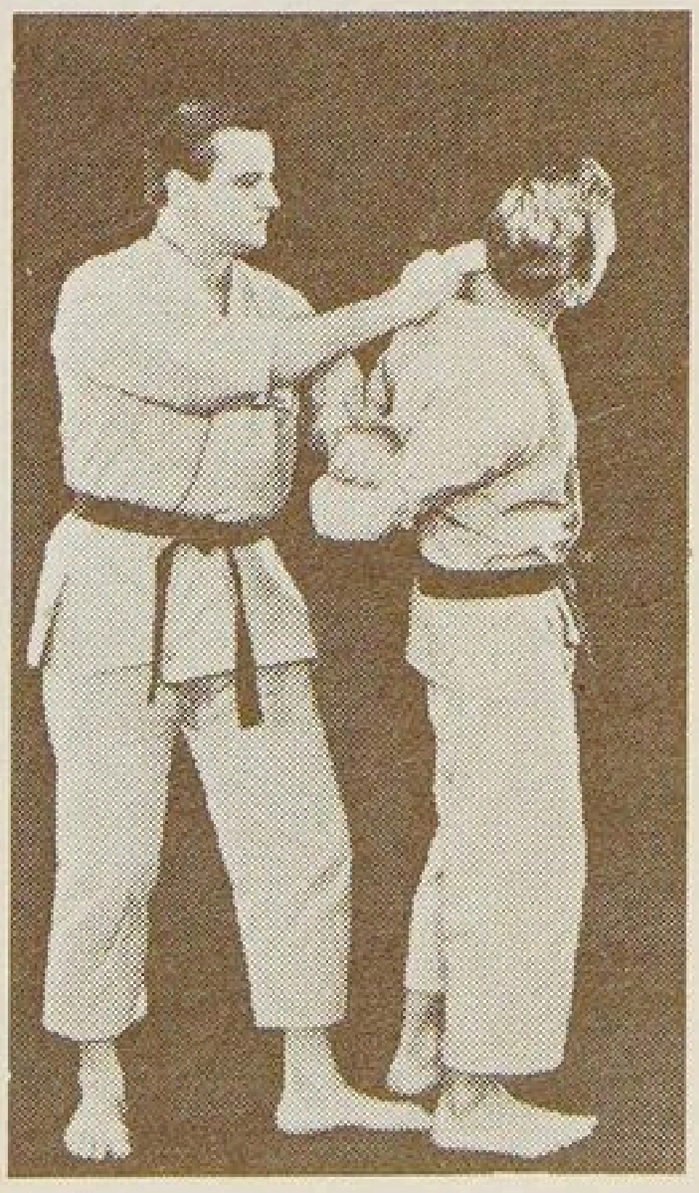
252



253



254



USES OF HOLDS AND LOCKS:
Showing Attack, Defense, and Takedown

Second Wrist Hold

255. As left partner simulates attack, gripping with unnatural grip at your lapel . . .

256. . . . you slash at his forearm nerve as you begin wrist hold #2.

257, 258. Apply the hold and place him on the ground.

Under Arm Lock

259. Left partner simulates hair pulling.

260. Clamp your hands firmly on top of his hand and push toward your head to relieve pain as you step around counter-clockwise and start the lock.

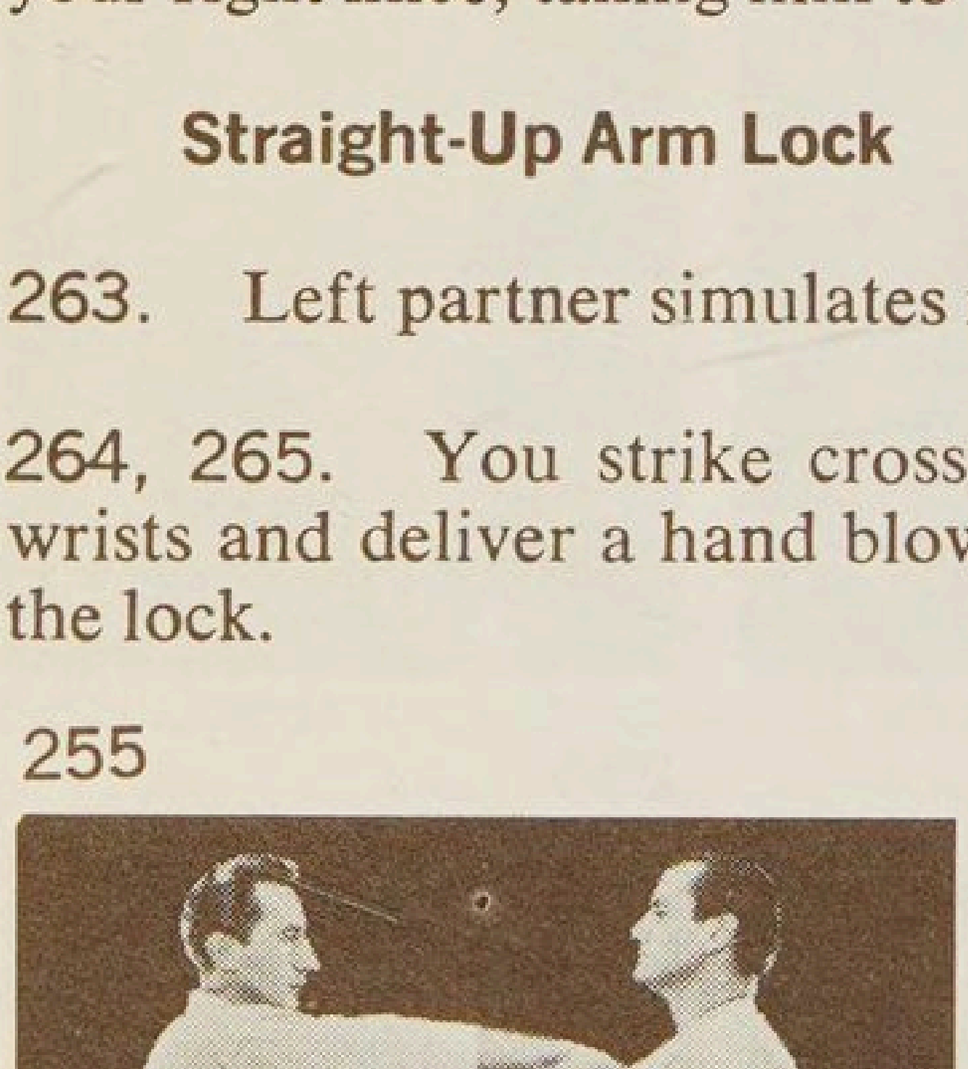
261, 262. Apply the lock and continue by lowering yourself onto your right knee, taking him to the ground.

Straight-Up Arm Lock

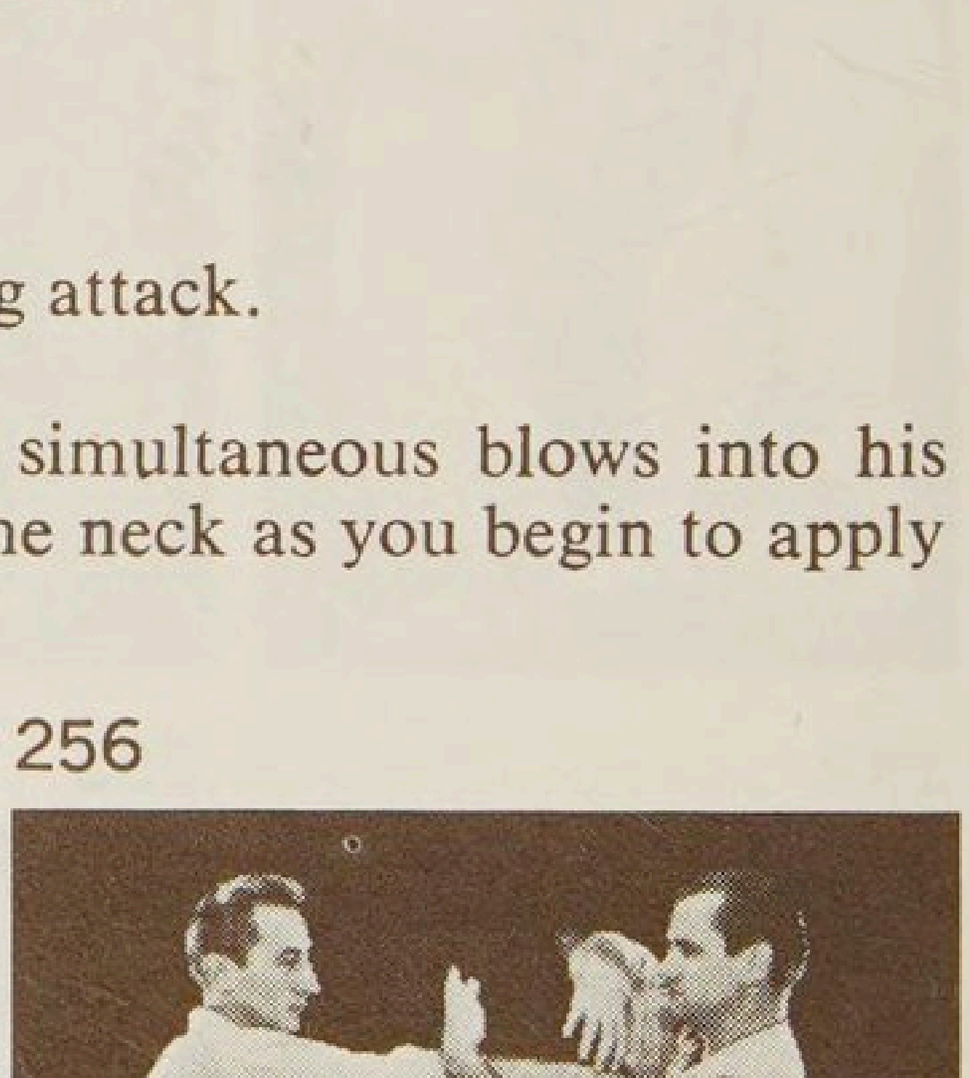
263. Left partner simulates reaching attack.

264, 265. You strike cross-armed simultaneous blows into his wrists and deliver a hand blow into the neck as you begin to apply the lock.

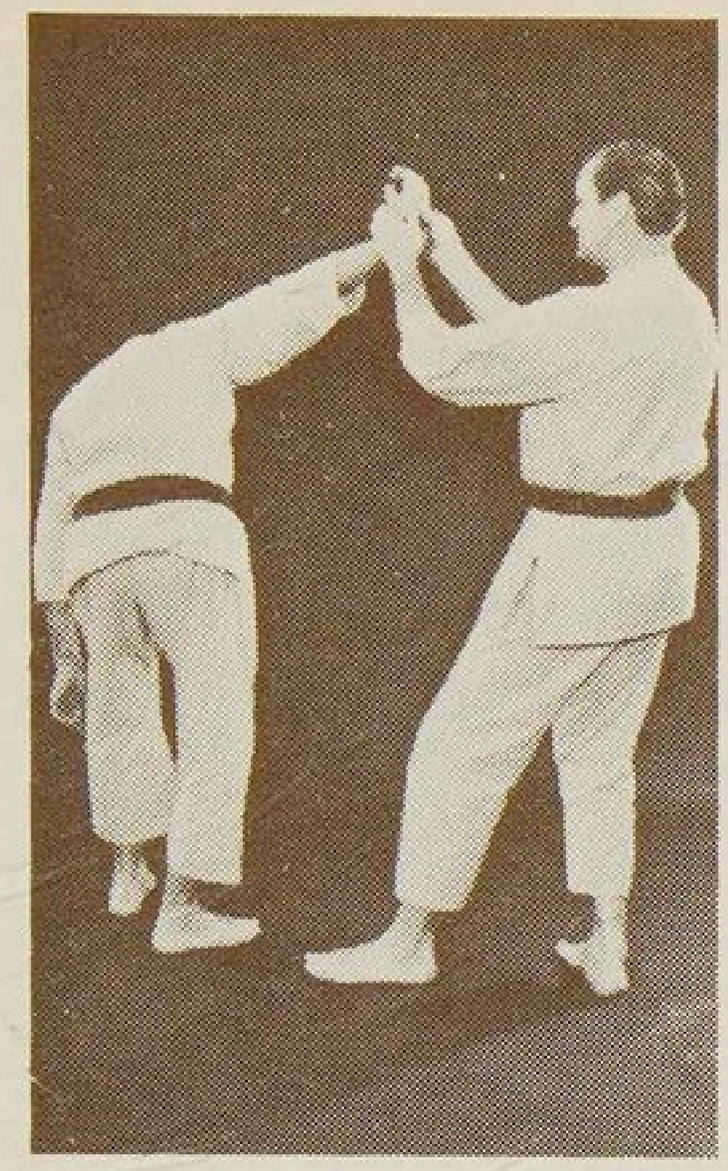
255



256

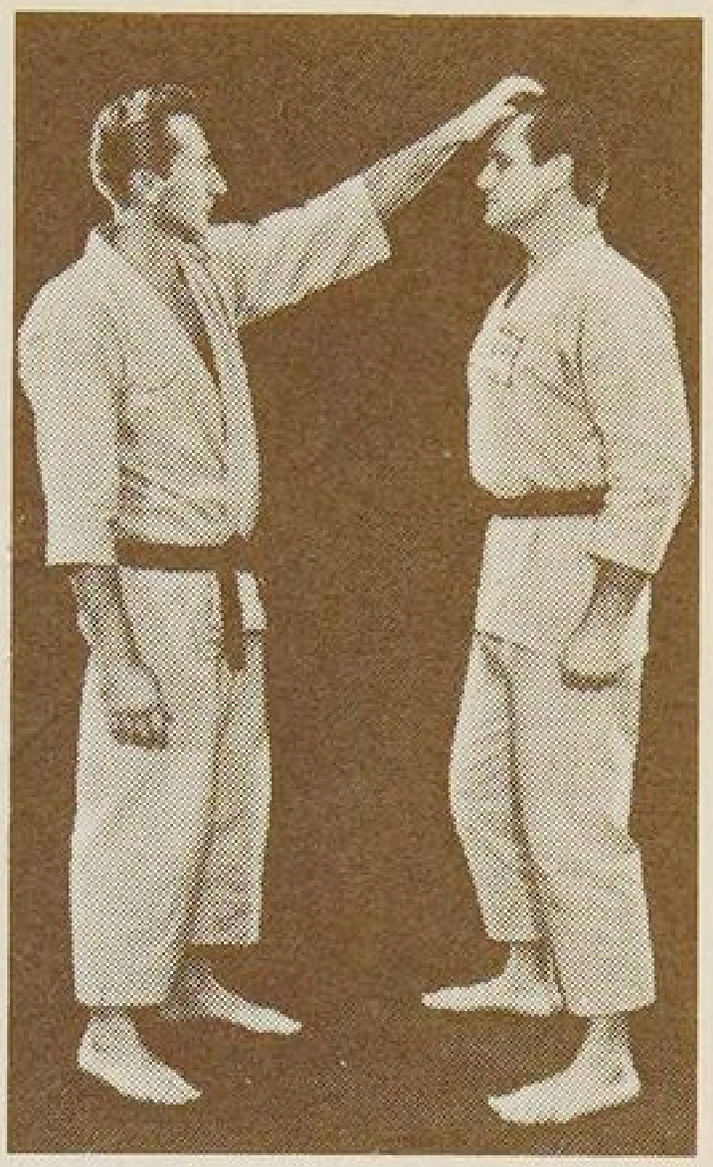


257



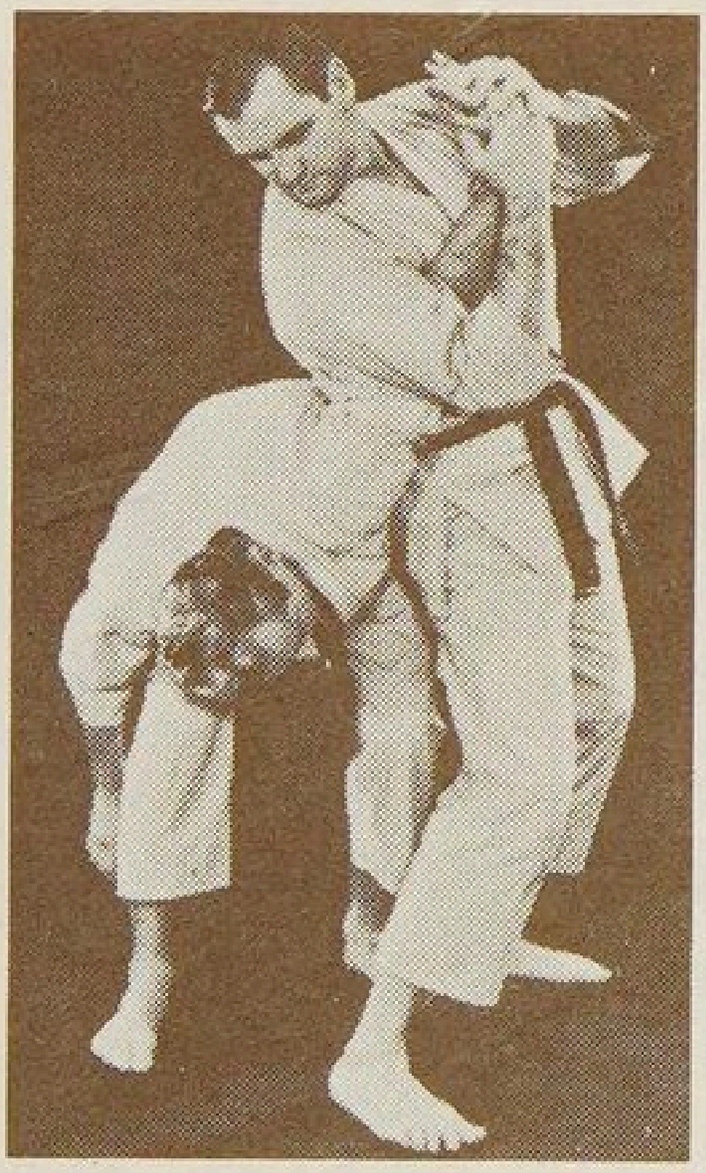
258

259

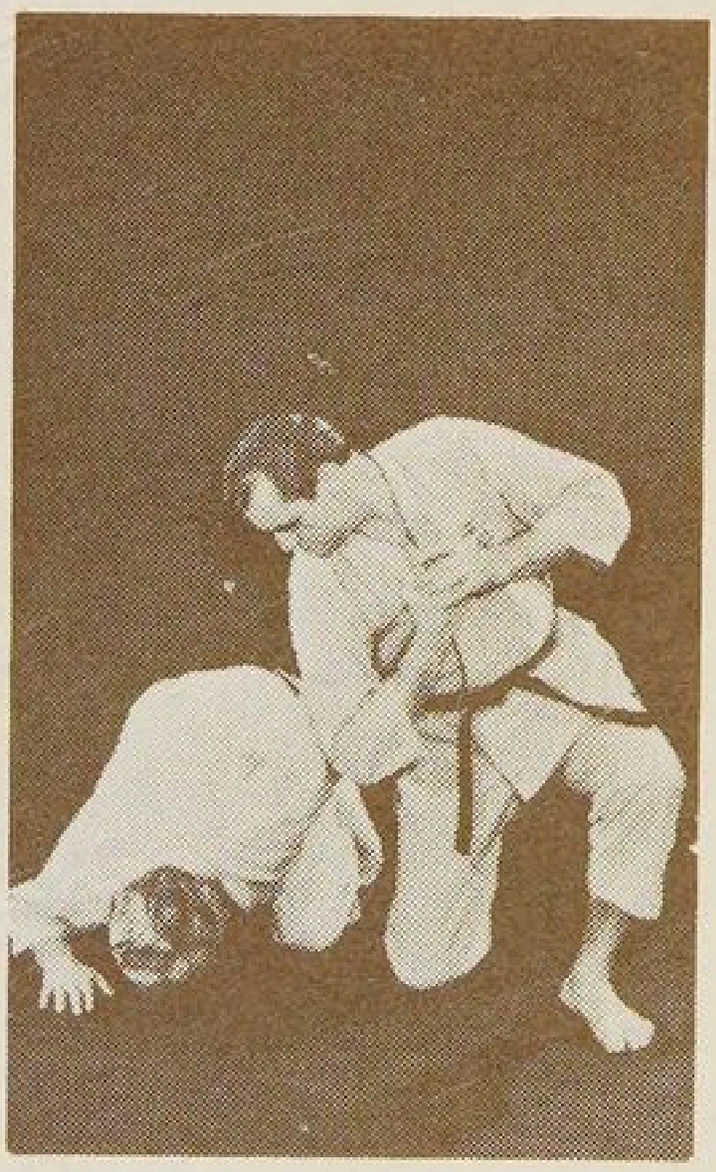


260

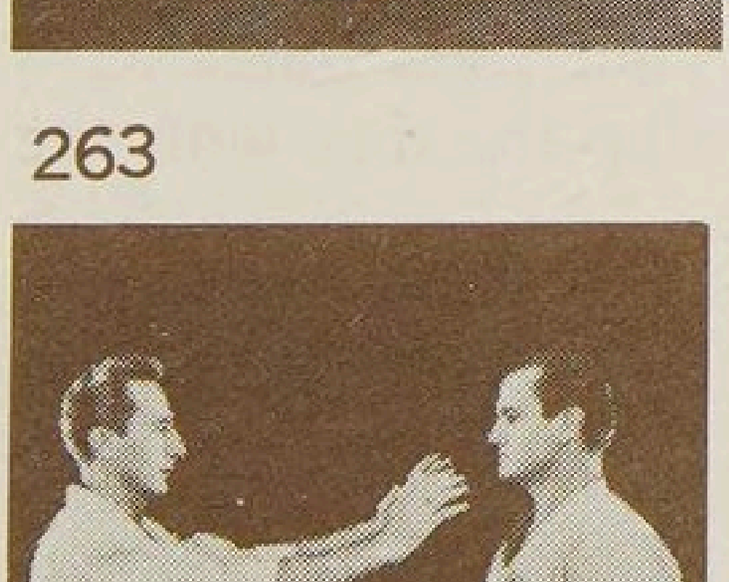
261



262



263



264

265

266, 267. Apply the lock and complete the action by lowering yourself onto your right knee, taking him down to the ground.

Choke Hold: Knuckle in the Back

268. Partner at left simulates reaching attack.

269, 270. Apply choke hold and complete the action by lowering yourself onto your right knee to take him to the ground. Because there is pressure on your partner's throat, observe safety rules carefully, doing the entire action in slow motion, timing your body movements with his to avoid hurting him.

Bent Arm Restraining Hold

271. Left partner simulates reaching attack from the side; you slash his reaching arm . . .

272, 273. . . . and apply the lock from the side and carry through by taking him down onto the ground.

FALLS

Basic Side Roll

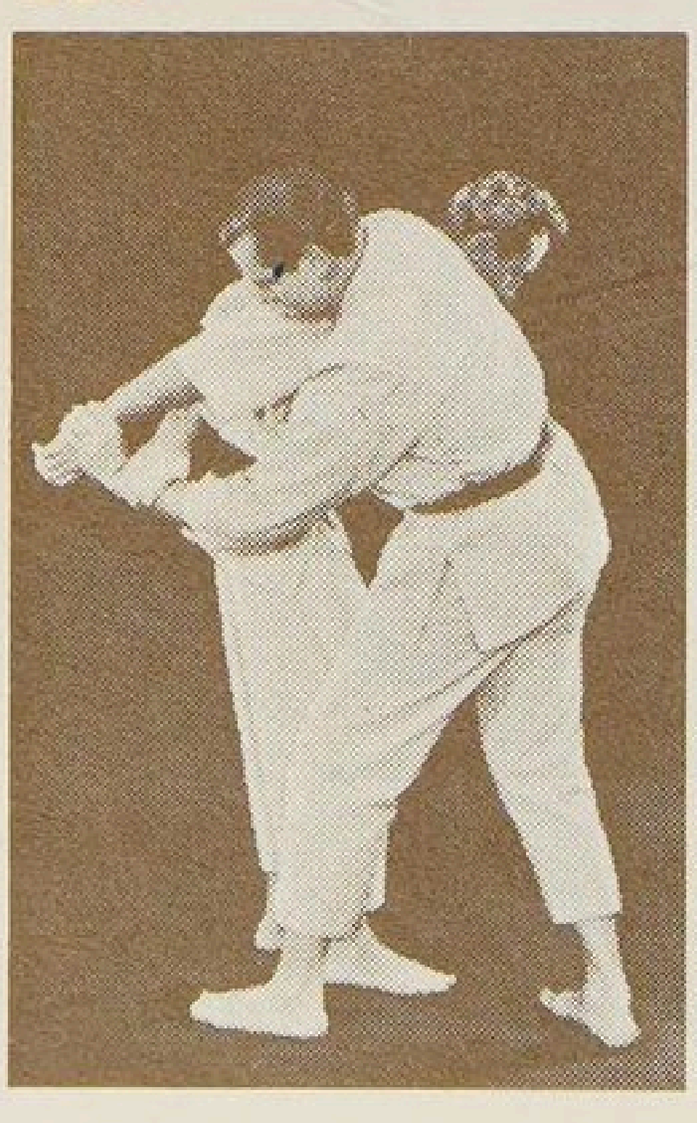
274. Start from standing position, feet about shoulder-width apart. Place your hands on the mat, as shown; your right hand is slightly forward, forming a triangle with your feet; your left hand is directly beneath your head, elbow pointing outward, your fingers pointed at your right foot.

275. Shift weight onto your left foot and raise your right foot so that you begin to topple over your left shoulder.

276. Gently continue the rolling over your left shoulder and across your back, curling your body as you roll.

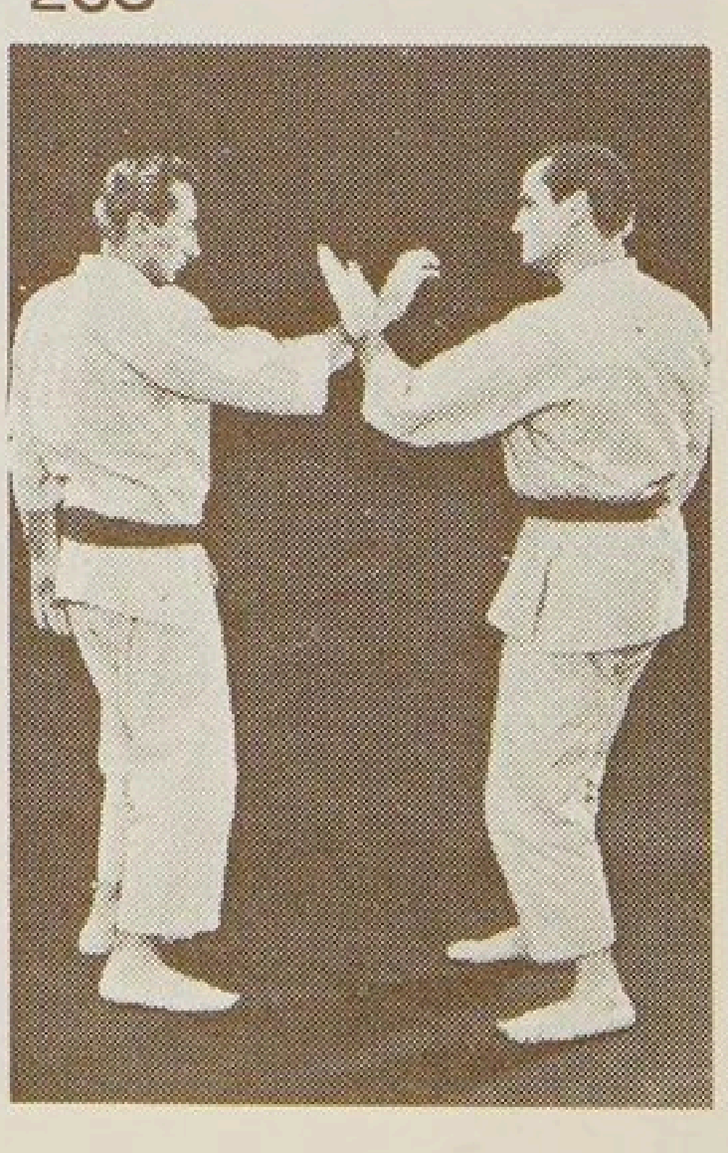
277. Complete the fall on your right side; your right hand slaps the mat vigorously at your right side as you slap the mat with the

266



267

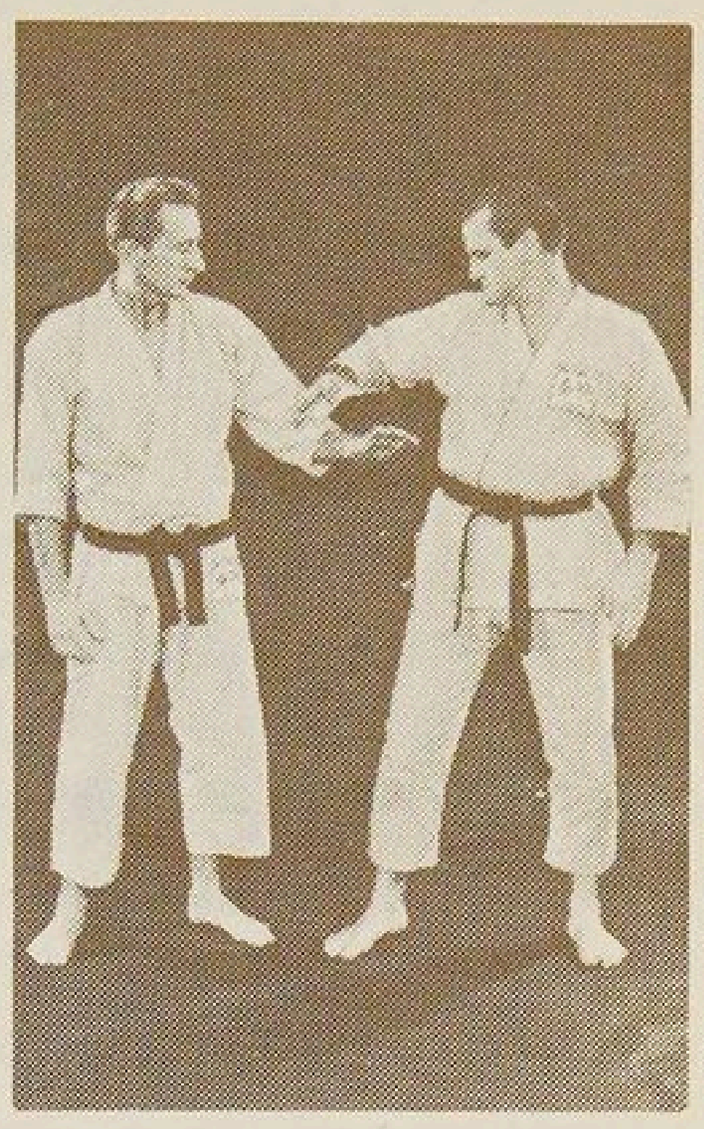
268



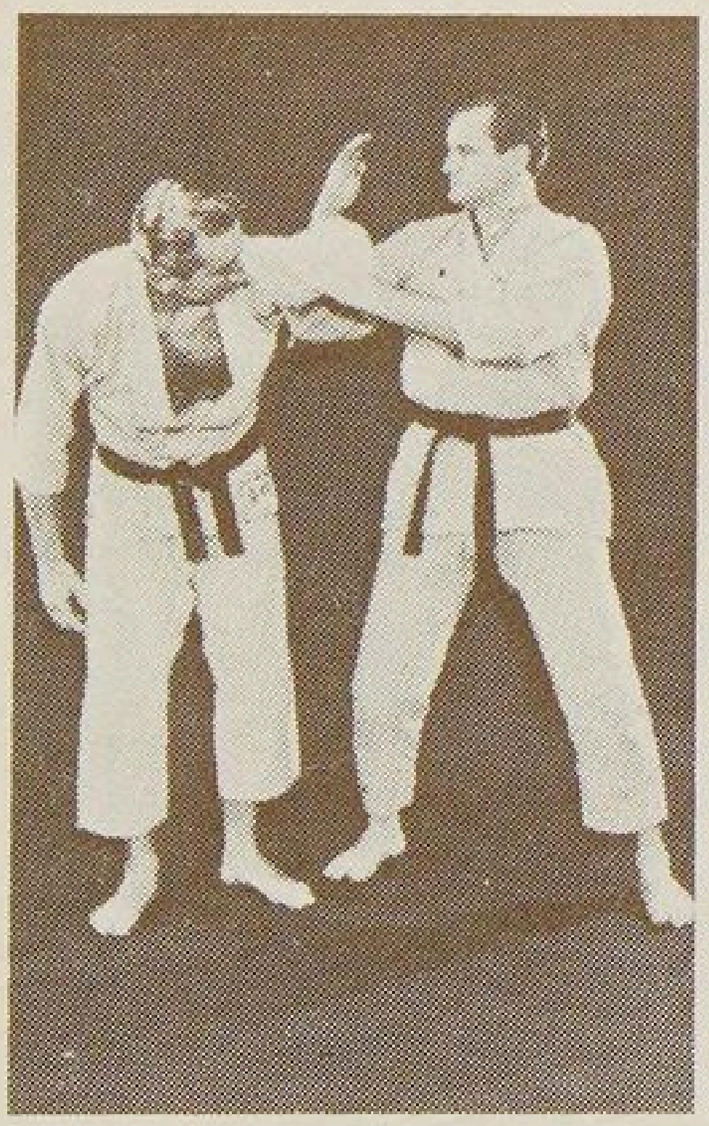
269,

270.

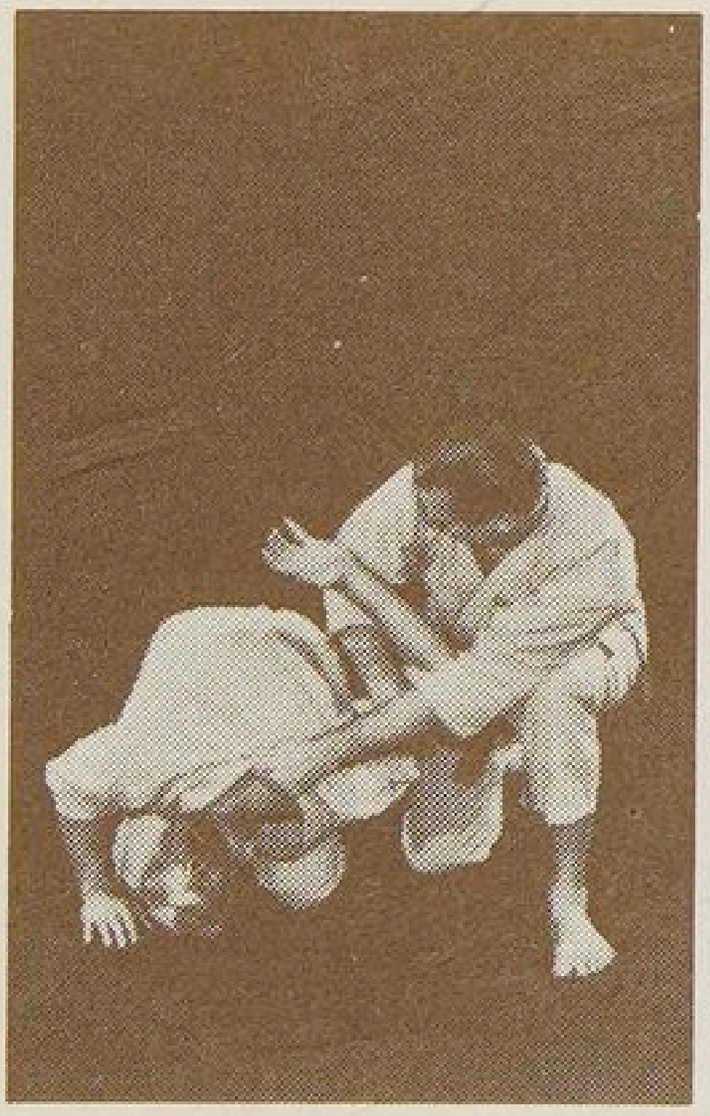
271



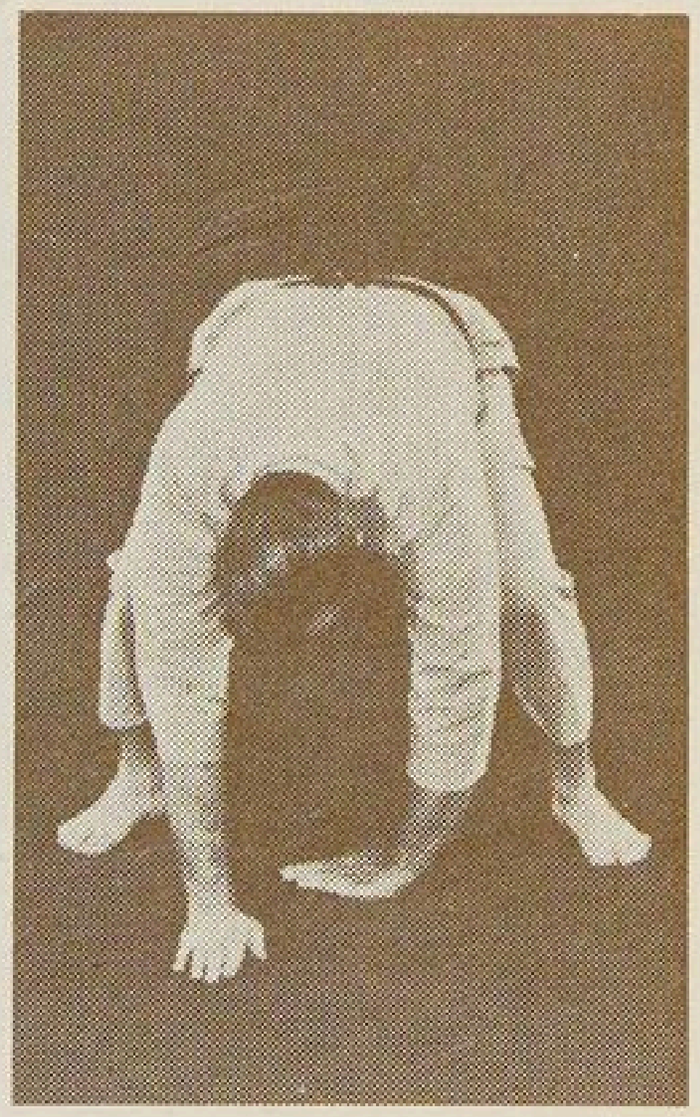
272



273

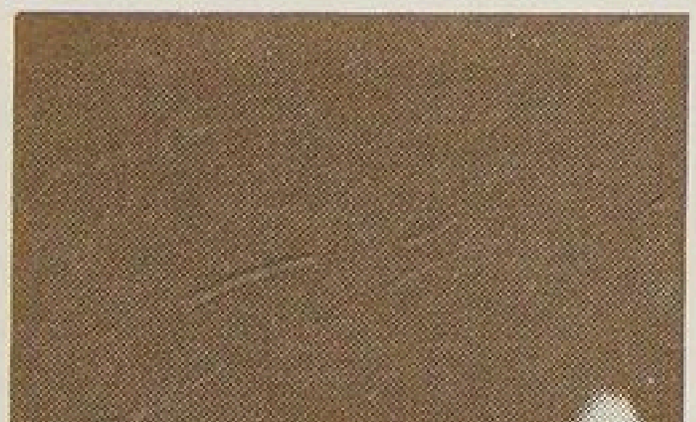


274



275

276



277

bottom of your left foot. Your head does not ever touch the mat. The simultaneous slapping with hand and foot will absorb the greater part of the impact. Your slapping arm is kept fully extended and the slapping foot is crossed over as shown. This fall is basic for other more advanced versions of side falling and it is therefore important that you develop good timing and a forceful slap for proper execution of the fall. You will know when you are doing it correctly because there should be no shoulder-jarring or feeling of internal discomfort. To correct shoulder-jarring, be certain your head is well tucked in and that the line of your fall is diagonal from your left shoulder across your back toward your right hip. To correct feeling of internal jarring, time your slap to absorb impact properly. The perfect slap will occur just a fraction of an instant before the fall is completed.

Practice this fall over your right side by reversing the direction.

• Forward Roll — Staying Down

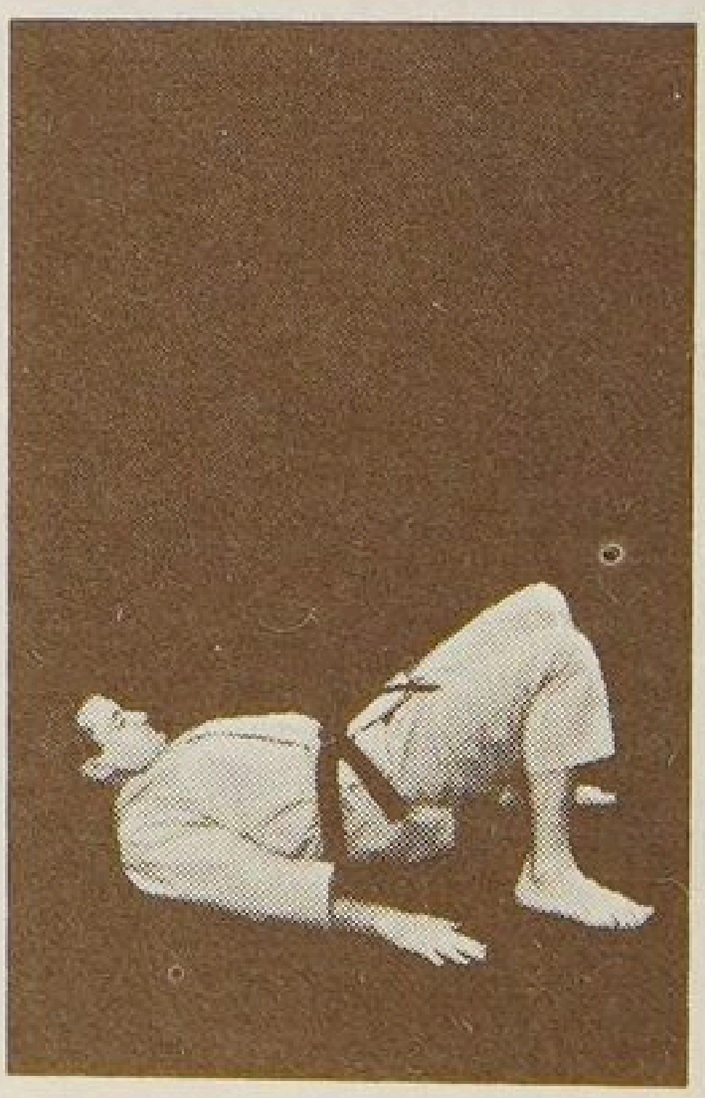
278, 279. With your feet about shoulder-width apart, squat down and place both hands on the mat in front of your feet with fingers pointed outward; shift your weight forward, tuck your head in, lower your shoulders to the mat and begin a gentle, rolling fall forward. Do not thrust or jerk your body into the action.

280. Without allowing your head or buttocks to touch the mat, slap the mat vigorously with both hands and the bottoms of both feet. Your knees are sharply bent, as shown; your arms are fully extended as you slap.

278

279

280



• Forward Roll — Coming Up

281. Fold your arms over your head, stand with feet about shoulder-width apart. Do not interlace your fingers.

282, 283. Squat down as close to the mat as you can and shift your weight forward. As you lose your balance forward, give a little push with your toes to add impetus to the roll, but keep the action smooth.

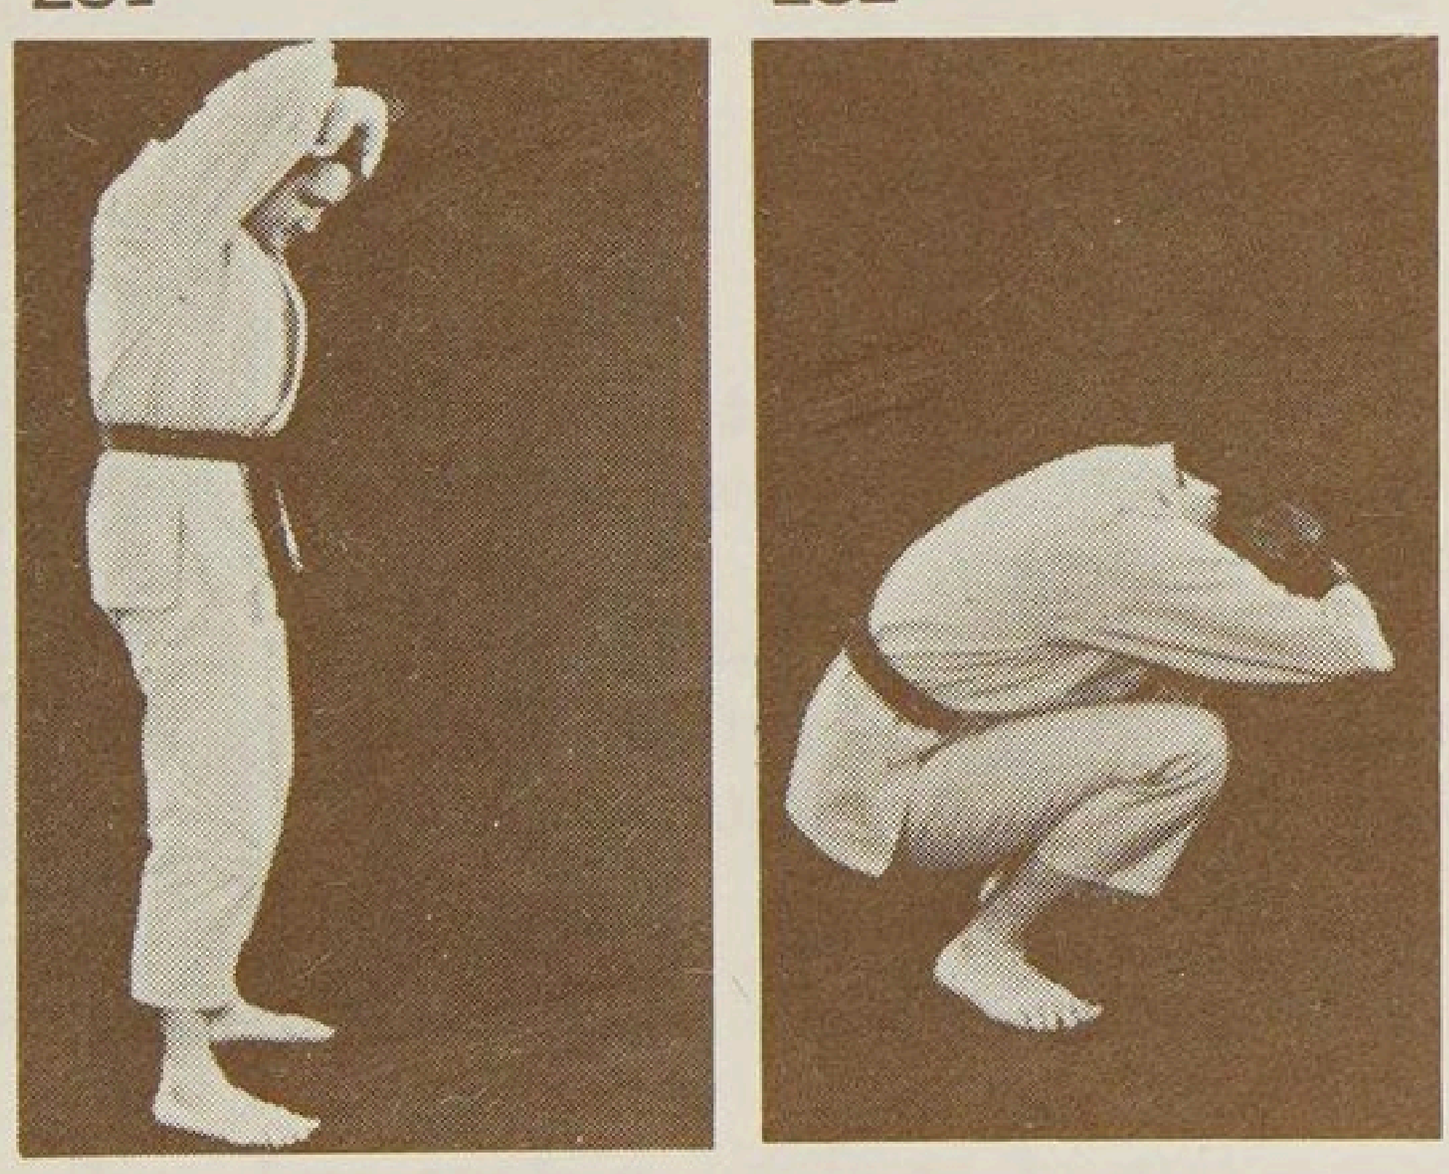
284, 285. As you complete the roll, keep your feet apart and thrust your arms forward to assist you to a standing position.

• Intermediate Side Fall

286. Start facing front. As you take a step to your left side with your left foot, pointing the toe left, swing your right arm back up for rhythm and timing.

281

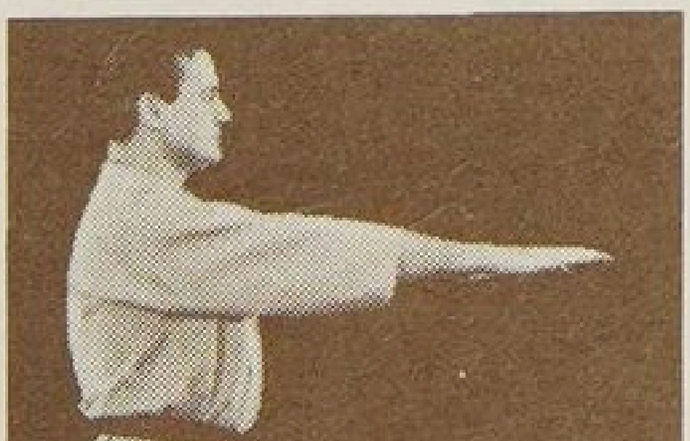
282



283

284

285



286

287, 288. Swinging your right arm forward and up, raise your right leg as shown and lower your body as close to the ground as you can without losing your balance.

289. Just before you let your hip touch the ground, roll smoothly onto your right side; you slap with vigor just before your upper back touches the mat.

290. The finishing position is well onto your right side with both legs up.

Do not thrust or jerk your body into this fall; the aim is to learn smooth, gently rolling action which prevents jarring to any part of your body; your head does not touch the mat at any time.

Practice this fall on both sides, reversing the technique for the left side.

THROWS

For self-defense use, all jukado throws are preceded by action which stops the intended attack and then weakens the adversary to make him vulnerable to the throw. Even when the exact pre-throwing action is not shown, it is assumed that no jukado throw is applied unless preceded by weakening action. For rank tests, pre-throwing action is always part of the demonstration.

Hip Throw

291. After pre-throwing action of blocking, kicking and slashing, step cross-body with your left foot to place it in front of his left foot, with your toe pointed toward him.

292, 293. Pivot on the ball of your left foot turning counter-clockwise as you slide your right arm around his waist; with your left hand grip cloth at his right arm; when you complete the pivot you will be directly in front of him with your feet squarely in front of his feet. Lean your upper body to the left, keeping your feet in place; squat so that your hip is in front of his hip.

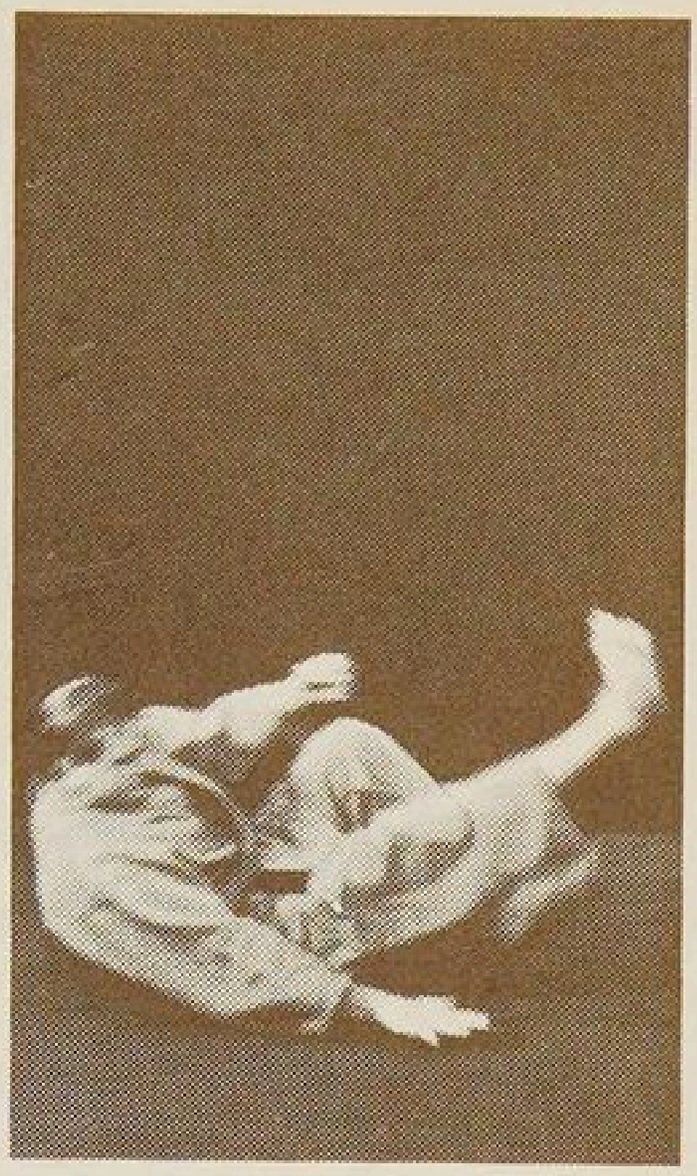
294. Topple him onto your hip by pulling around with your left hand as you carry him over your hip with your right arm.

295. The throw is completed by springing sharply upward with your legs as you twist sharply with both your arms.

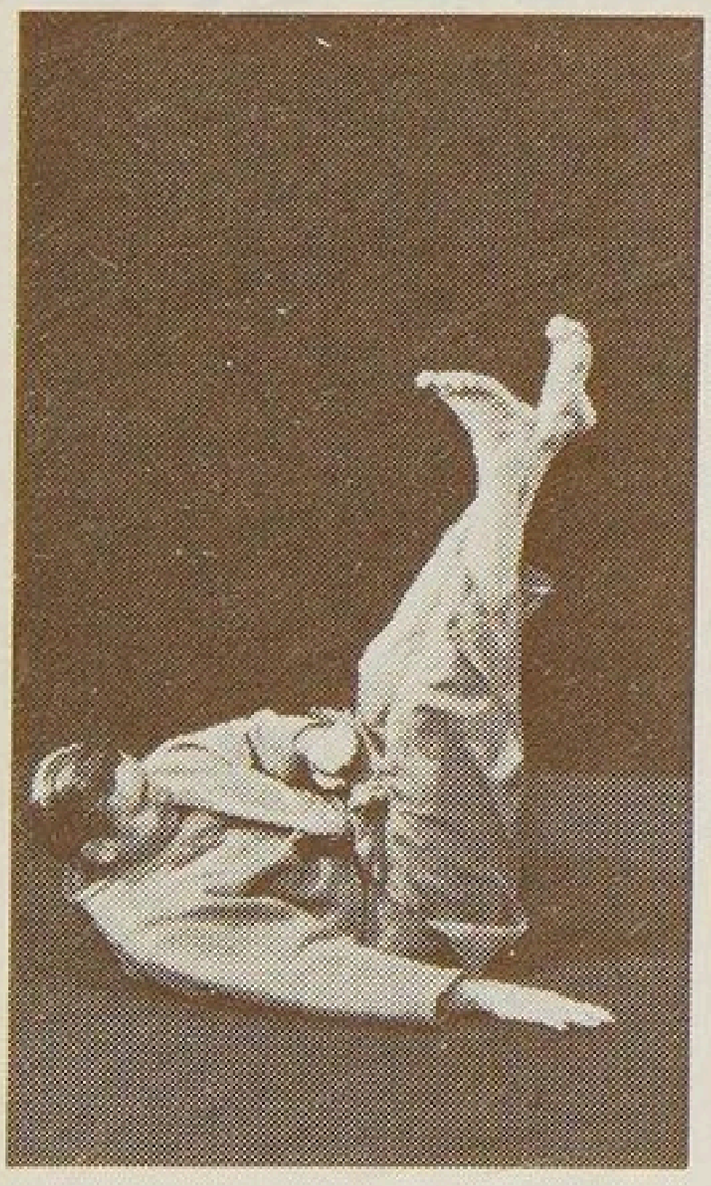
287

288

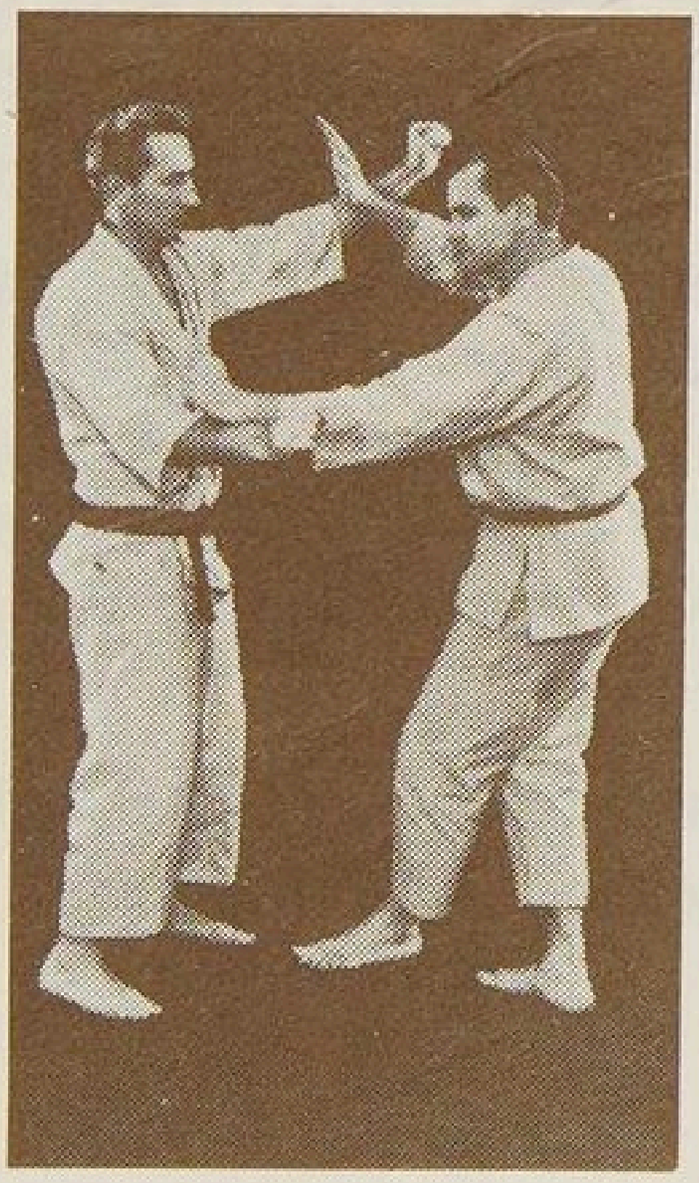
289



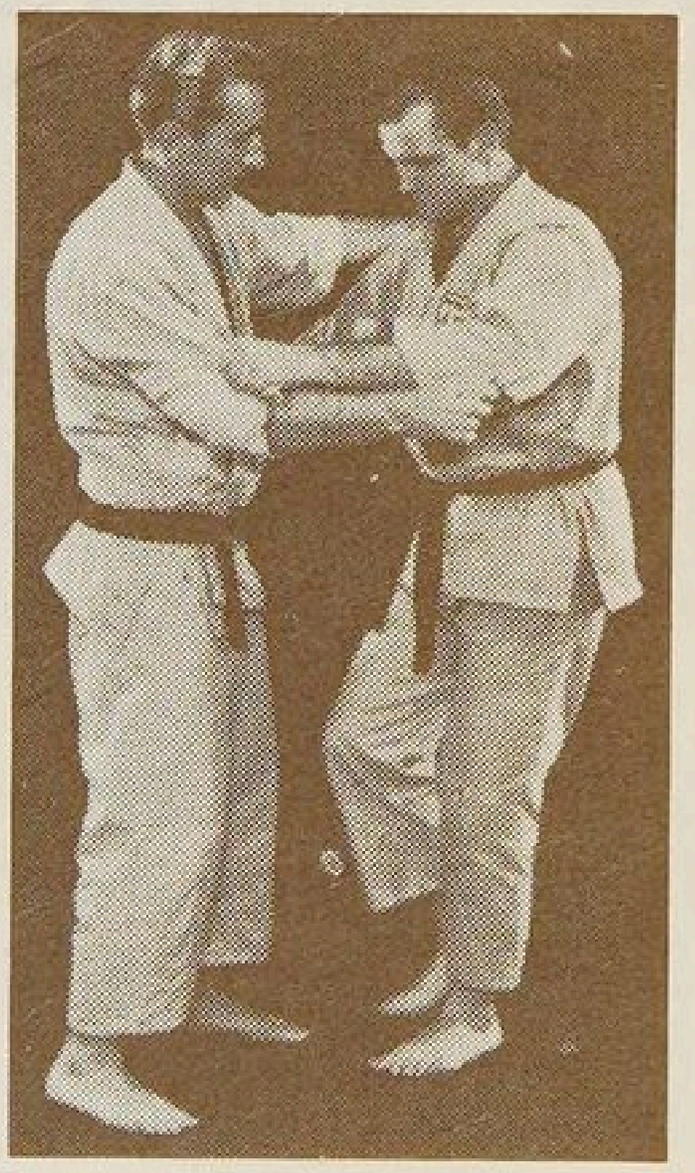
290



291



292



293

294

295

296. Ease your partner's fall by tugging at his right sleeve. Before stepping back into strong balance, simulate an ending blow of your choice.

Sweeping Foot Throw

297. The first action in this throw for self-defense is intended to make him shift his weight back so that he is vulnerable to this particular technique. A yell and a hand thrust toward his face should make him react by shifting back.

298. Capture the lead arm and continue pushing him back off-balance as you draw your leg up to prepare for the sweep.

299, 300. Maintaining your slight backward push at his upper body, sweep his forward foot up using the bottom of your foot against his ankle; when his balance is entirely broken, with a sharp, jerky action, pull him around and back (in the direction of no-support) as you continue to raise the swept leg.

301. When the throw is completed, simulate a punch into the face, then step back into strong T-position.

Hip and Straight Foot Takedown

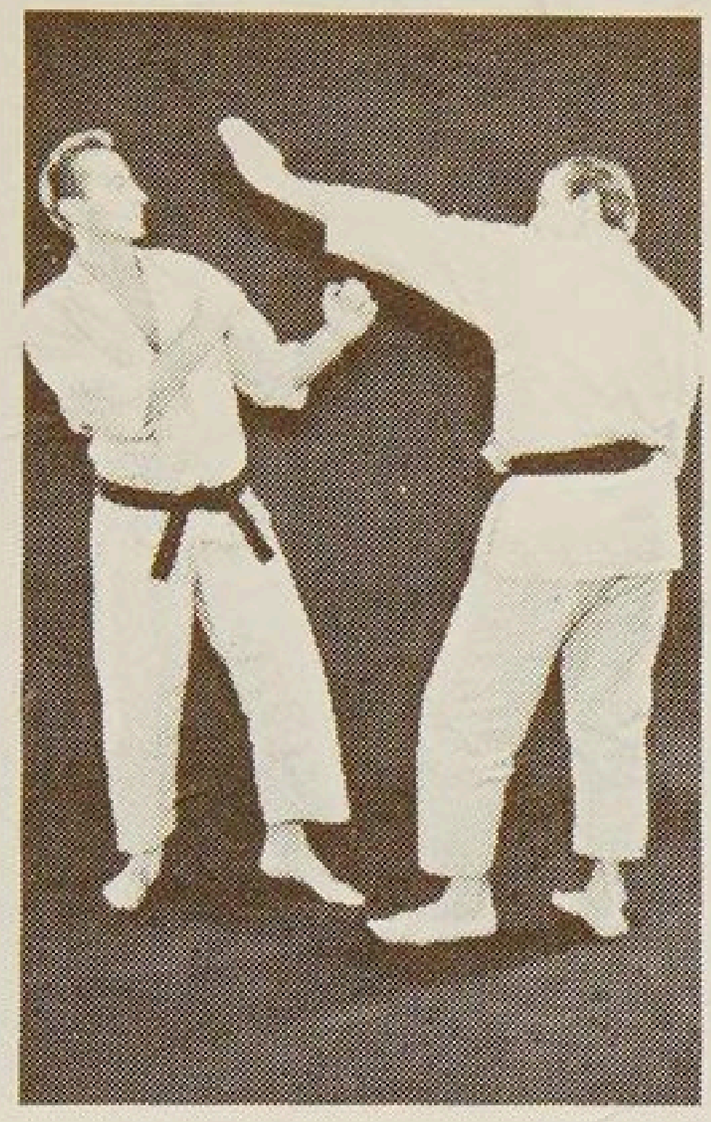
302. After pre-throwing action, turn your left foot so that it points away from your partner; grab cloth at his right sleeve with your left hand.

303. Turning counter-clockwise, step in with your right foot and place your right leg and hip firmly against his right side; simultaneous with the leg action, put your right arm around his waist, lean your upper body left and pull him around and into your chest with your left hand.

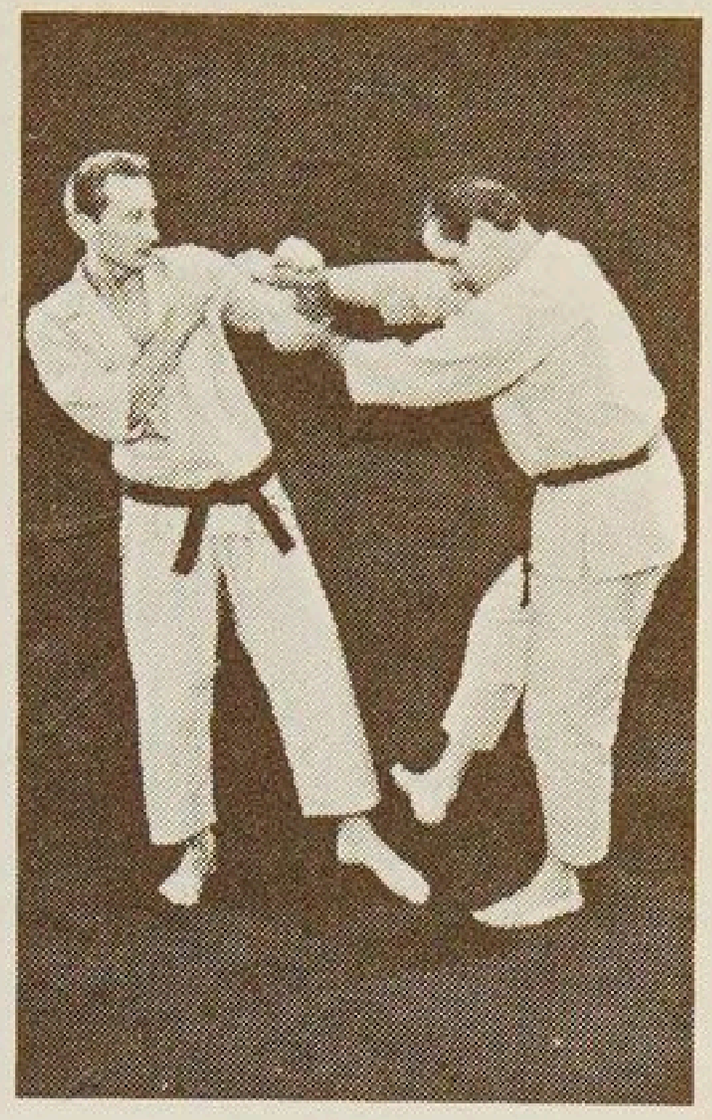
304. Throw is executed by a sharp twist of your arms to lever him over your hip.

296

297



298

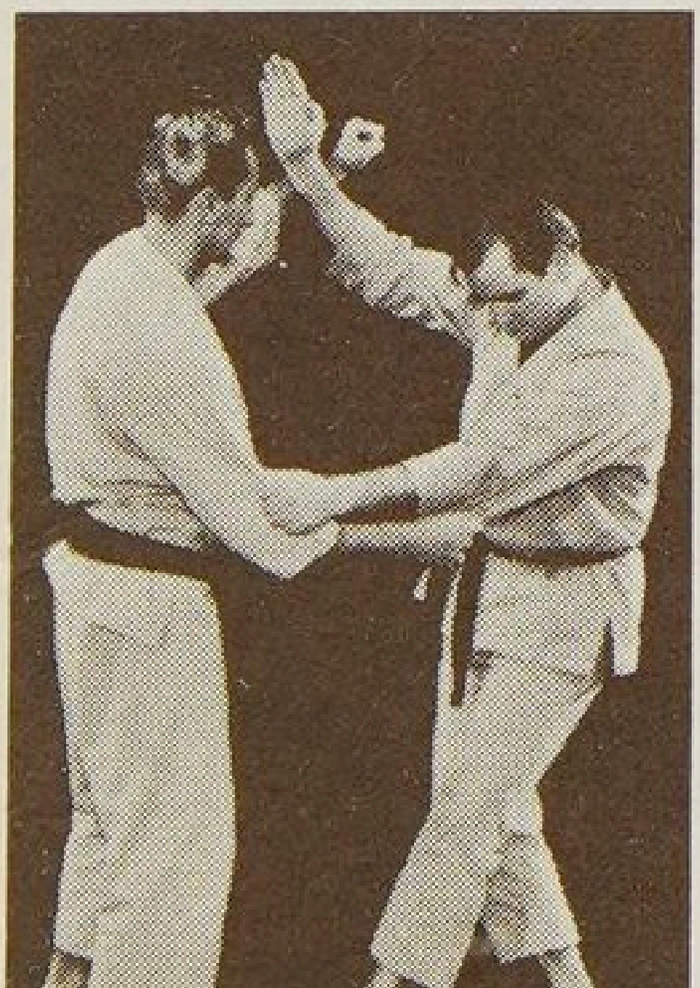


299

300

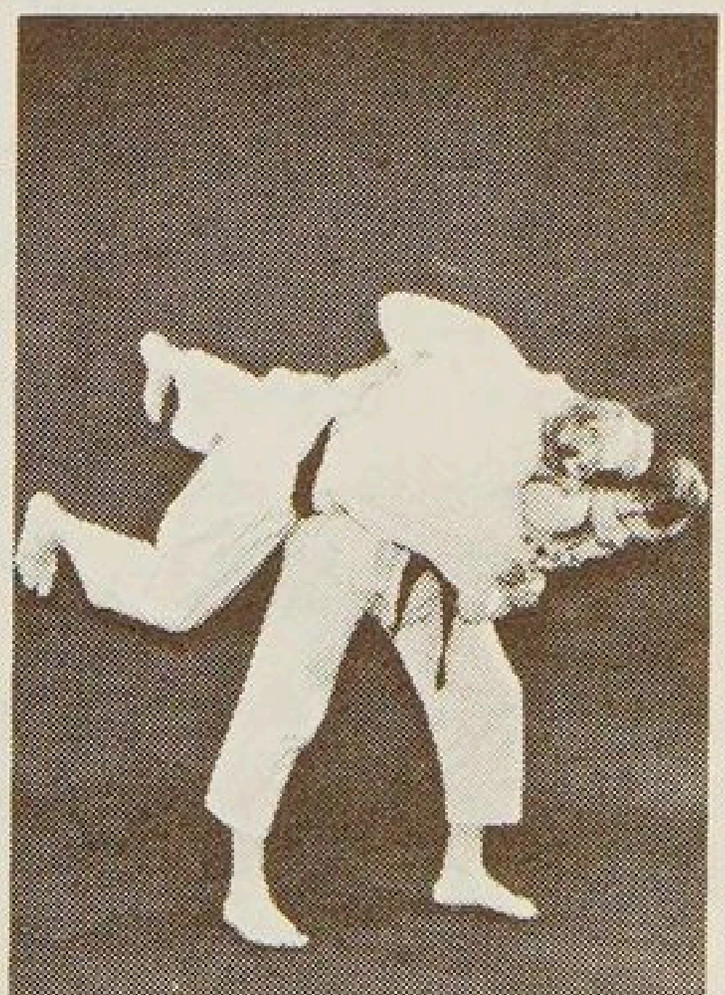
301

302



303

304



305. When the throw is completed, step back into strong balance and simulate a retaliatory blow.

DEFENSES AGAINST ATTACKS

Front Choke Defense

306. Left partner simulates choking from the front.

307, 308. Clasp your hands (do not intertwine your fingers) and thrust upward with quick, snappy action between his arms, carrying through to effect release . . .

309. . . . and immediately hit downward on his nose.

Fist Attack — Close In: Three Blow Defense

The great advantage of using the triple simultaneous blow defense is this: It is very, very difficult for anyone, even an experienced street fighter, to block three simultaneous blows. The average person could almost automatically block one blow; an experienced opponent can often block two blows; but hardly anyone can successfully block three different blows at the same time. Although single blows can be delivered with greater power, I always assume that you are defending against a heavier, larger adversary and that power is not your best defense. If you can learn simultaneous blows and learn where to direct these blows for greatest efficiency, you have a much better chance of defending yourself well.

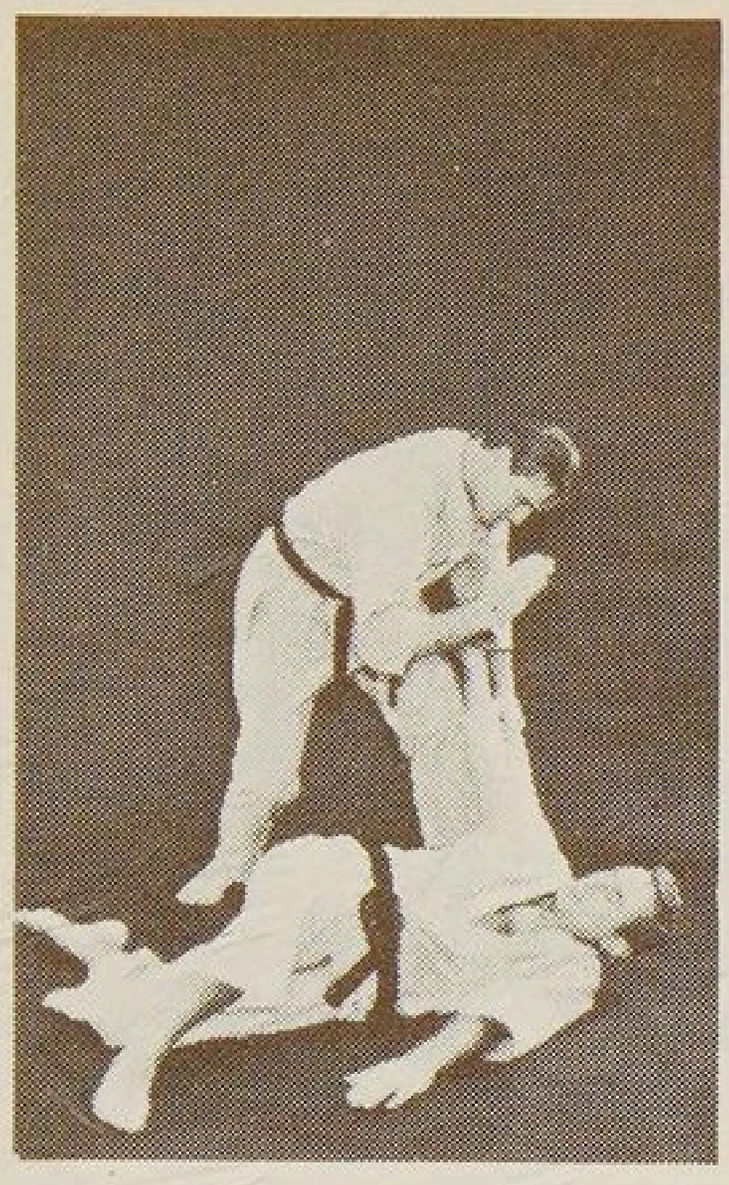
310. As right partner simulates punching attack, close-in, left partner slashes both arms outward and then without hesitation . . .

311. . . . delivers three simultaneous blows. One hand blow should be directed into the upper body or face, the other hand blow should be into the mid-body and the kick should be low. This triple action is quickly followed by a second series of three blows. Since kicking action is commonly followed by a recoil, set the first kicking foot down and deliver the second kick with the other foot.

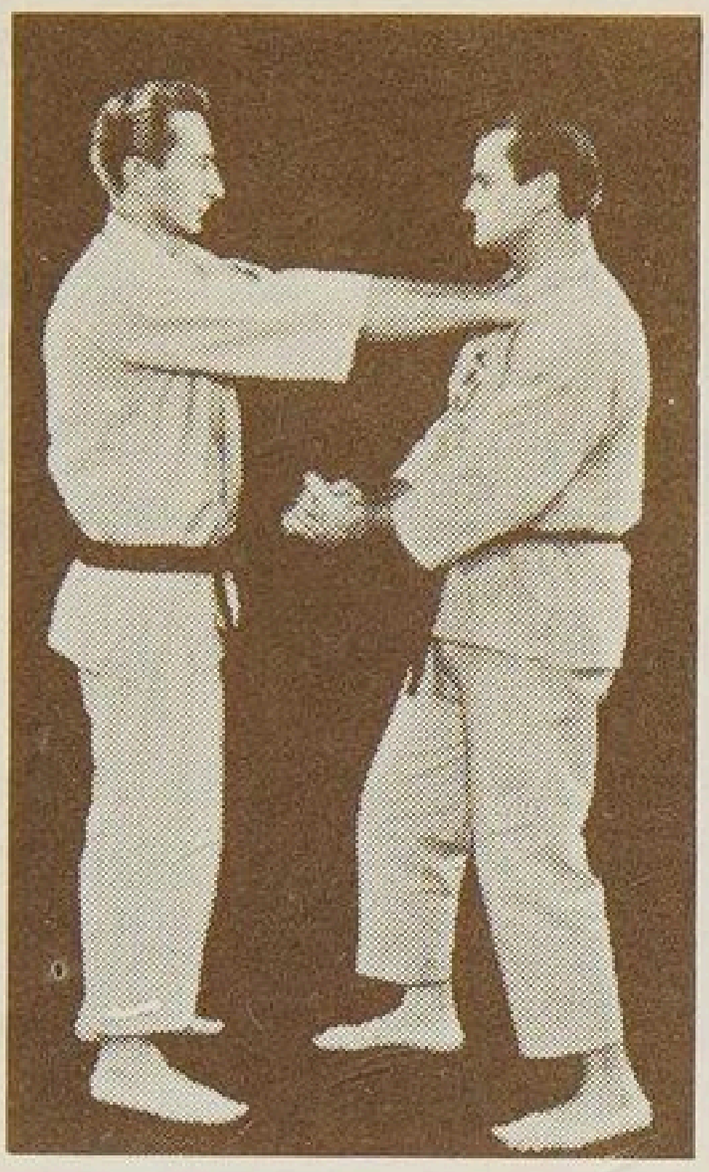
312, 313. After the two series of triple blows weaken your adversary, spin him around, and continue to deliver hand and foot blows as required.

In the test, you will not be required to finish with a takedown; on the street you might have to use a takedown.

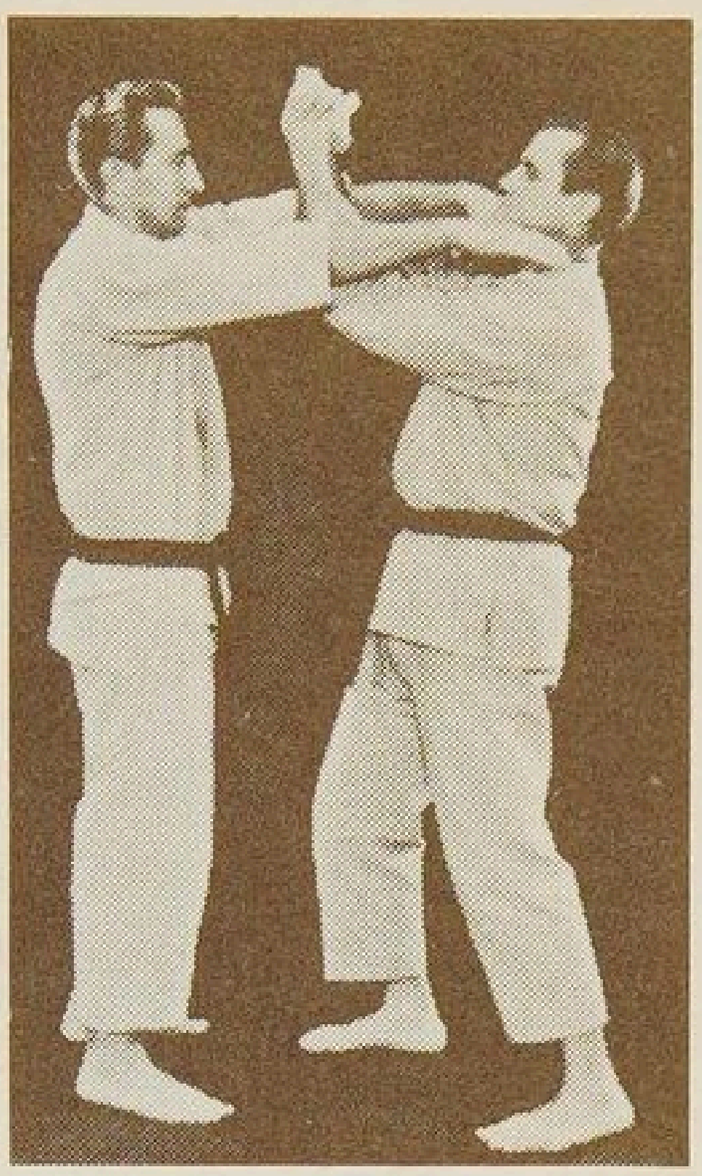
305



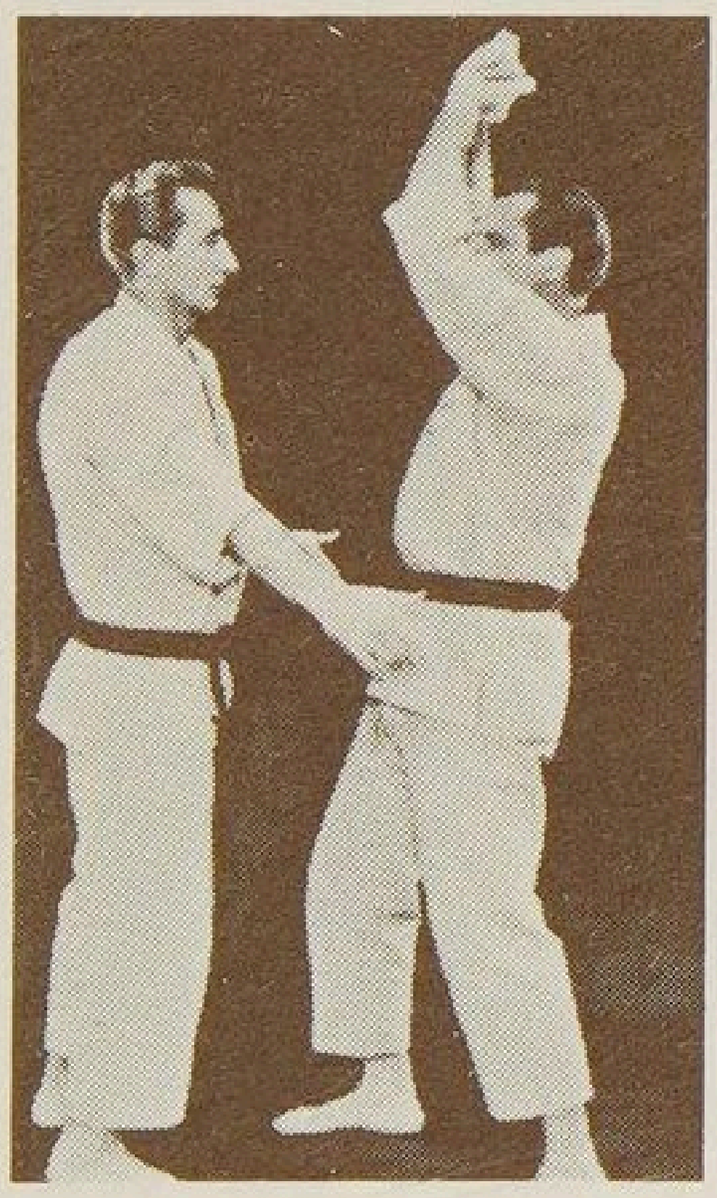
306



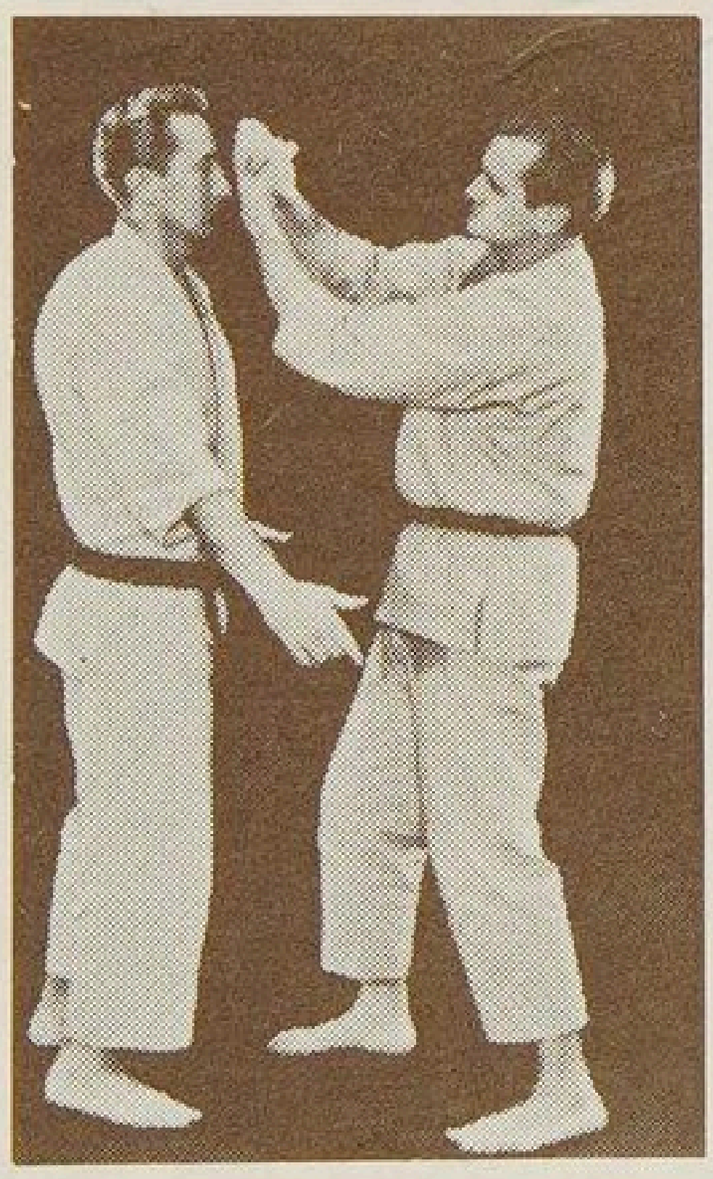
307



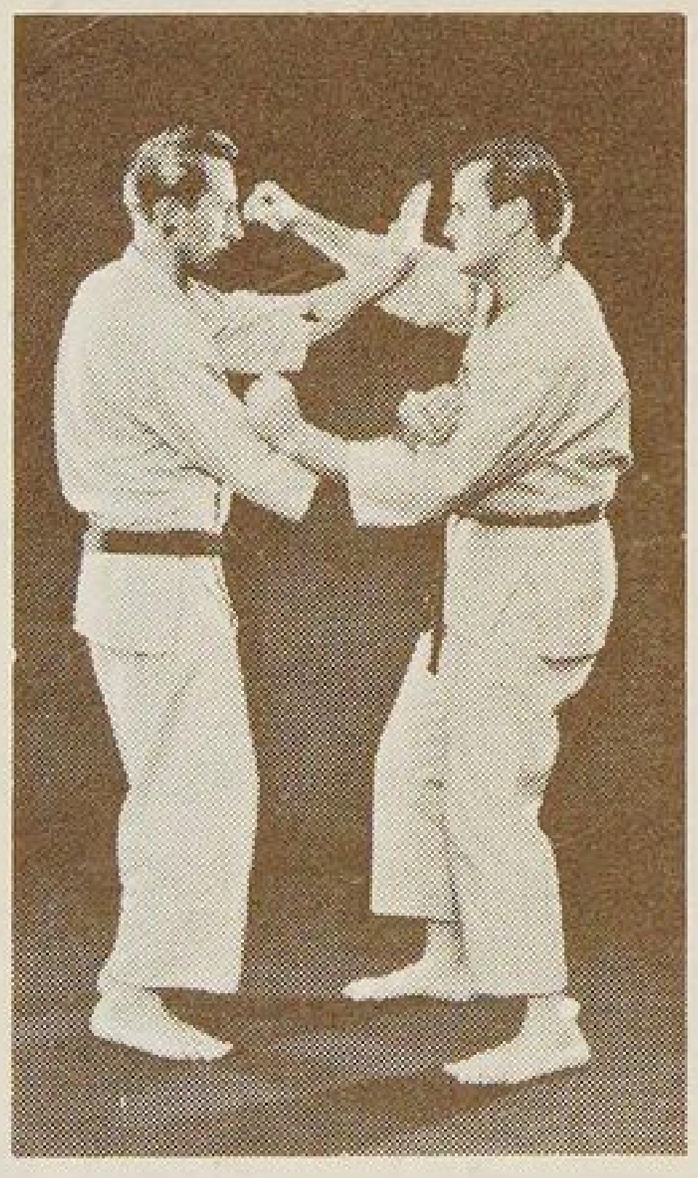
308



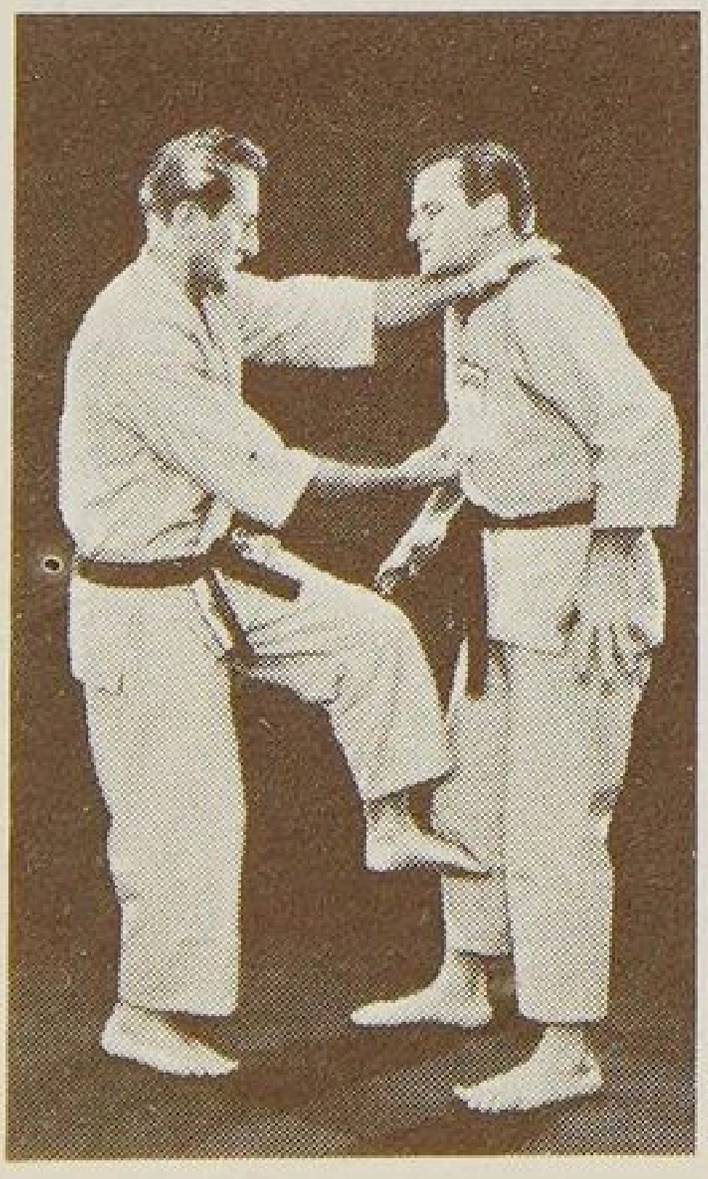
309



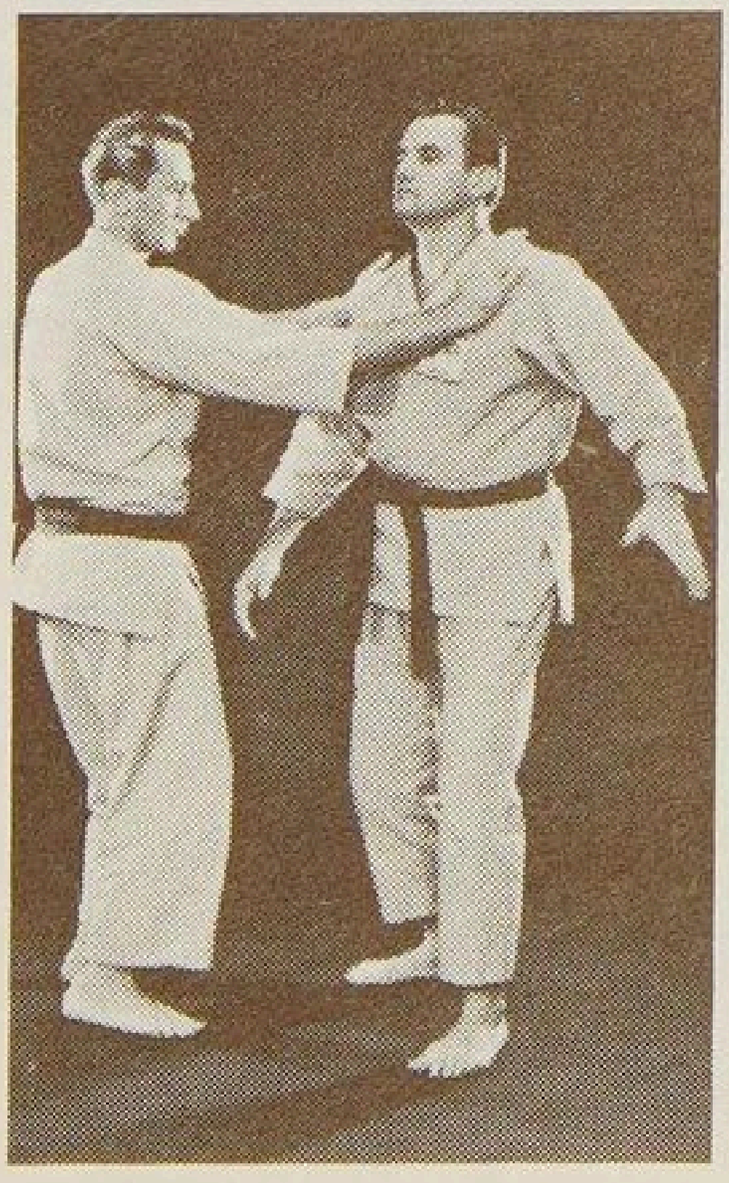
310



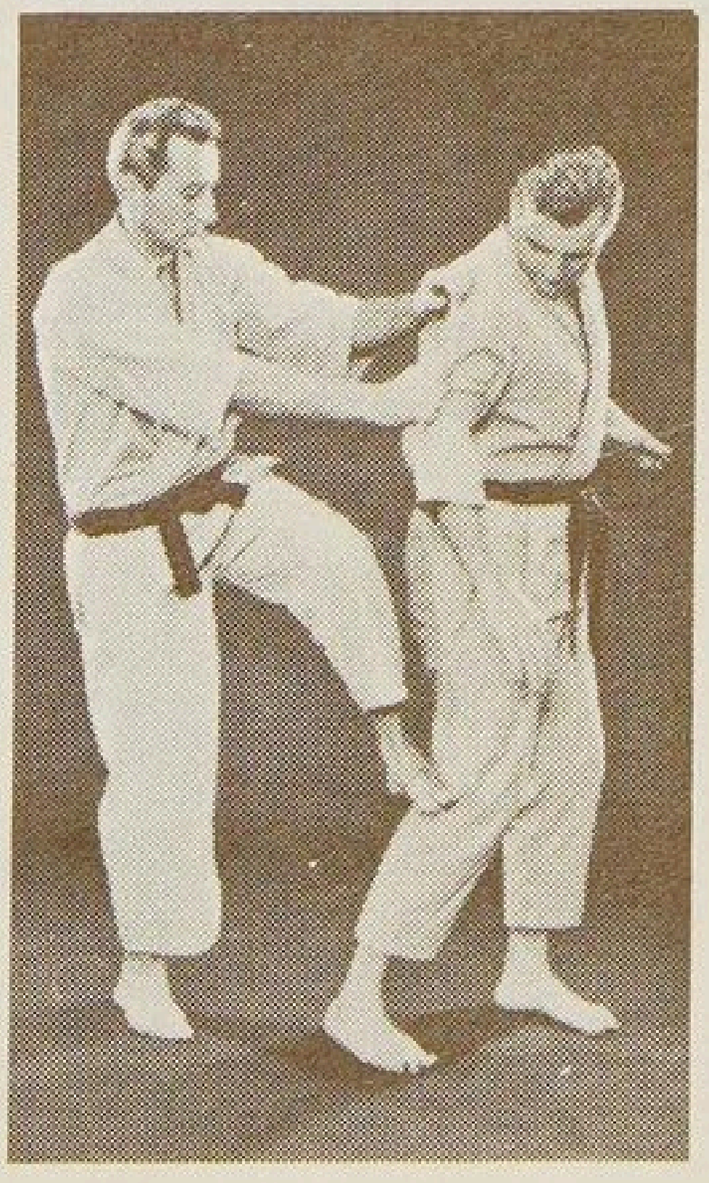
311



312



313



Fist Attack — Out of Range: Parry Defense

314. The attack simulated by left partner is made at arms' length. It is this distance factor which allows you to use the parry defense. Although leaping is preferred to the parry defense, in this case it is assumed that there is no space in which to leap out of danger.

315. As he attacks, parry-slash the hitting arm to deflect its direction as you sidestep and shift your body to the side to put your head out of hitting range. It is also possible to parry-hit using both forearms, rather than the slashing defense shown.

316. Follow parry with hand and foot blows, working your way around to the rear of your opponent.

317. Finish with back takedown, as shown.

Back Body Grab — Over Arms

318. Left partner applies body grab over the arms.

319. Slash back into the thigh as you kick with vigor into the shin or knee.

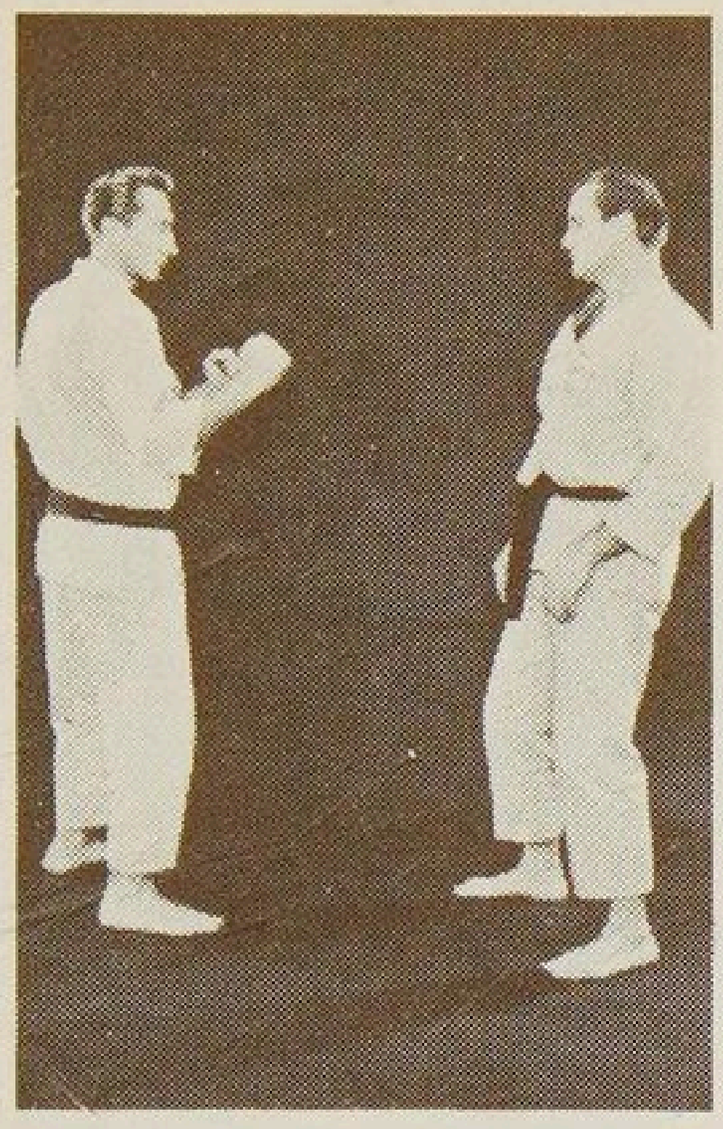
320, 321. When the adversary has been obviously weakened with additional kicks and slashes, clasp your hands, take a deep breath and force your arms outward against his elbows; then quickly exhale as you make a half turn and deliver an elbow blow into the mid-body.

After release is effected, step back, out of reach of the opponent. For the test, assume a fighting stance; on the street you would continue with kicks as required.

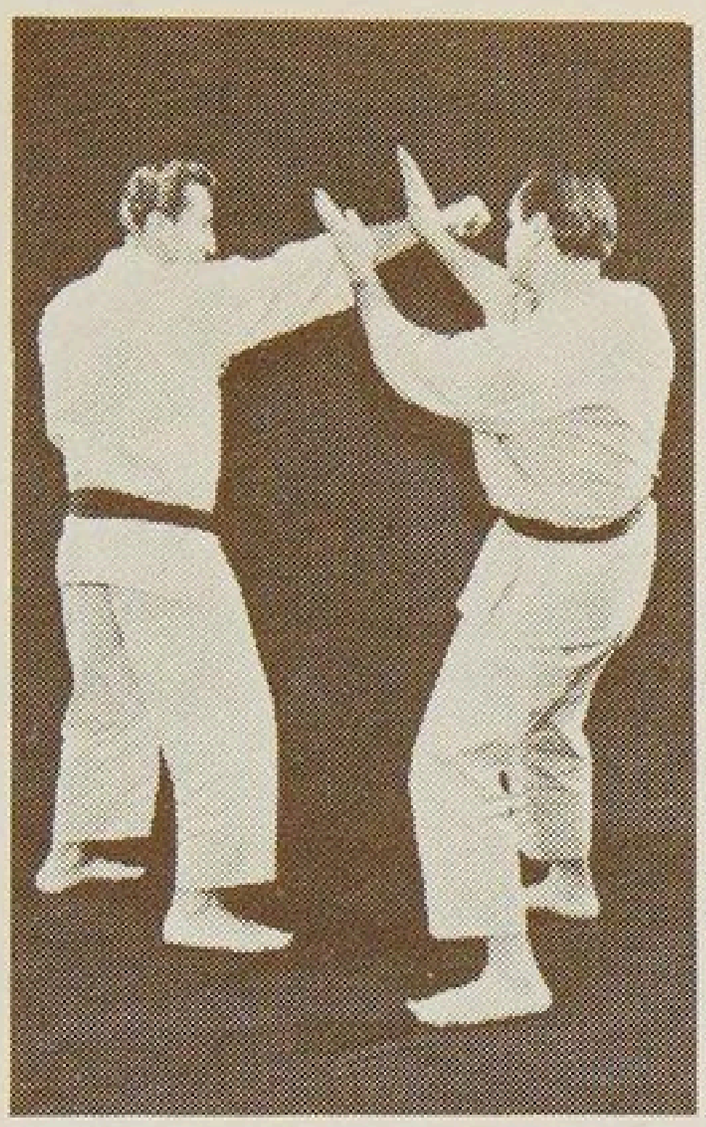
Rear Choke with Forearm

322. Left partner simulates choking from the rear, using forearm.

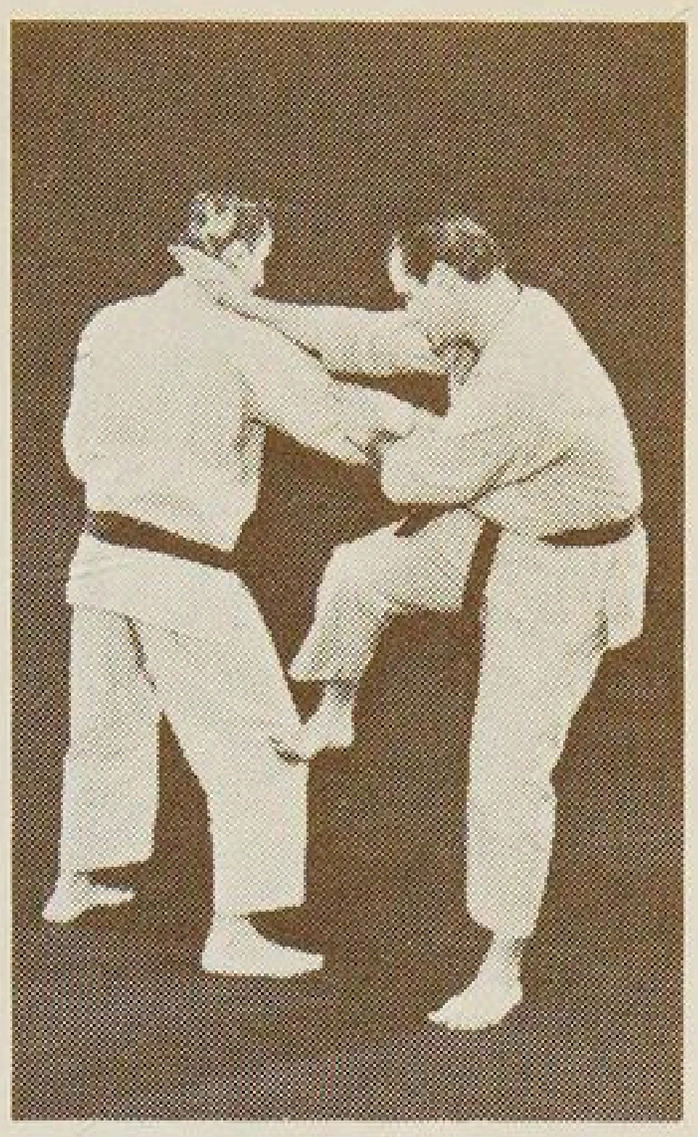
314



315

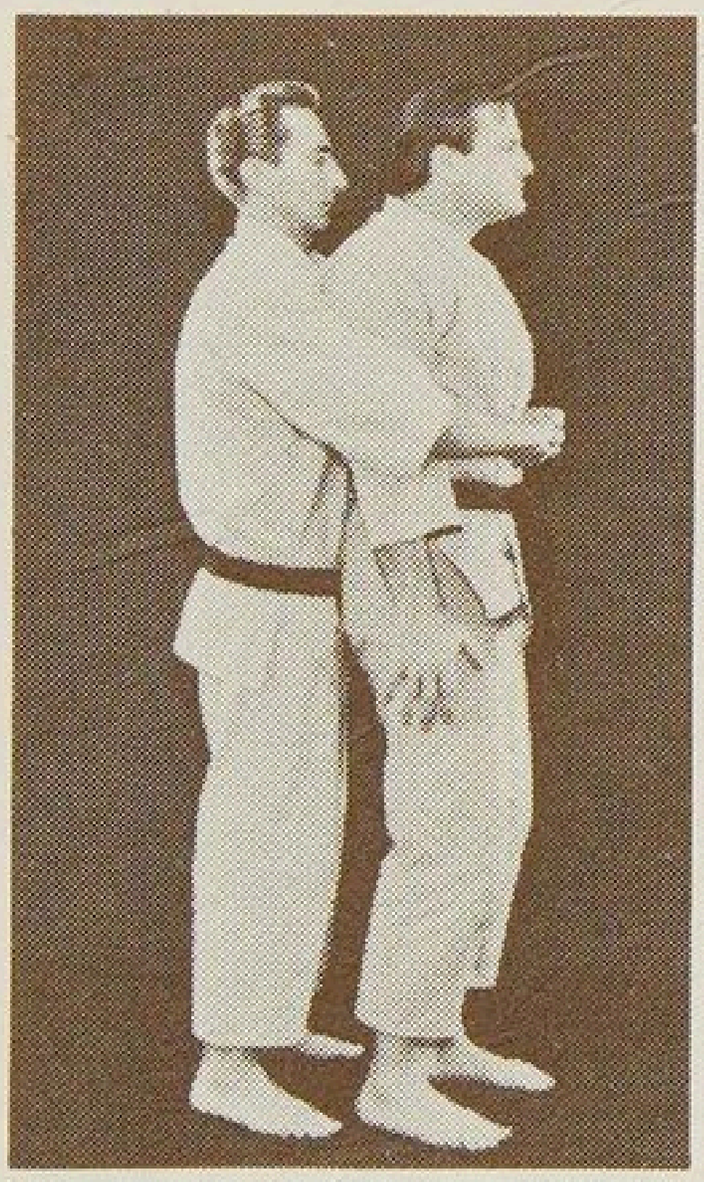


316

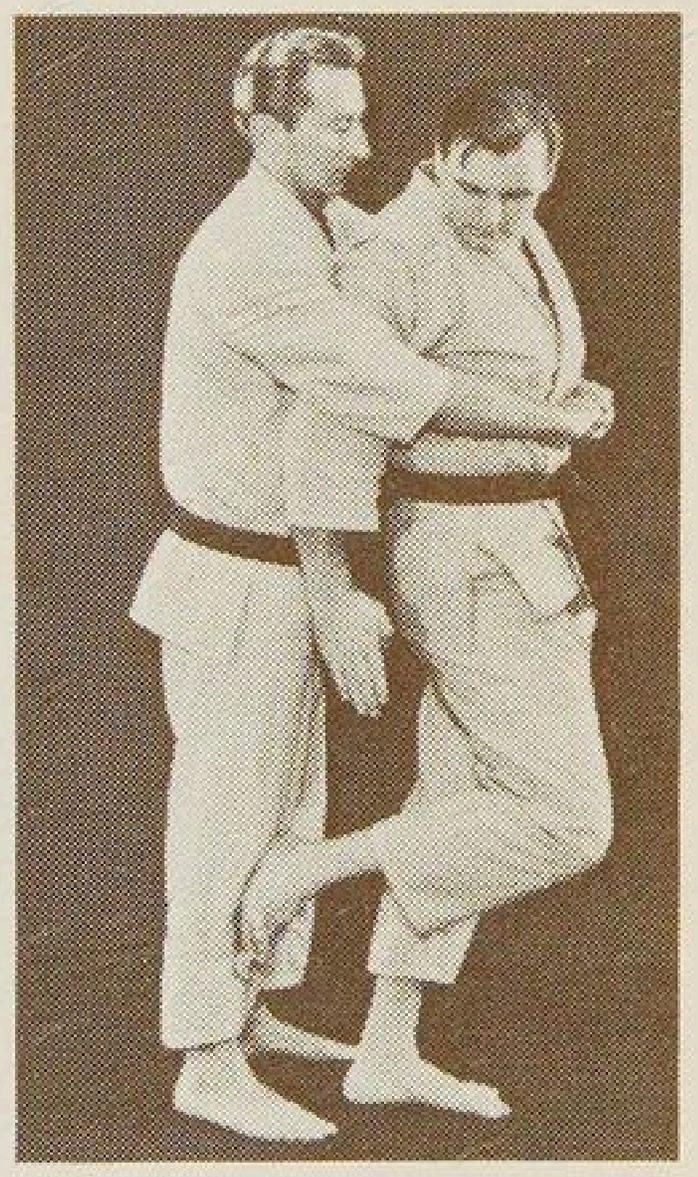


317

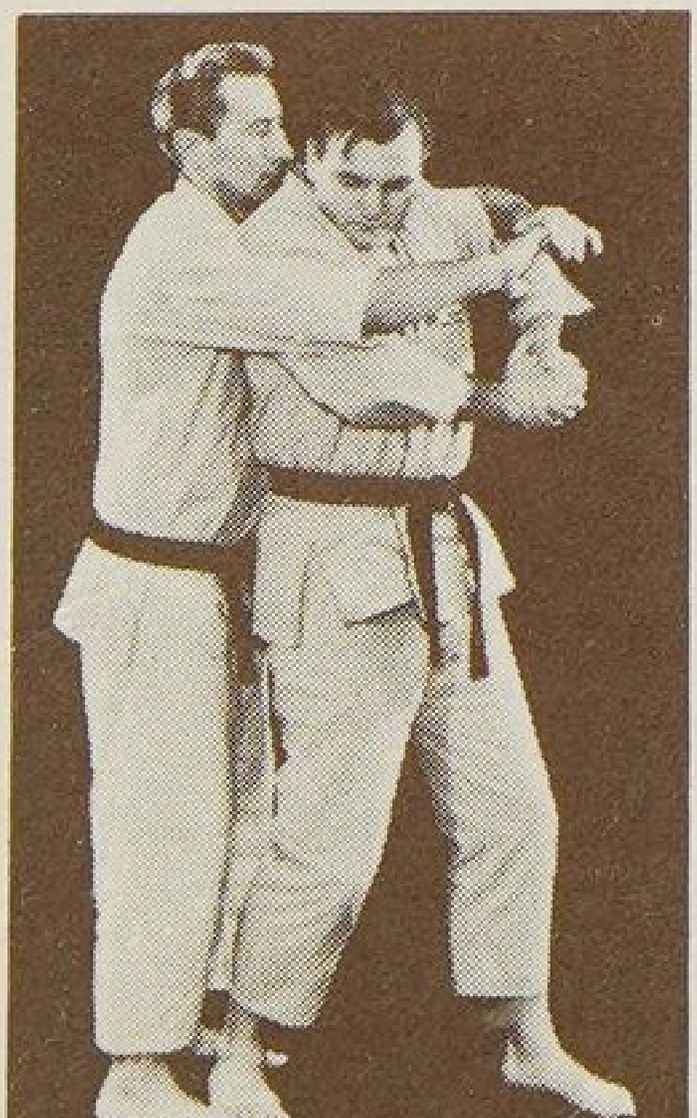
318



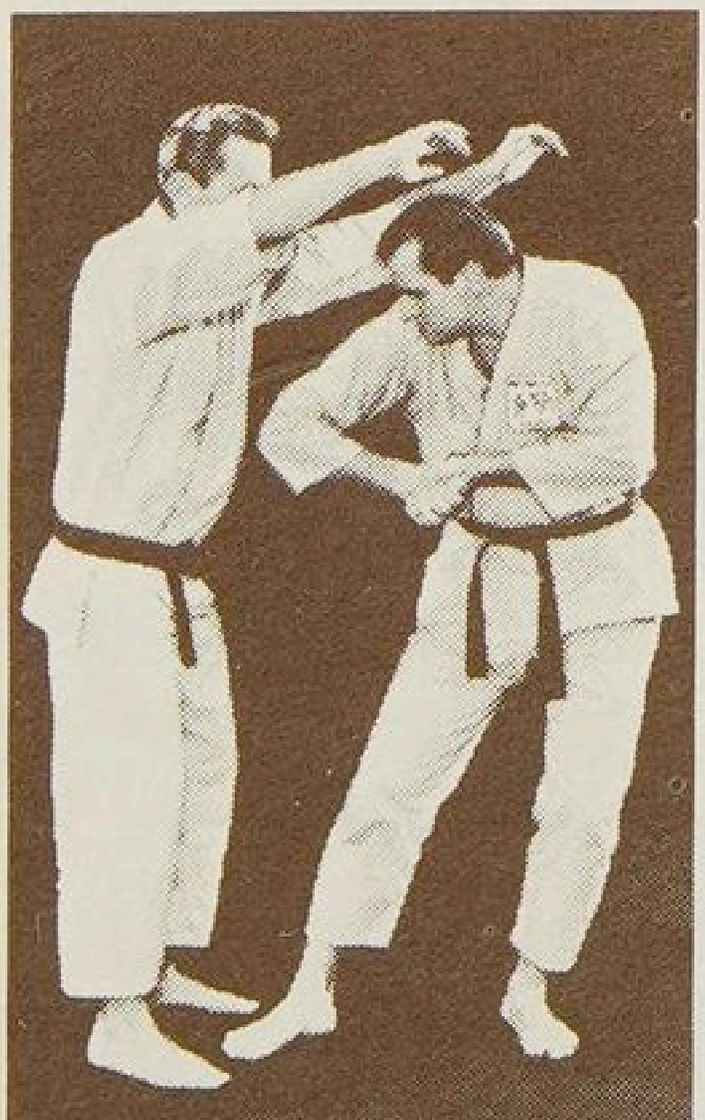
319



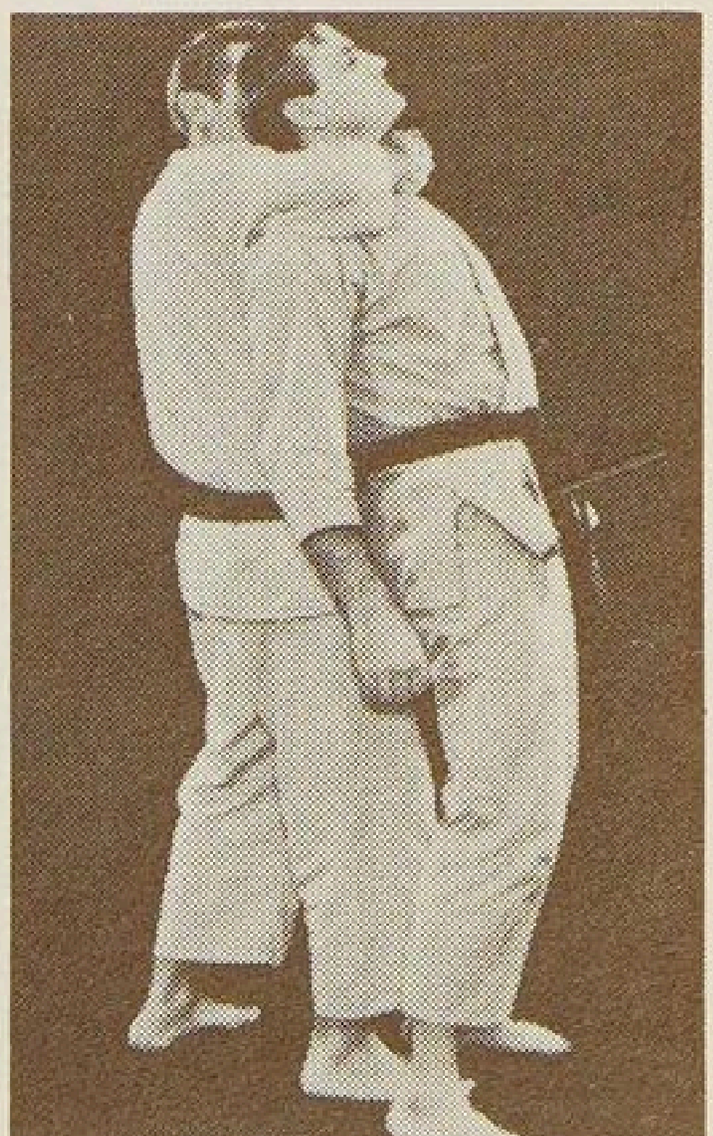
320



321



322



323. Turn your head into the bend of his elbow to relieve choking pressure; grip his choking arm at the elbow and wrist and jerk down sharply as you kick into his shin. Continue with several additional kicks and scrape down onto the shin and stamp onto the instep to further weaken your adversary.

324, 325. When he is obviously weakened, jerk down again sharply on his arm to effect release as you step out to the side and then to the rear of your opponent. As you back out from under his arm, pull your head free. Maintain your hold on his wrist.

326. Pulling his held arm sharply back and up, continue to deliver hand and foot blows as needed.

For the test, simulate one retaliatory blow after immobilizing his arm.

Club Attack — Back-Handed

327. Right partner simulates back-handed club (or medium stick) attack.

328. As the striking hand moves forward, step deeply in as you block his arm with both your forearms.

329. Immediately grip his wrist with your right hand as you strike a left forearm blow at his elbow.

330. Apply the basic arm bar and lower him to the ground.

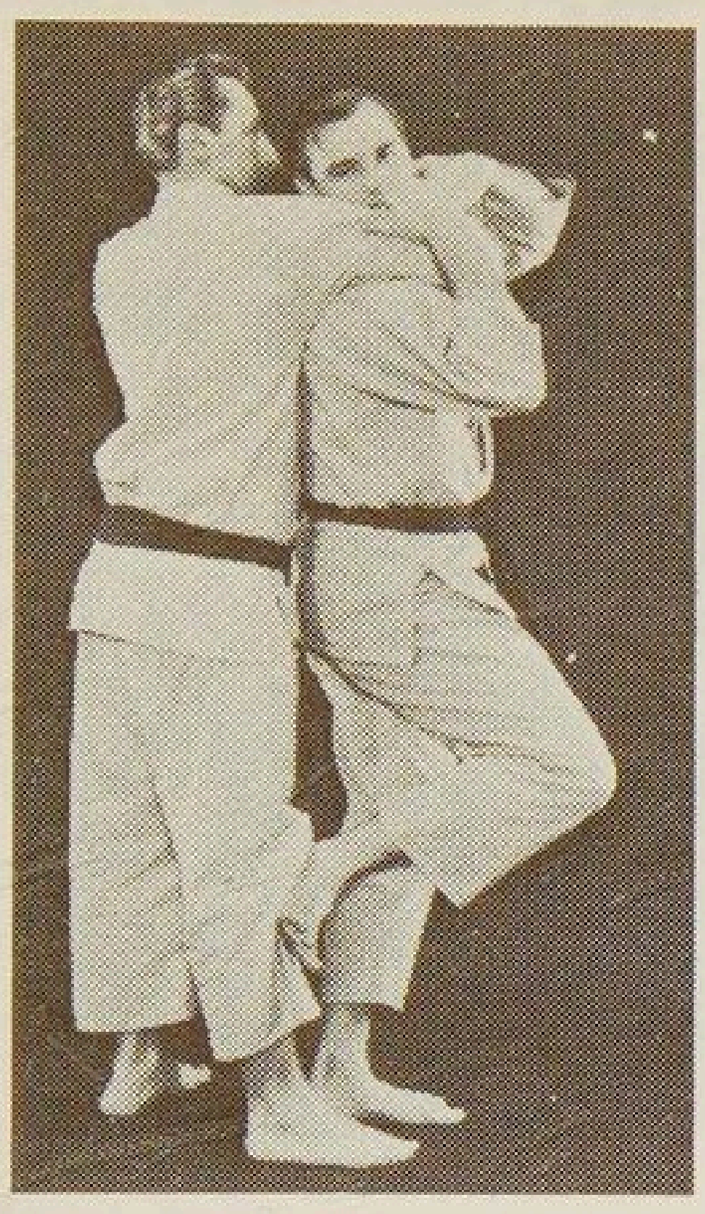
Of course, for the test, you follow all safety rules, simulating the forearm blow and pressing against his arm for the takedown; in actual self-defense, the forearm blow would be a forceful one and you would put body weight behind the takedown to make it effective.

Knife Attack — Slashing Style

Reread the section "An Armed Assailant: When to Defend."

331. Left partner simulates slashing style knife attack.

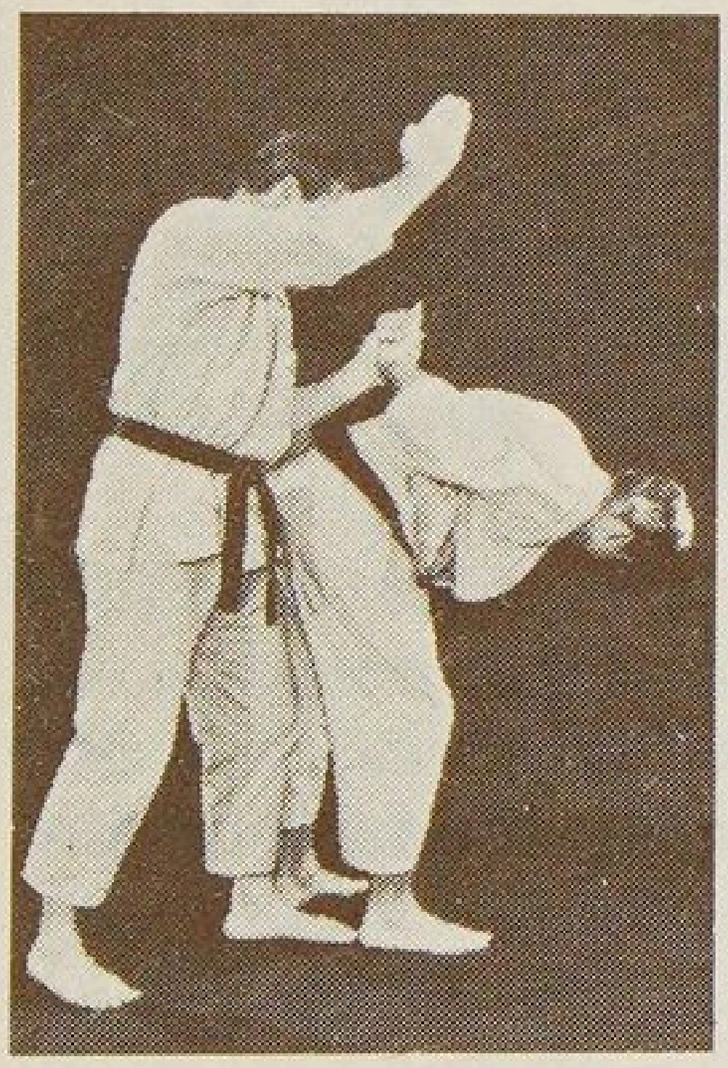
323



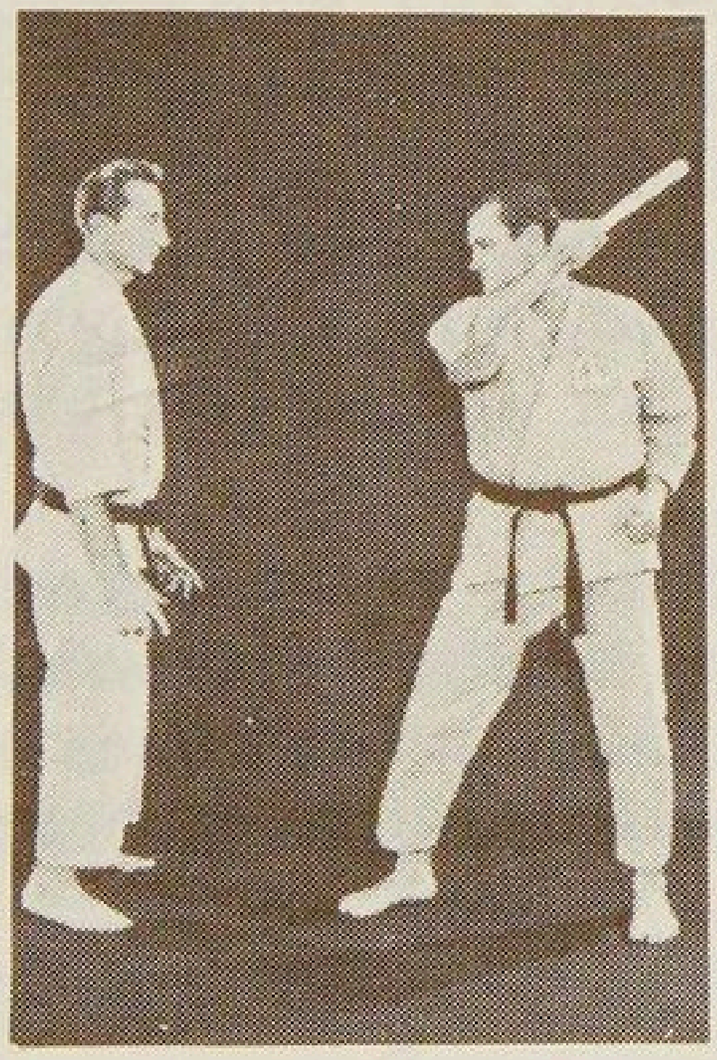
324

325

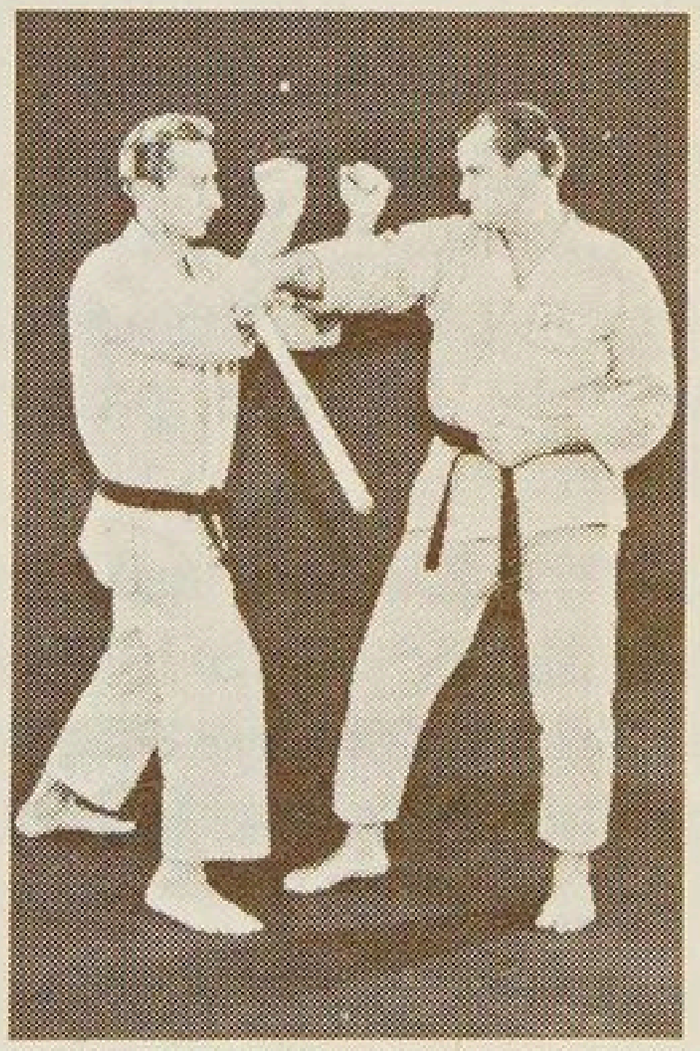
326



327

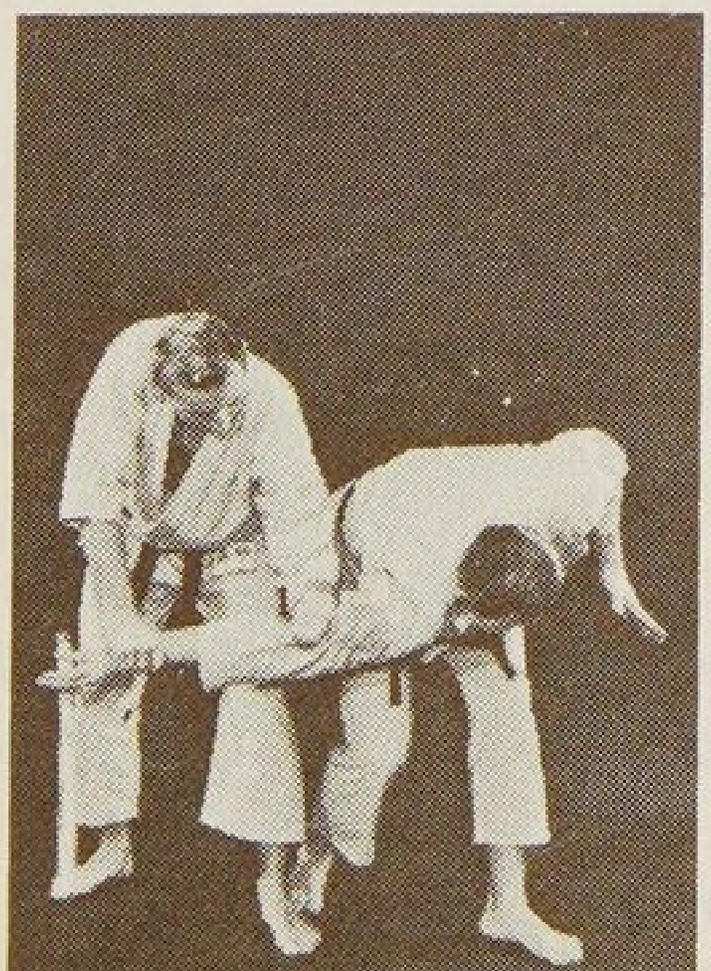


328

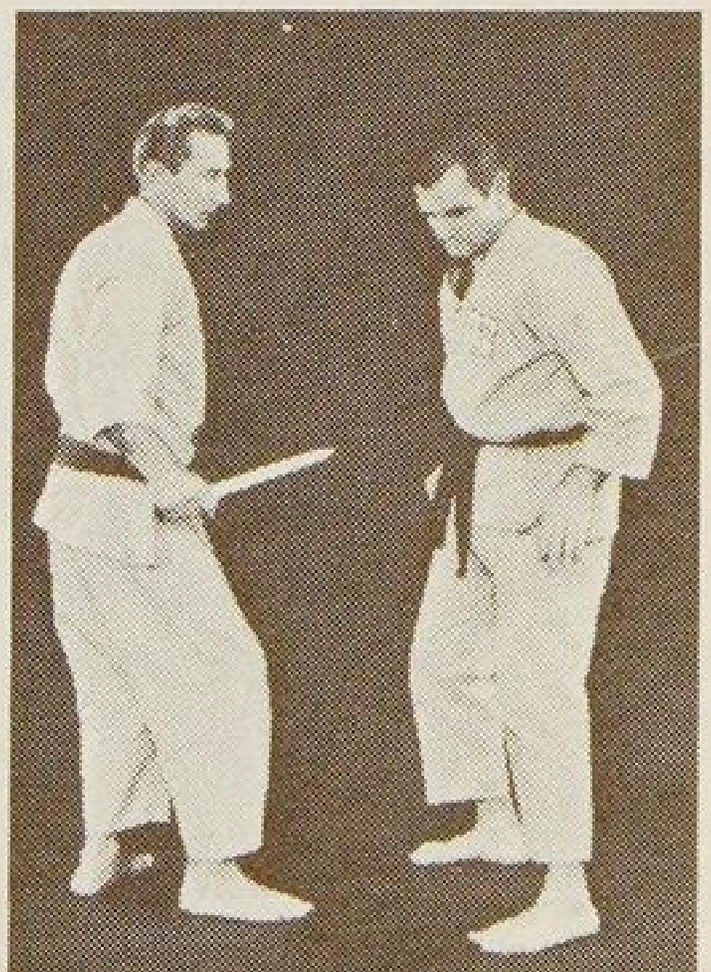


329

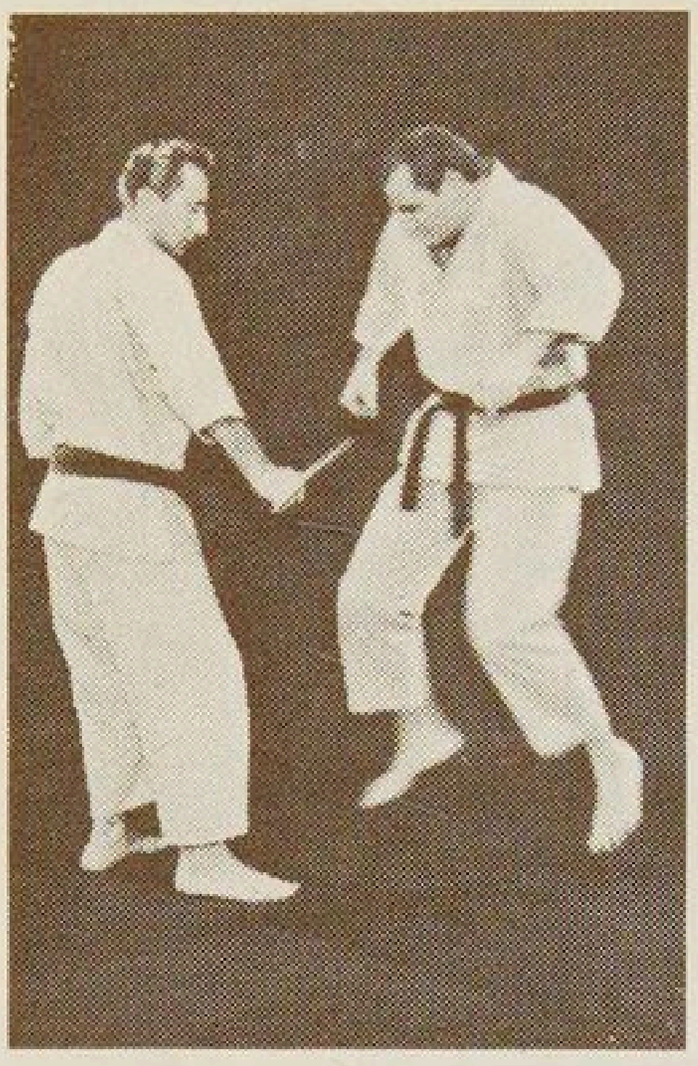
330



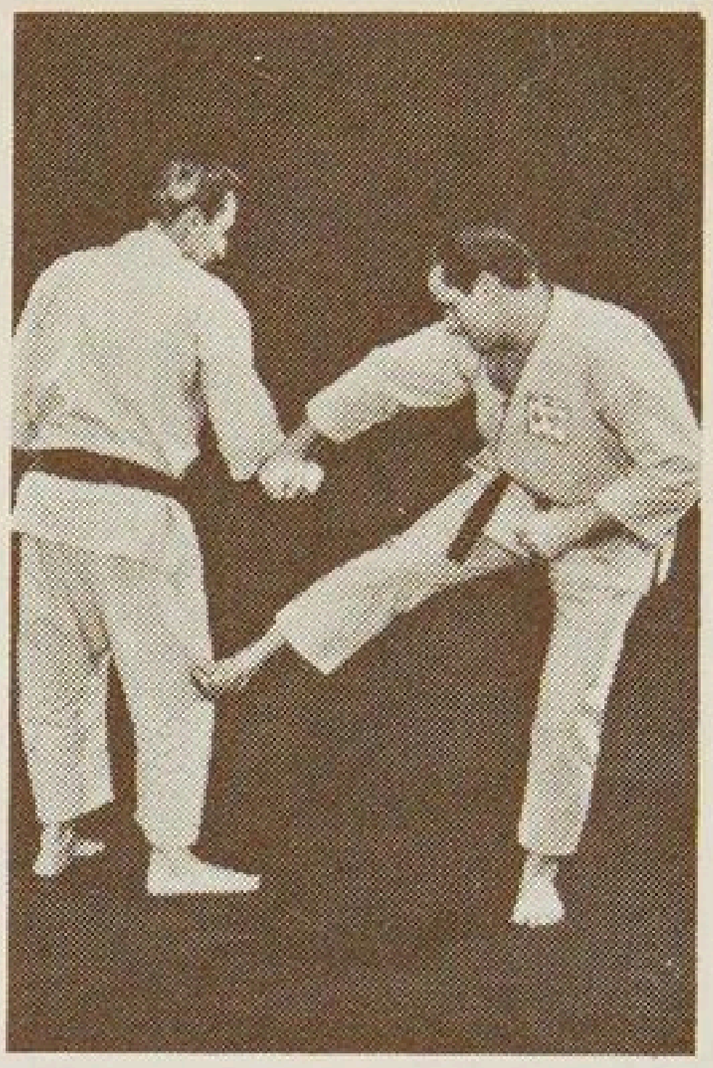
331



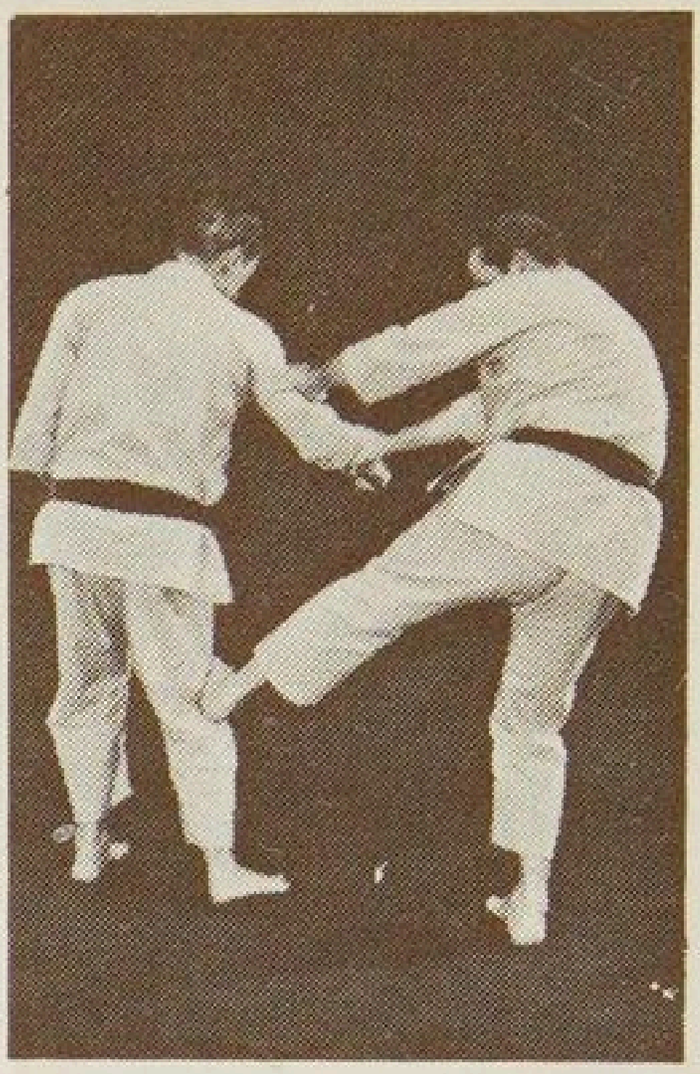
332



333



334



332. Leap to the outside of his knife hand . . .

333. . . . and immediately kick with force into his knee. If your movements are very quick, you will not need to apply the other simultaneous action, which is to deliver a back-handed parry to his knife arm; but if you are not so fast in moving your body out of range, the back-handed parry is a helping action. Do not deliberately try the parry, nor should you block or grab the knife itself.

334. Deliver several kicks in succession. When he is visibly weakened, grip his arm at elbow and wrist and continue to kick until he lets go of the knife or until he is on the ground. Do not try to take the knife away until he is completely subdued or disabled.

For the test, partner who attacks will use a stick for safety. Demonstrate this technique by simulating two kicks and immobilizing the knife hand.

FREE-STYLE SPARRING

This is the method of training which is more advanced than either rehearsed or give and take practice. In free-style work, neither partner is permitted to know beforehand what type of attacks will be made and defenses are improvised in response to the attacks. Moreover, practice partners do not permit attacks or defenses to be made without opposition. As you attack, your partner in free-style tries to prevent the attack and tries to counter-attack. As you defend against his attack, he tries to avoid your defenses.

Free-style is excellent practice procedure for developing quick and appropriate response. It is required of men in order to achieve belt ranks and it is marvelous exercise.

It is traditional in the old-fashioned style of training (for judo and karate) to insist on free-style practice for all students. I do not agree with this procedure for the following reasons: The people who need self-defense training the most, are least likely to enjoy, be willing to, or be very efficient at advanced free-style practice. Women will not engage in free-style practice. Self-defense training, if it is to be available when you need it ten years from now, must not and cannot depend on your having remained in top training condition during all that time. Most students, even very good and enthusiastic students, stay in training for a period ranging from a few months to a few years. Only the most exceptional students continue a program of many years of training. So, to be realistic and practical, we must not depend on free-style sparring as the means of insuring efficient self-defense.

Women students are not required to engage in free-style practice for higher degrees unless they want to; instead they are asked to demonstrate give and take sparring on a more technically proficient level for advanced degrees.

Men who are primarily interested in the practical applications of self-defense should be reminded again that very efficient self-defense training can be accomplished without free-style sparring, though belt ranks do require it.

335, 336, 337. These photos are a sample of attack, defense, and counter-attack. Students are graded on the ability to plan effective attack; on the basis of quick and appropriate response to attack; on the basis of good counter-attack. The ability to use combinations of blows and kicks will greatly enhance free-style work, making attacks more efficient and making defenses more difficult for your opponent.

335

336

337

For the test, a maximum of two minutes of sparring should be adequate for demonstration of the student's ability. In order to train for the test, students should spar for longer than two minutes to develop endurance.

Target points for sparring are any of the nerve centers and pressure points you have learned up to now — with the exception of eyes, windpipe, groin, or kidneys. An accidental contact blow made into any of these four areas can result in very serious, permanent injury or even fatality.

Points are deducted for making contact, except in blocking. Your control should now be sufficiently developed to allow strong, good point blows to be delivered two inches from intended target.

HOW TO TAKE THE TEST: BROWN RANK (One Stripe)

This test must be given by a person holding the rank of black belt. The general mode of taking the test is the same as for blue rank . For this advancement the student is expected to show proportionate advancement in his ability to perform all the techniques. There is greater precision required, quicker response to situations, and a higher degree of body control throughout.

To demonstrate the kick defenses, both students start from a natural stance. For the test, the proper defense is made for each kick attack and then one retaliatory blow is simulated. Between each type of kick attack, students return to natural stance before demonstrating the next technique.

Holds and locks are performed with regard for safety, with smooth flowing movements but with more speed than than for the previous test. For the test demonstration, each example of the use of holds and locks finishes in a takedown.

Throws are expected to be more crisp; the manner of body movement, going into the throw and recovering balance, should appear more effortless than for blue rank .

After the demonstration, students bow and return to a seated position on the mat to wait for the results of the scoring.

Demonstration of Response to Unrehearsed Attack Situations

How to Take the Test for Brown Rank (Two Stripes)

HOLDS AND LOCKS (for Formal Demonstration)

Control Side Hold

Partners start from standing, facing position; left partner applies the hold; as usual, right partner offers no resistance.

338. As you step forward with your left foot to his right side, grip the back of his right hand with your right hand and simulate a slash into his elbow to bend his arm. Bend his captured hand double; this is the first pressure.

339, 340. As you step clockwise behind yourself with your right foot, slide your left arm under his captured arm, maintaining your right-hand grip. As you complete the step, which places you directly to his side, your left arm locks his captured arm firmly into your hip; your left hand is clasped onto your right hand and both your hands apply pressure at his bent hand.

Choke Hold to Side of Neck

341. Right partner offers no resistance as you step forward with your left foot to his right side and raise his right arm toward your right shoulder.

342. As you take a second step forward with your right foot, slide his right arm across your right shoulder and place your right forearm at the side of his neck. Grip your right wrist with your left hand; apply pressure against the side of his neck, just below the ear, with the bony area of your forearm.

Hand and Arm Hold

Partners start from standing, facing position within arms' reach.

343. Right partner offers no resistance. Grip his right hand with your right hand as though to shake hands, but holding onto the fingers only, not the palm; your left hand grips his wrist in a natural grip.

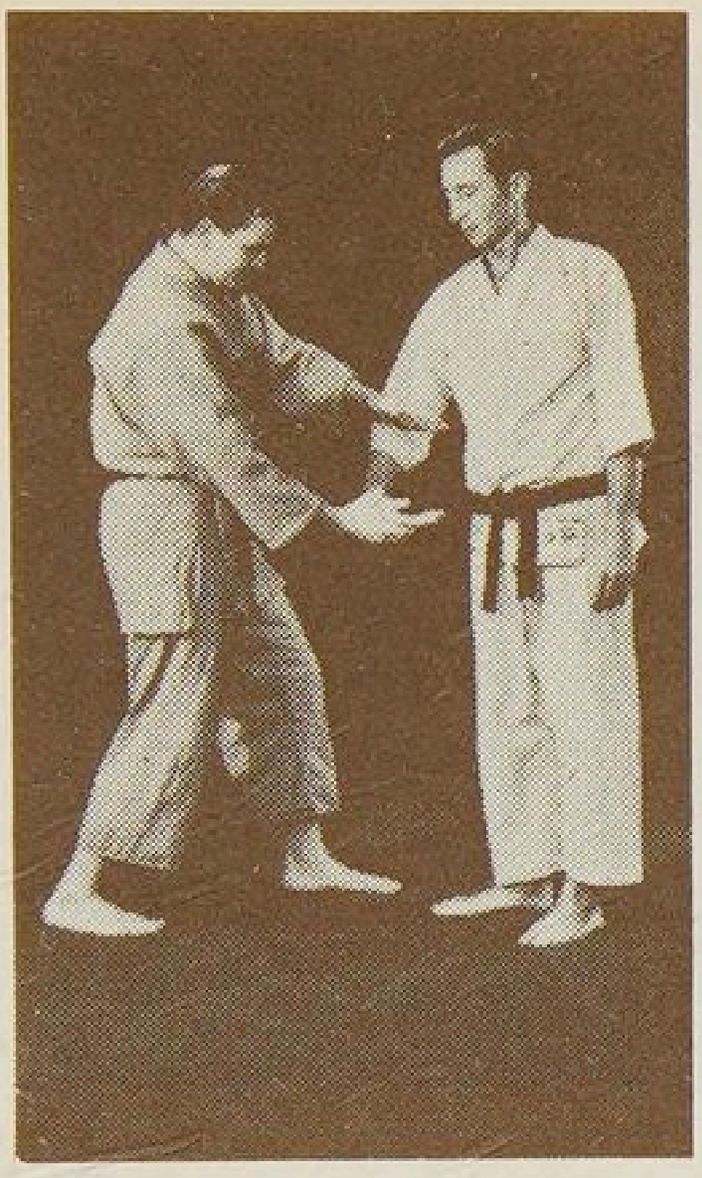
344. As you take a step back with your right foot and assume a T-position (which pulls his arm forward); raise his captured arm so that the back of his elbow crosses your left elbow. Pressure is applied by pushing upward with your left elbow and bending his captured fingers backward. His arm must be turned over so that the back of the elbow is down, otherwise the pressure is ineffective.

Hand and Arm Hold, Cross-Body

345. As you take a step forward with your left foot, grip right partner's right hand (at the fingers) with your right hand.

346. Taking a step back with your right foot into a T-position (pulling his captured arm forward), reach under his captured arm and grip his left lapel high with your left hand, unnatural grip. Pressure is applied by levering his arm down across your elbow (his elbow must be at your elbow) as you bend his fingers backward.

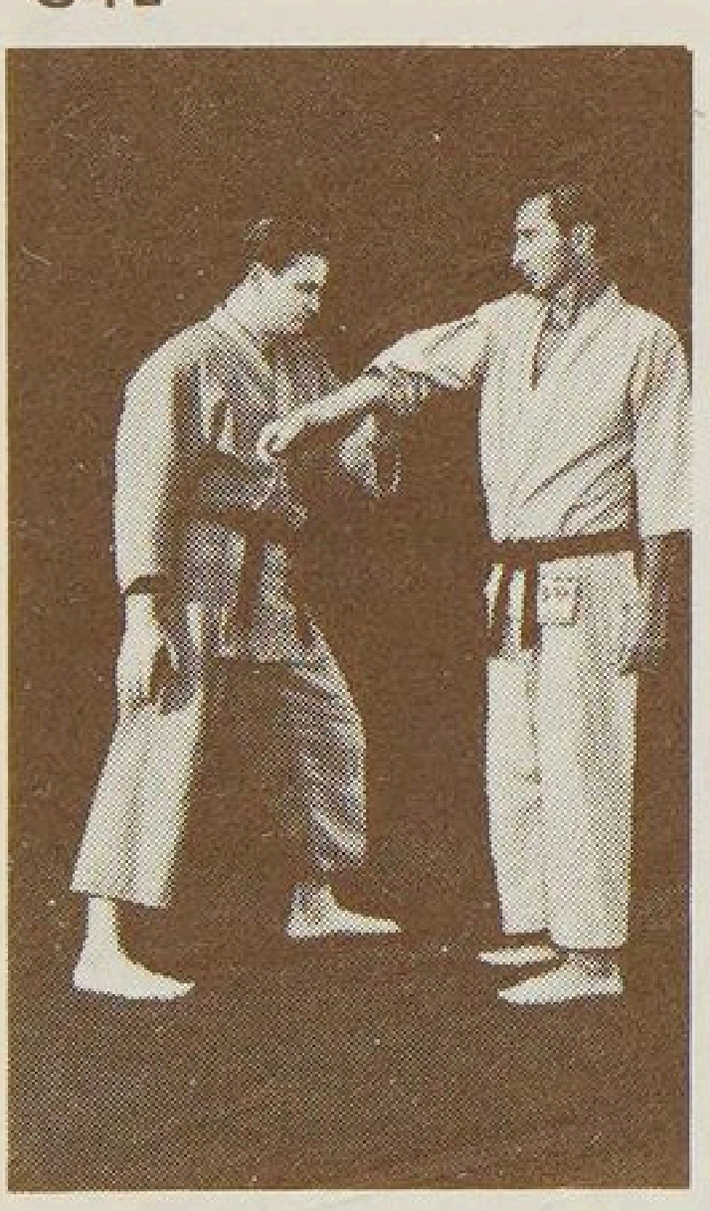
338



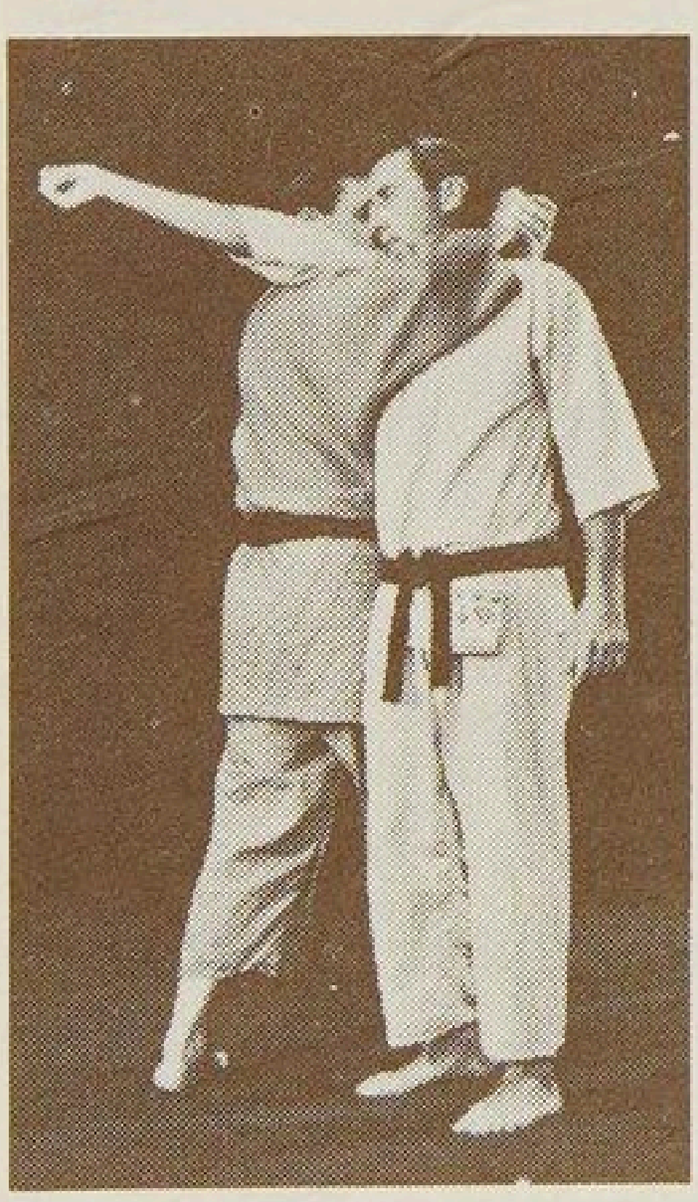
339

340

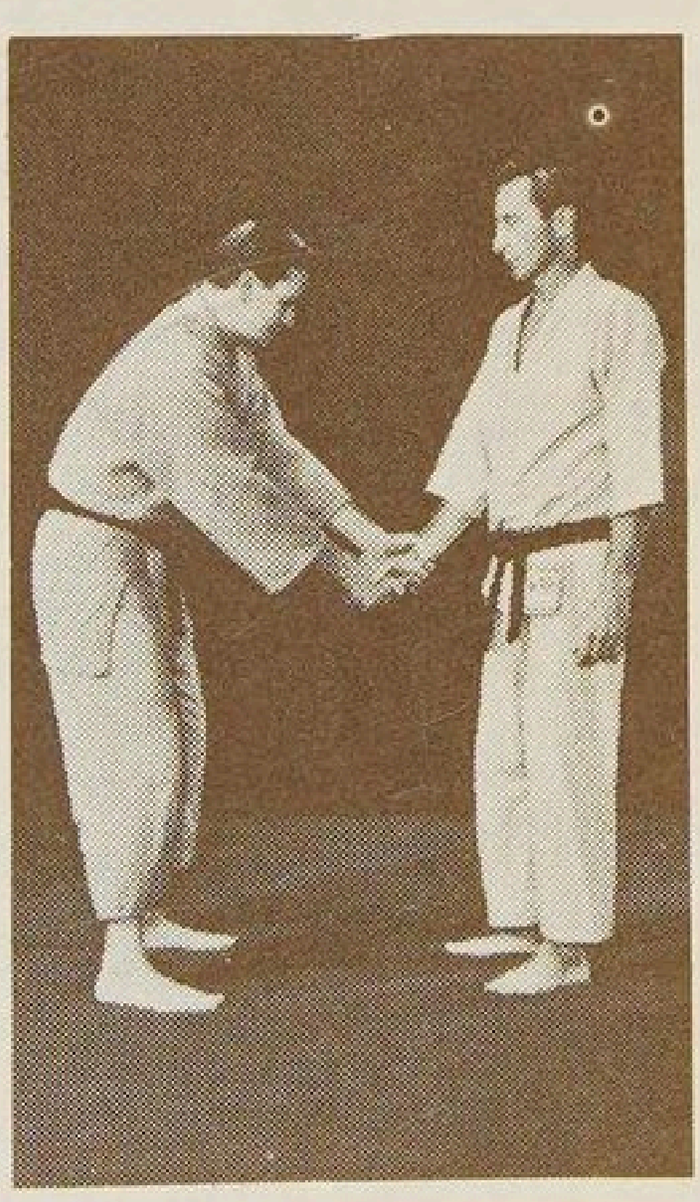
341



342

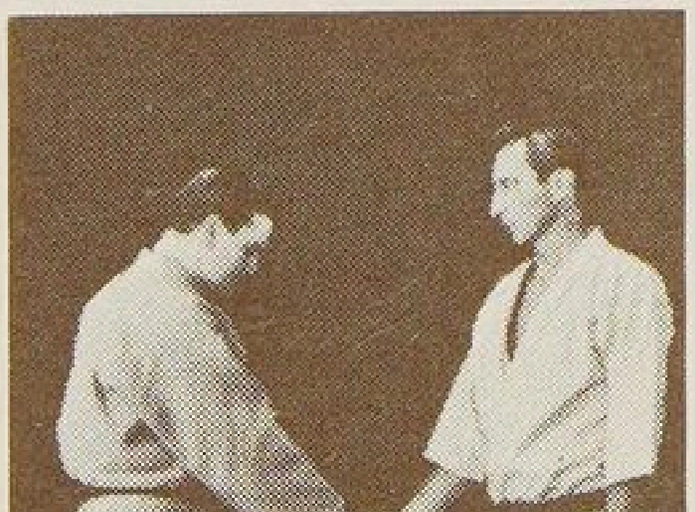


343



344

345



346

Straight Down Arm Lock

347. Left partner offers no resistance as you take a deep step forward with your left foot toward his right side and grip his right wrist with your left hand, natural grip.

348. Take a second step forward with your right foot, placing yourself close into his right side, as you reach through his captured arm with your right arm and place the bony part of your right forearm at his upper arm midway between the elbow and shoulder (at the nerve center). Pressure is applied by pushing forward with your left hand as you lever back with your right arm.

USES OF HOLDS AND LOCKS:

Showing Attack, Defense, and Takedown

Control Side Hold

349, 350. As left partner simulates a reaching attack, you apply the control side hold.

351, 352. When hold is completed, sweep his right foot with your left foot (rear, as shown), taking him to the ground as you maintain your hold with your right hand. As he goes down, your left hand slides to his elbow and pushes it toward his shoulder. Be careful to observe safety rules in practice, following his body movement with yours to avoid unnecessary pain or injury.

Chcke Hold to Side of Neck

353, 354. As right partner simulates high reaching grab, parry his reaching arm with your left hand and apply choke hold.

355, 356. When choke is taken, kick his right leg with your right leg (kick back throw), taking him to the ground, maintaining the hold and following his body action with yours. When he is on the ground, push his right arm across his neck as you continue to apply pressure against the side of his neck. Observe safety rules.

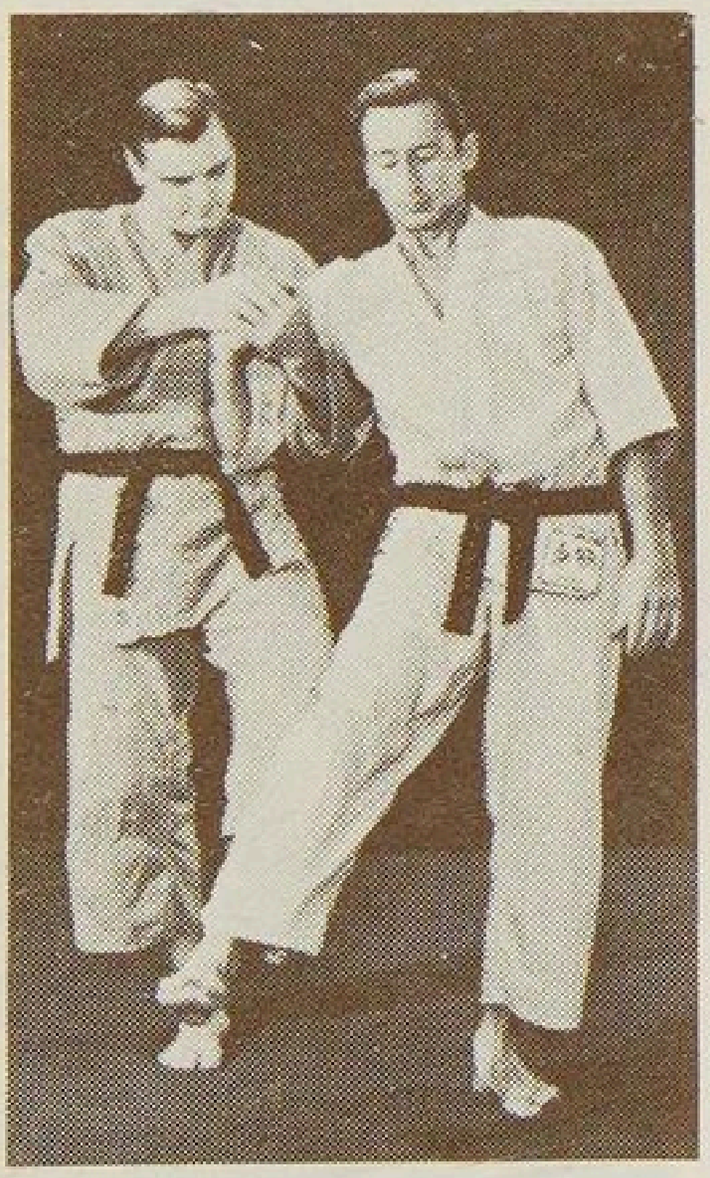
347

348

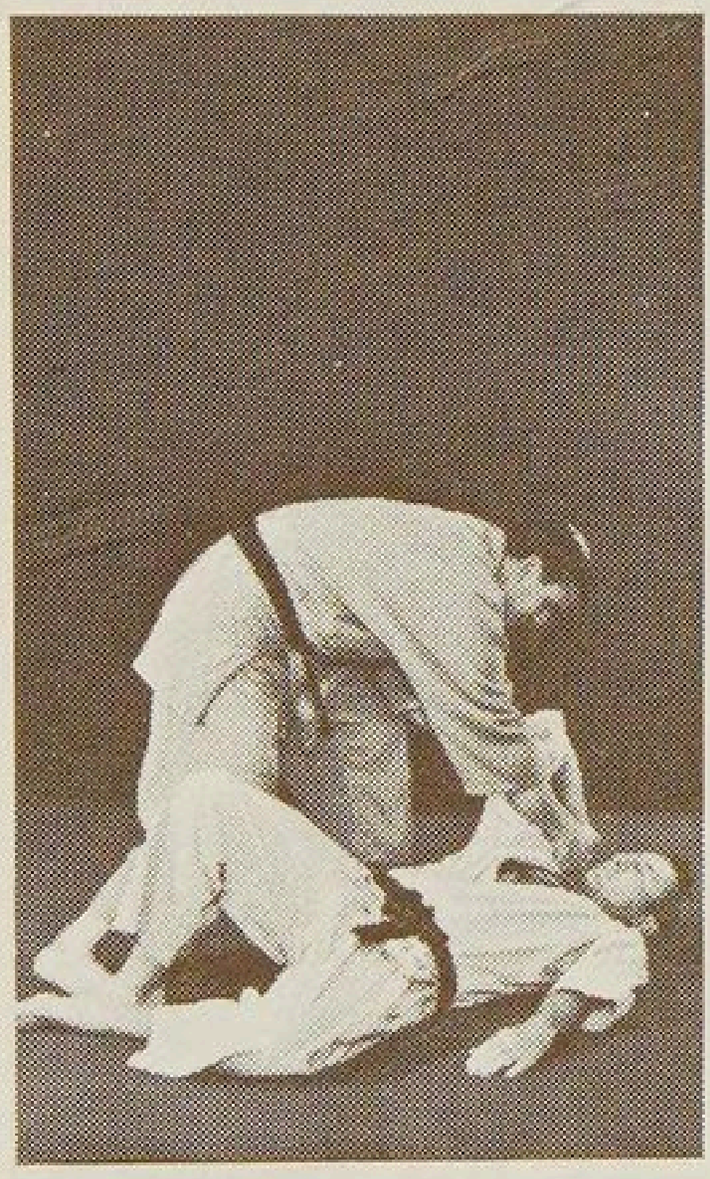
349

350

351



352



353

354

355

356

Hand and Arm Hold

357. Right partner simulates hand grabbing.

358. You apply hand and arm hold.

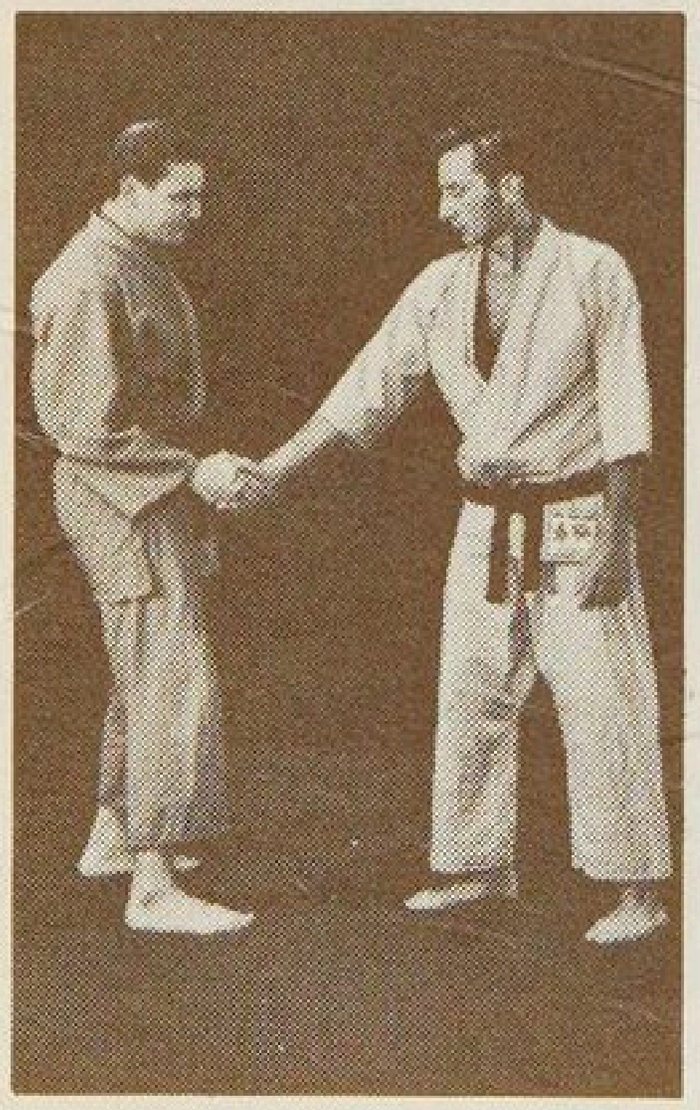
359, 360. When hold is taken, take a step around to his side and sweep his right foot with your left foot (sweeping foot throw), placing him on the ground. When he is on the ground, apply finger pressure, as shown.

Hand and Arm Hold, Cross-Body

361. As right partner simulates hand grab, apply hand and arm hold, cross-body. When hold is taken, step around to his side and apply sweeping foot throw.

362. When he is on the ground, continue to apply pressure.

357

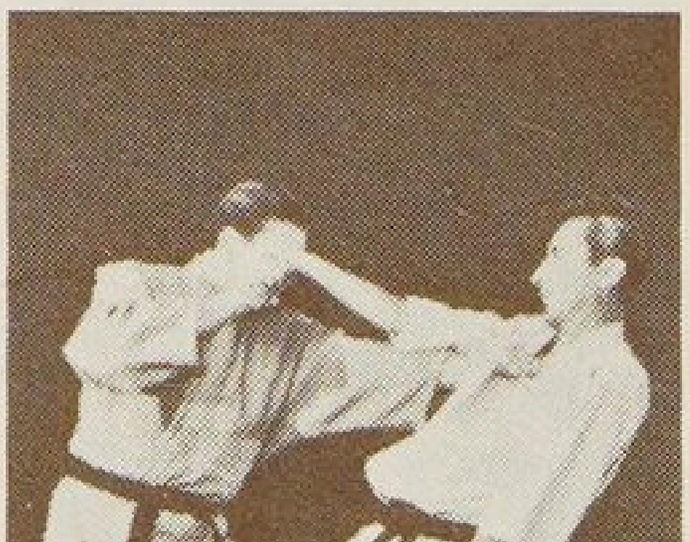


358

359

360

361



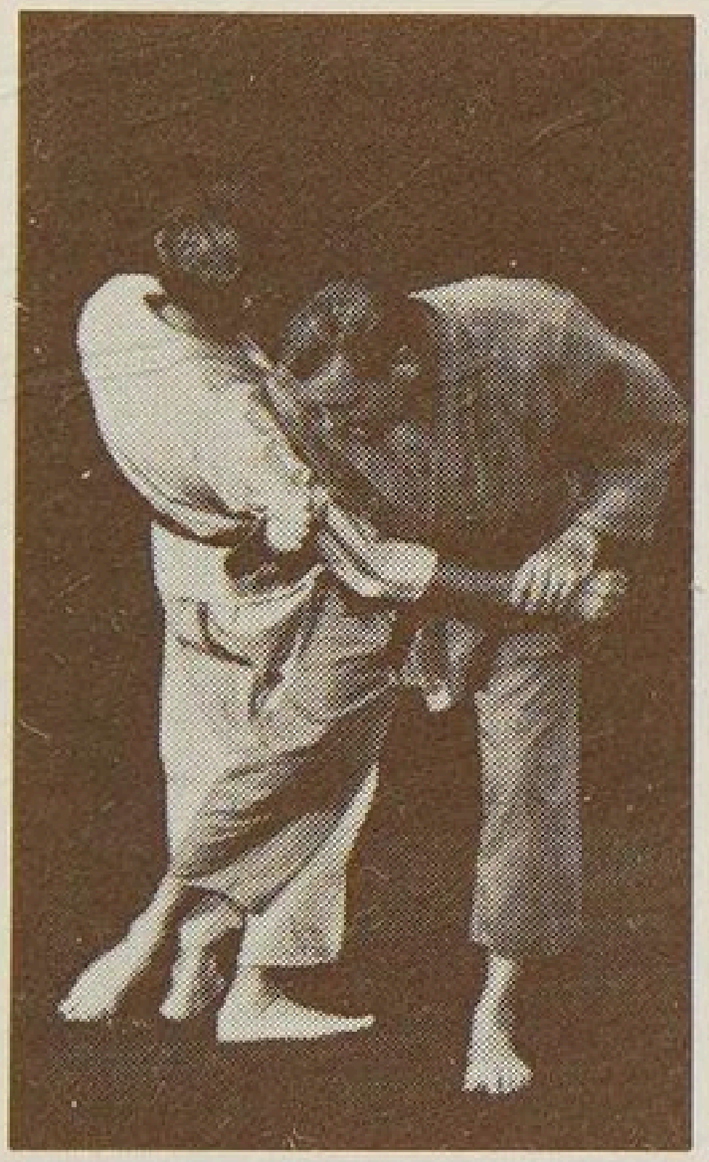
362

Straight Down Arm Lock

363. As left partner simulates low front reaching attack, apply straight down arm lock . When hold is taken, apply back trip by placing your right leg behind his legs and taking him to the ground with the pressure of your lock, aided by the action of your upper body twisting around to your left.

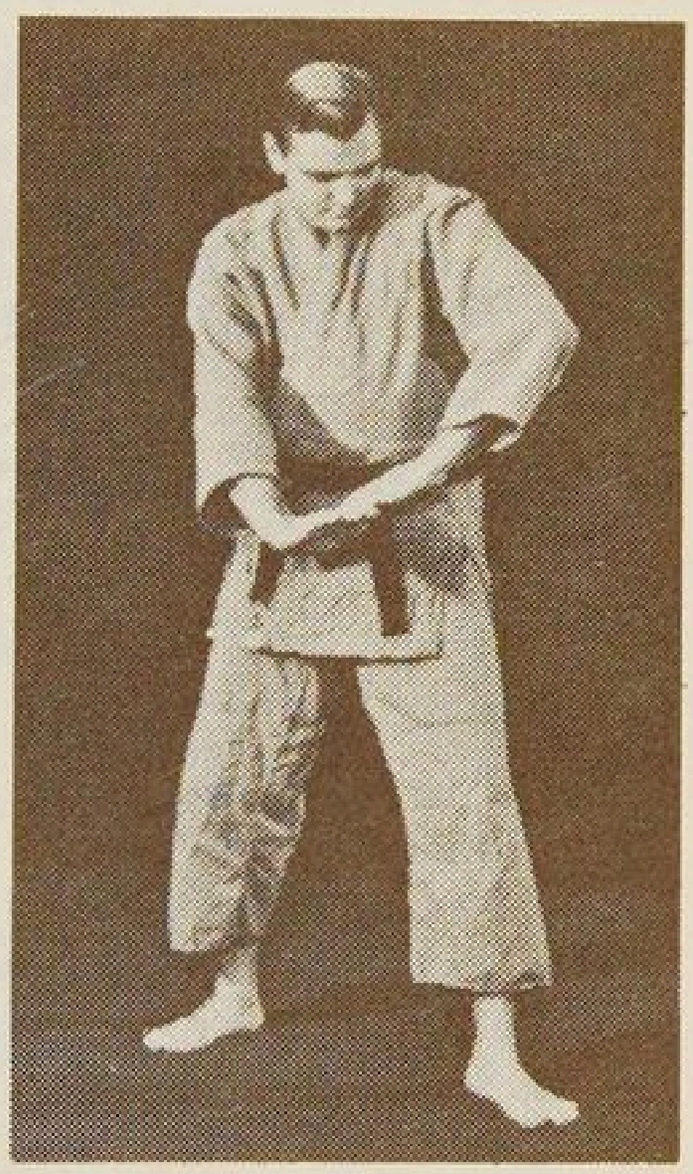
364. When he is on the ground, continue the pressure by lifting up with your right forearm and levering down with your left hand.

363

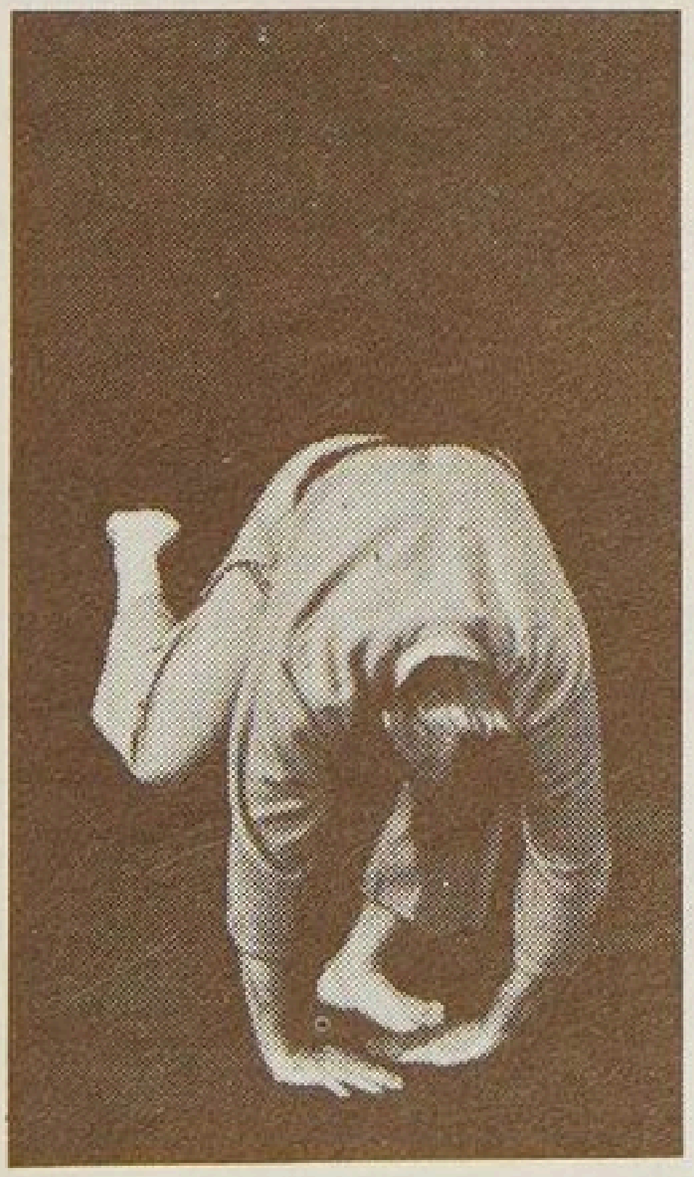


364

365



366



367

FALLS

Intermediate Side Roll

365, 366. As you take a step forward with your left foot, place your hands in the position for beginning the basic side roll and, without hesitation, put your hands on the mat and start to lose your balance over the left shoulder and curl your right leg as you roll.

367. You slap with the fully extended arm, but continue rolling forward, pushing yourself up with the right hand and right leg.

368. Rise to standing position, facing the direction from which you started the fall; assume T-position.

Intermediate Side Leaping Roll

This is a slightly advanced version of the intermediate side roll. The essential action is exactly the same; what has been added is an object over which you leap as you do the fall.

369, 370. Using any soft object for beginning practice, take three steps back from it to place yourself in the proper position. Then, stepping out with the left foot first, take three steps as you place your hands and arms in the correct position.

If you make fists of your hands and think out the direction of the roll before you do it, it will help your technique. The *sides* of your fists make the first contact with the mat and your roll is in a diagonal line from your left fist, across your left arm and shoulder, and across your back toward your right hip.

When you begin practice of this fall, take just a small leap over a low object. Increase the height of the object only when you can do the fall without jarring your shoulder or back. A common error is to allow the left arm to crumple instead of giving support to the rolling body; you should actually feel that the left arm gives you support although you are not to hold it rigid.

This fall is compleeded by continuing up to a standing position.

Forward Fall

Unlike the other falls, which have both safety application and are useful for practicing the throwing techniques, this fall has only a single function: it is a safety fall. If you are pushed forward or trip or slip, this fall could prevent serious injury. Even though you might feel some pain if you fall on hard surfaces in this manner, you will not hit your head or break your wrists or elbows, the common result of forward falls.

Preliminary practice: Until you have acquired the knowledge of the exact position of your hands and arms, you must practice from a kneeling position.

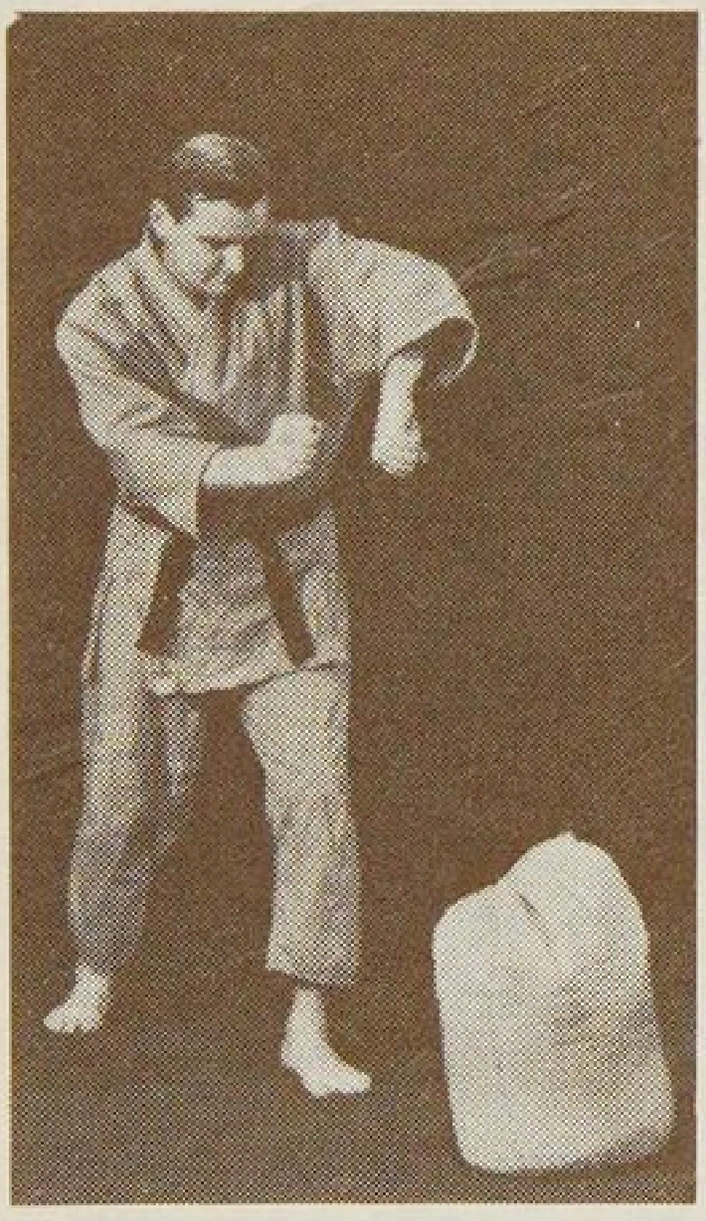
371. Kneeling on the mat, swing your arms upward for rhythm and timing.

372. Lose your balance forward and slap the mat with your forearms as shown. Your arms are at a right angle so that your hands are directly beneath your face, fingers somewhat cupped, wrists *not* bent, body raised from the mat as pictured. You should feel no jarring in the shoulders or neck when your timing and slap are correct. Do not proceed to practice this fall from a standing position until you can do this version of it quite comfortably.

373. From a standing position, raise both arms as you lose your balance forward.

368

369

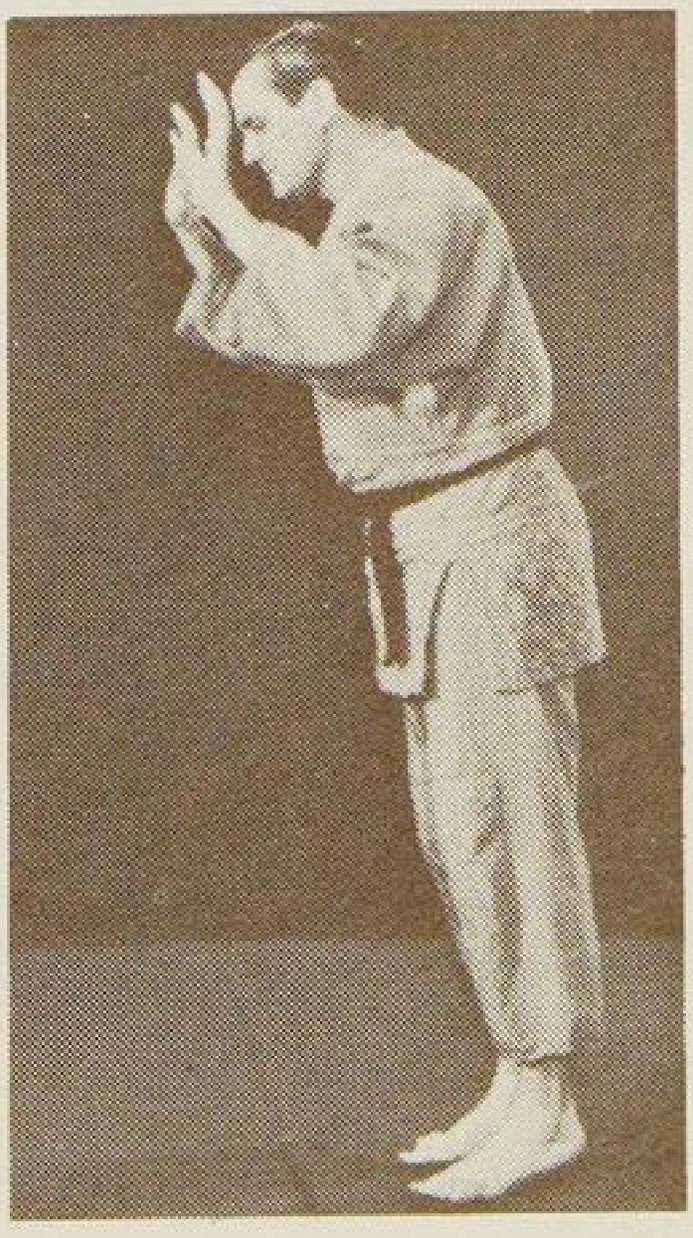


370

371

372

373



374. The finishing position is onto your forearms and toes, as pictured, with the rest of your body completely off the mat.

THROWS

Lateral Dash Throw

Because you must place yourself onto the ground to use it, lateral dash is among the throws known as sacrificing throws. It is not wise to choose lateral dash if you are in a position to apply non-sacrificing throws, but there are some situations in which sacrificing throws work best: If you are being pushed backward or being pulled down or in any situation where your opponent's weight is coming forward heavily, lateral dash could be ideal.

375. To show an example of appropriate use of lateral dash., partner at right simulates choke in which he has your body badly off balance backward.

376. Rather than oppose his heavy forward movement, first break the choke using the clasped hand upward action, shown.

377. Then, grip cloth at both his upper arms as you sidestep with your left foot to place yourself out of the direction of his fall, and place your right foot onto his left instep. Your left foot is pointed toward him and your arms begin their forward pulling action from the instant you grip cloth.

378. Continuing the pulling forward with your arms, sit down off to the side of him as he begins to fall forward. For training, you let go of your partner when he is in the middle of his fall, allowing him to take a safe and proper fall. In self-defense, holding onto an adversary throughout the fall would make him fall onto his head.

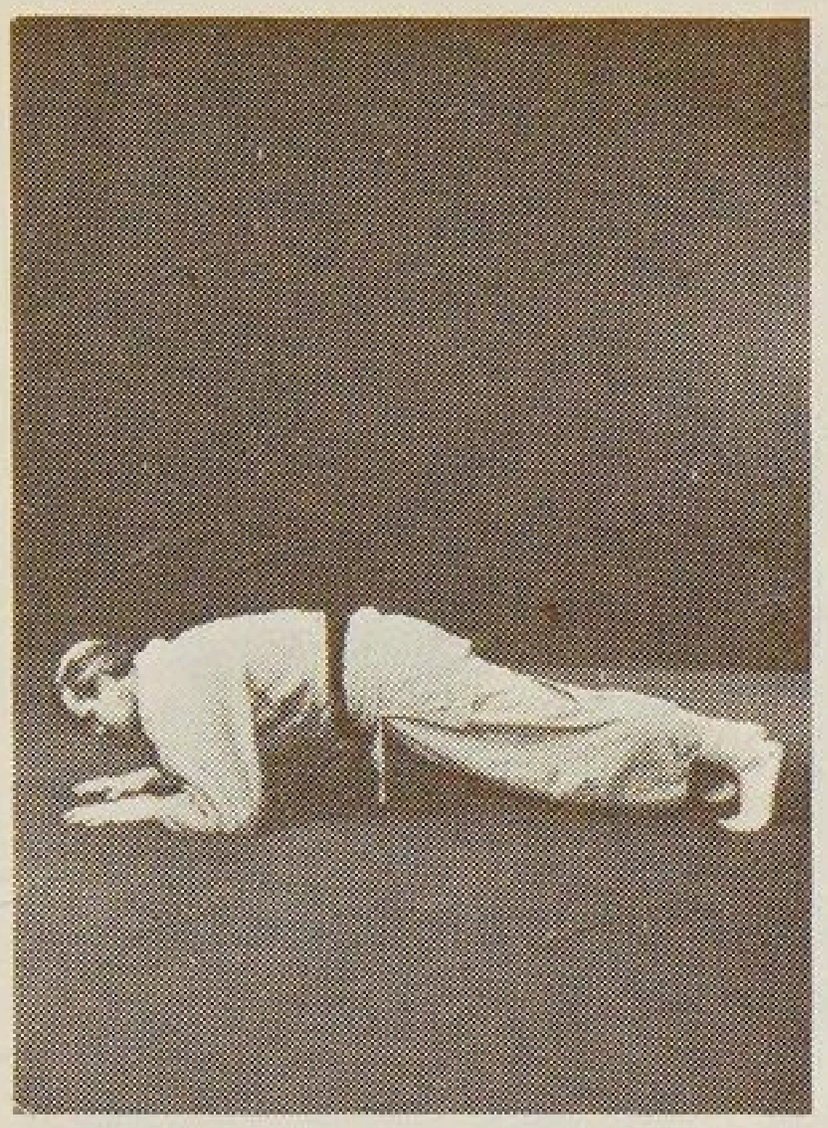
Inner Hook Throw

379. Right partner simulates fist-fighting attack when you block-slash.

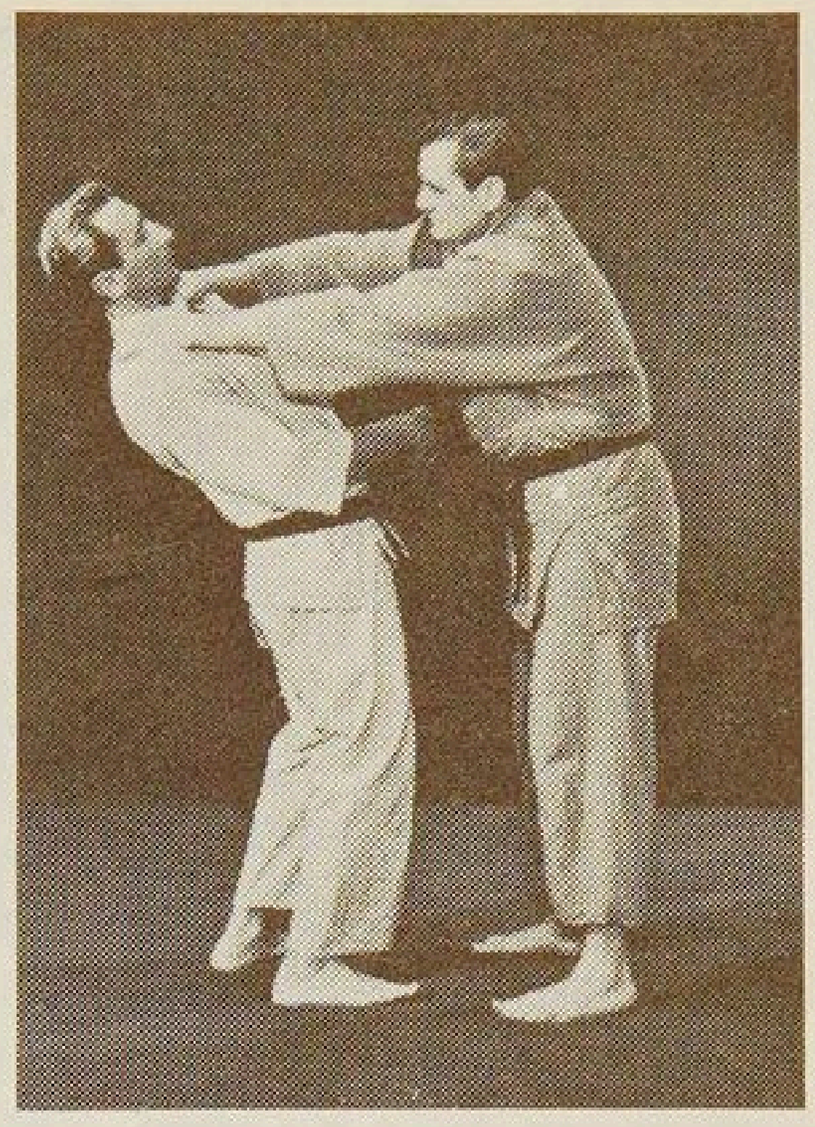
380, 381. Then, gripping cloth at both his upper arms, pushing him back into weak balance, hook your right leg inside his left leg and pull the captured leg sharply out from under him as you twist his body into the direction of no support.

In actual self-defense, you would follow the first slashing blocks with additional hand and foot blows, applying the inner hook throw at whichever leg is forward. At the completion of the throw, you should move around toward his head to avoid being kicked.

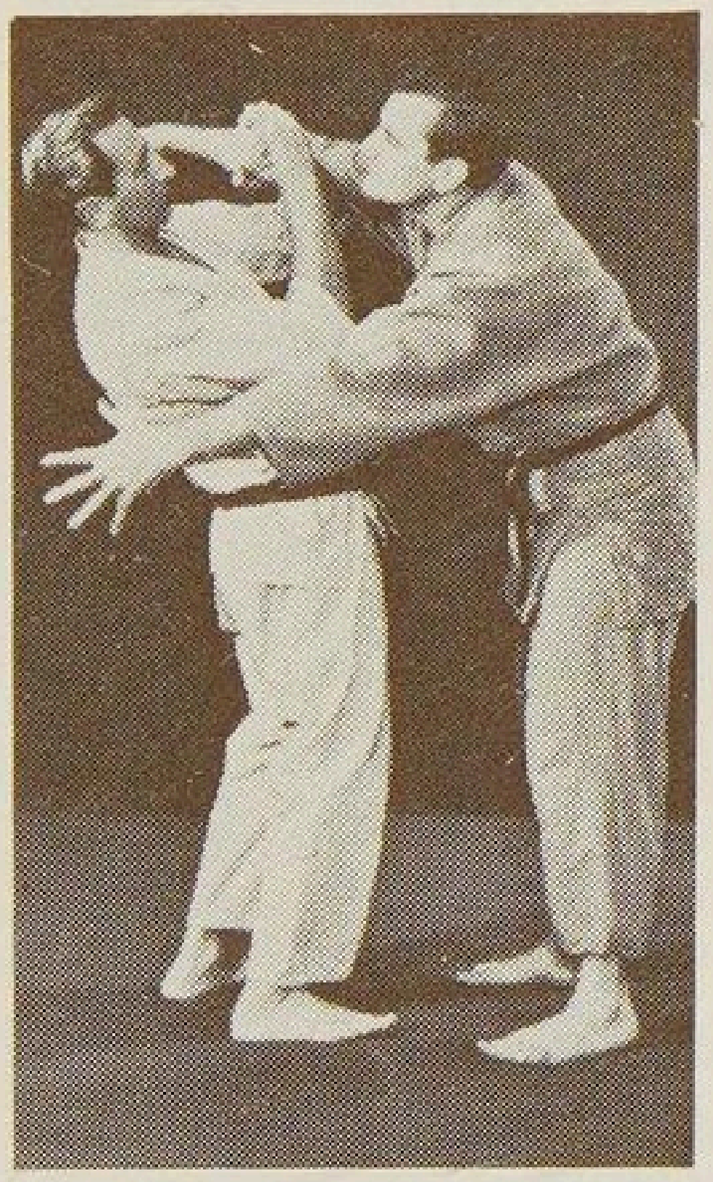
374



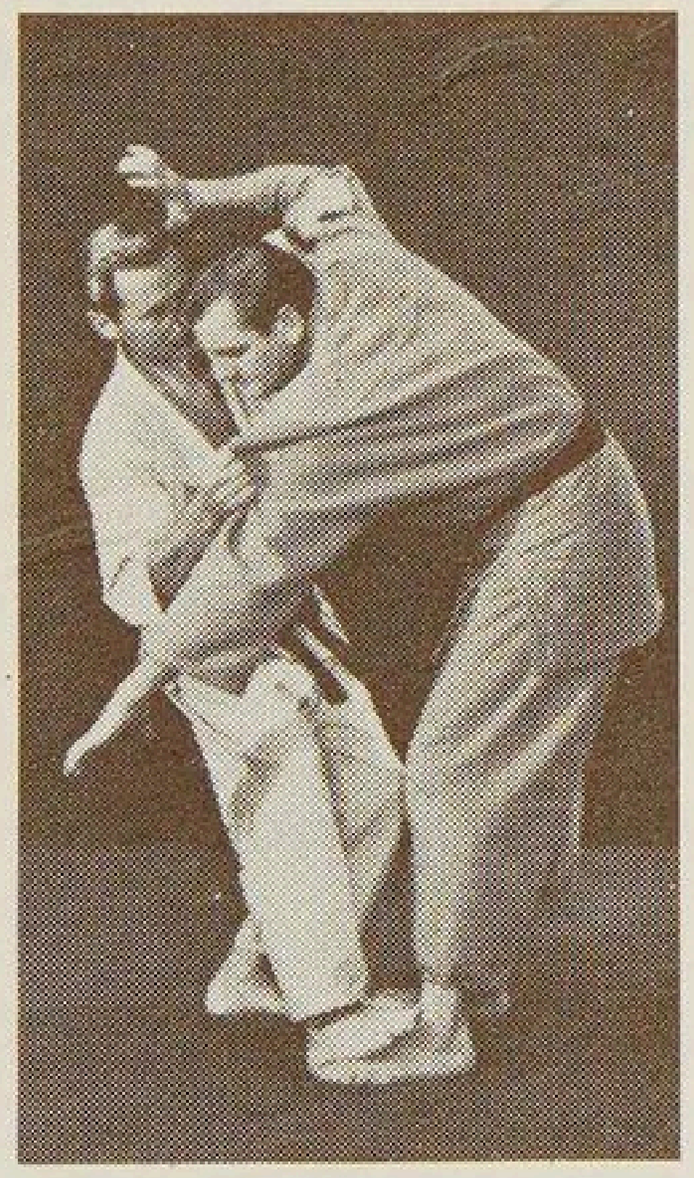
375



376



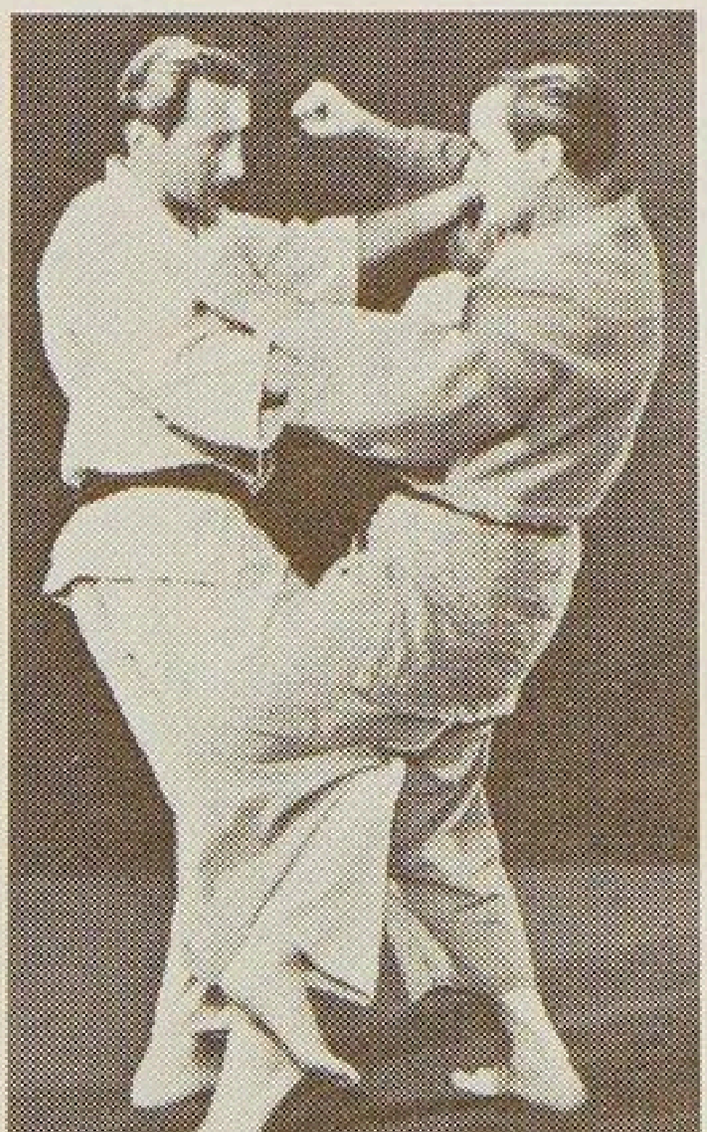
377



378

379

380



381

Over Shoulder Throw

382. Left partner simulates attack; you slash-block and complete the pre-throwing action.

383. Pivot on the ball of your left foot, turn counter-clockwise as you grip cloth at his right upper arm with your left hand as you reach under his captured arm with your right hand.

384. At the completion of the turn, you should be directly in front of him, your feet in front of his feet; your right hand grips cloth at his right arm at the shoulder. Squat slightly, lean your upper body left and begin to pull him forward (not around).

385. Complete the throw by continuing the pull forward until his feet leave the ground and his weight is on your hip; then, spring up and straighten your legs as you twist sharply down and around to the left with both your arms.

DEFENSES AGAINST ATTACKS

Front Choke — Defense Number 2

386, 387, 388. Right partner simulates front choke. You cup your right hand slightly and strike from the inside against his right forearm, following this action immediately with the same action against his left forearm with your left hand. The action should be practiced in this fashion when you begin but advance to the use of both hands simultaneously when you can. The action is not a pushing or shoving type of movement, but a snappy, vigorous movement.

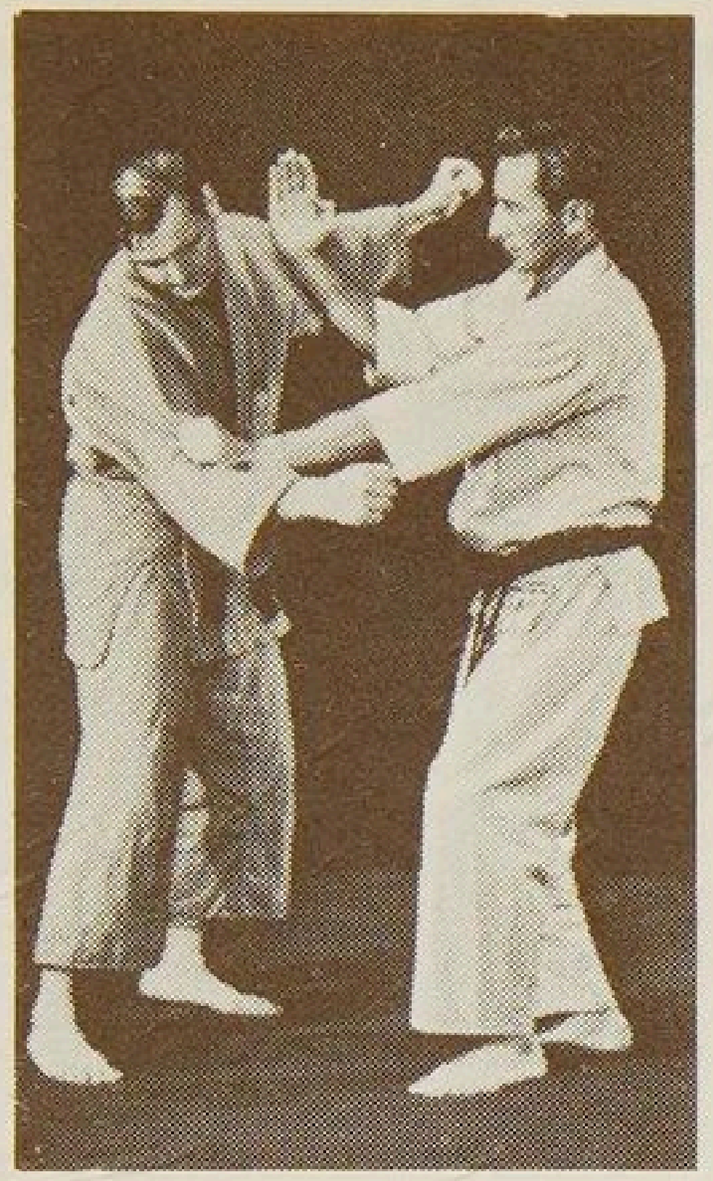
389. When release has been effected, retaliate with hand and foot blows as needed.

For the test, one retaliatory blow is simulated after release.

Close-In Fist Attack — Block and Leap Defense

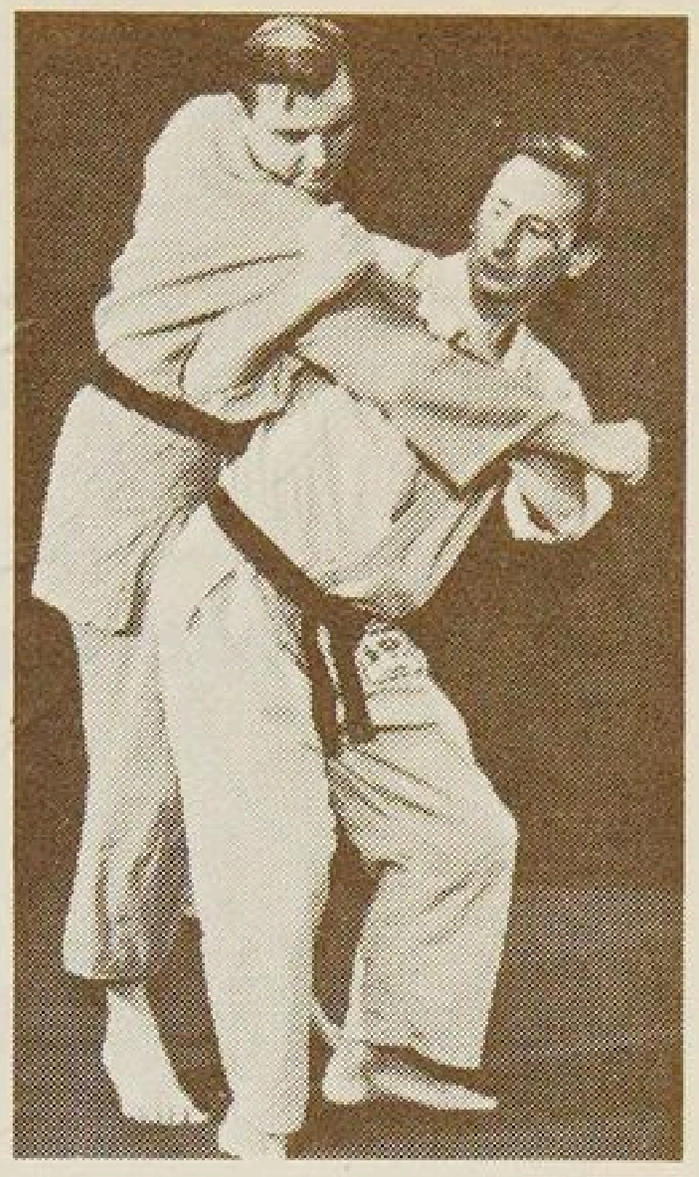
390. Right partner simulates a fist-fighting attack which you slash-block against both arms.

382



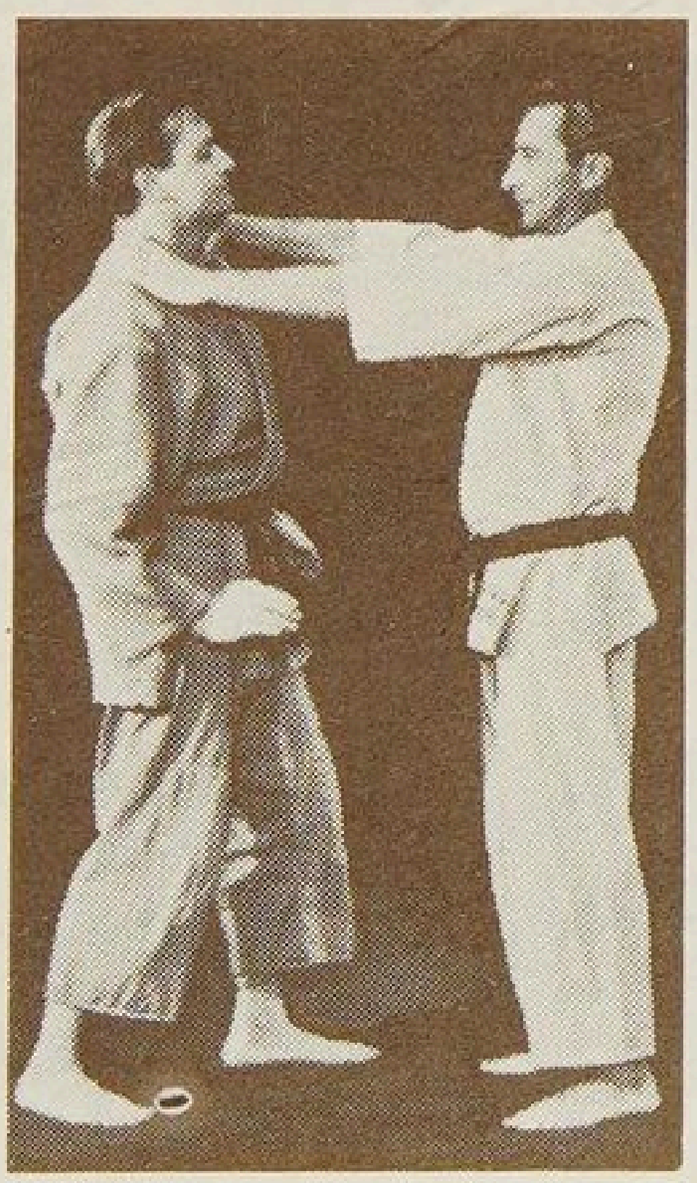
383

384

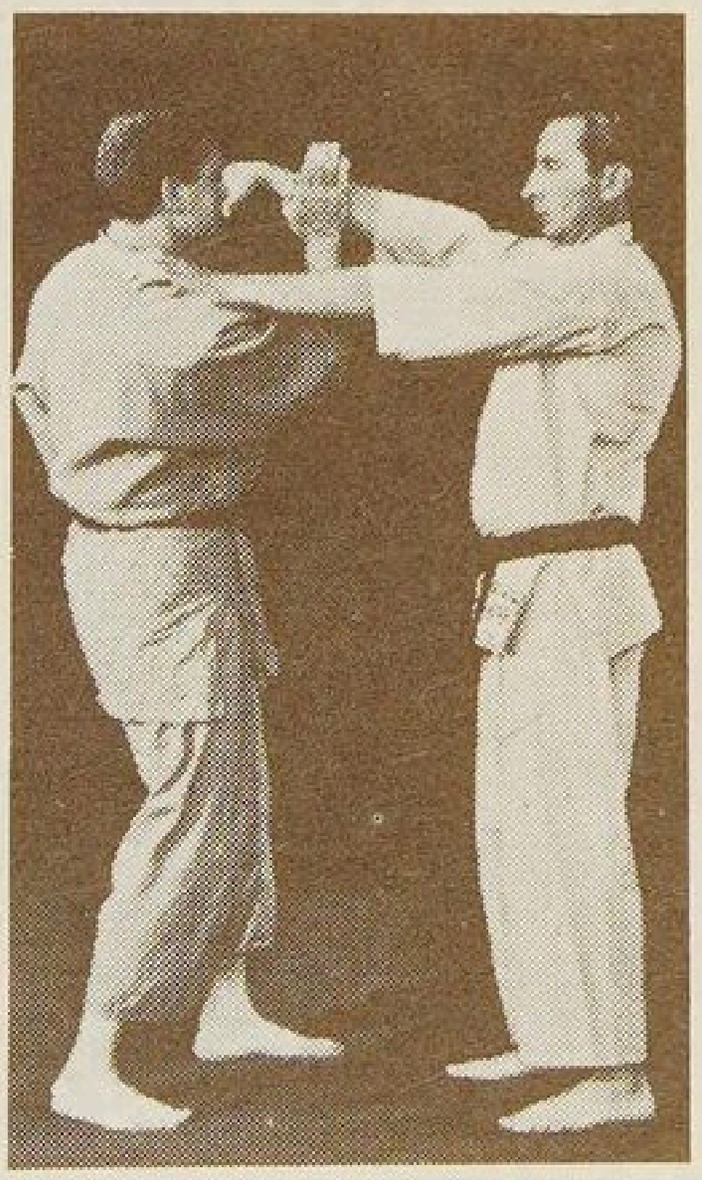


385

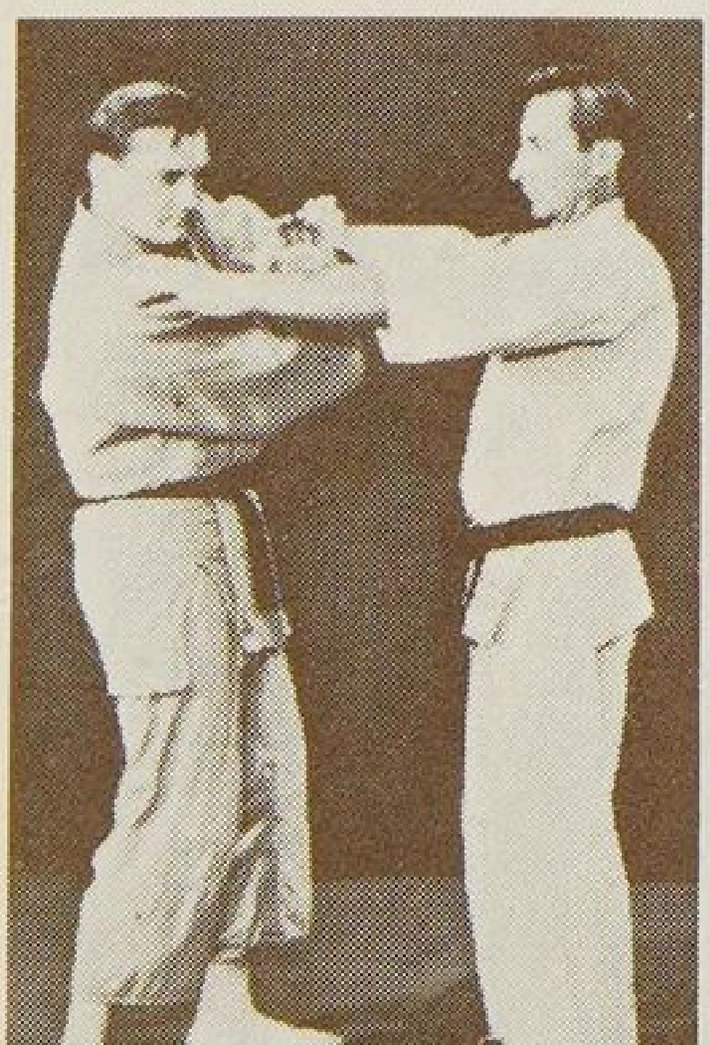
386



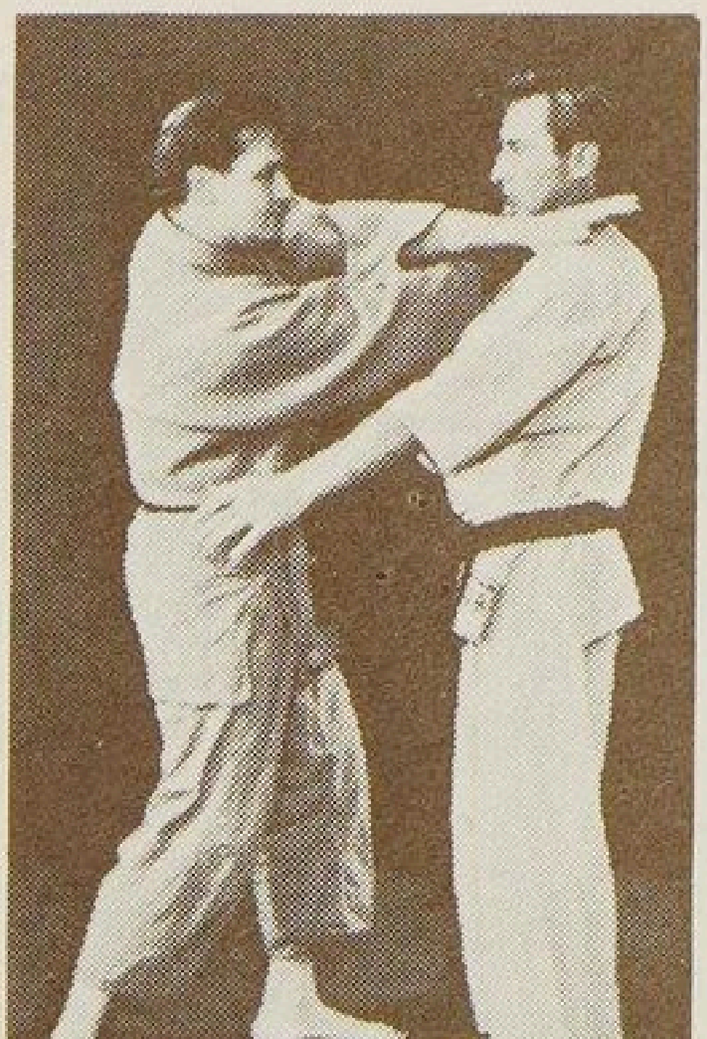
387



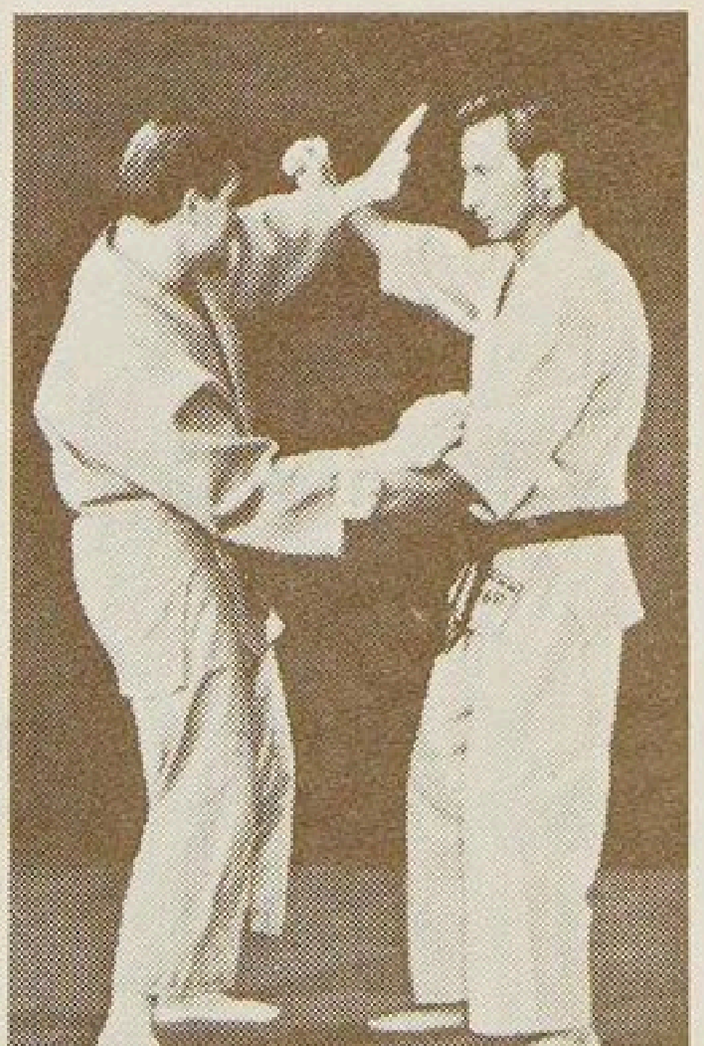
388



389



390



391, 392. Then, you leap back just far enough to be out of his fist range although still within kicking range for retaliatory blows.

393. Continue to kick, working your way around to the rear of your adversary; continue hand and foot blows as required.

The test demonstration requires use of multiple retaliatory blows before resuming on-guard stance.

Fist Attack — Out of Range

394. Your partner, right, simulates threat of fist attack which he starts from out of arms' length. This is a realistic situation; an adversary, especially one who feels that he has the advantage over you, will come in swinging, revealing his intention to attack before he is close enough to hit.

395. Without waiting for him to get into hitting range, leap out to the side of the lead arm . . .

396. . . . and immediately kick with force into his knee. Continue hitting and kicking.

397. Finish by gripping the back of his collar and pulling him backward as you kick into the back of his knee, effecting a back takedown.

The takedown is part of the test demonstration.

Rear Finger Choke

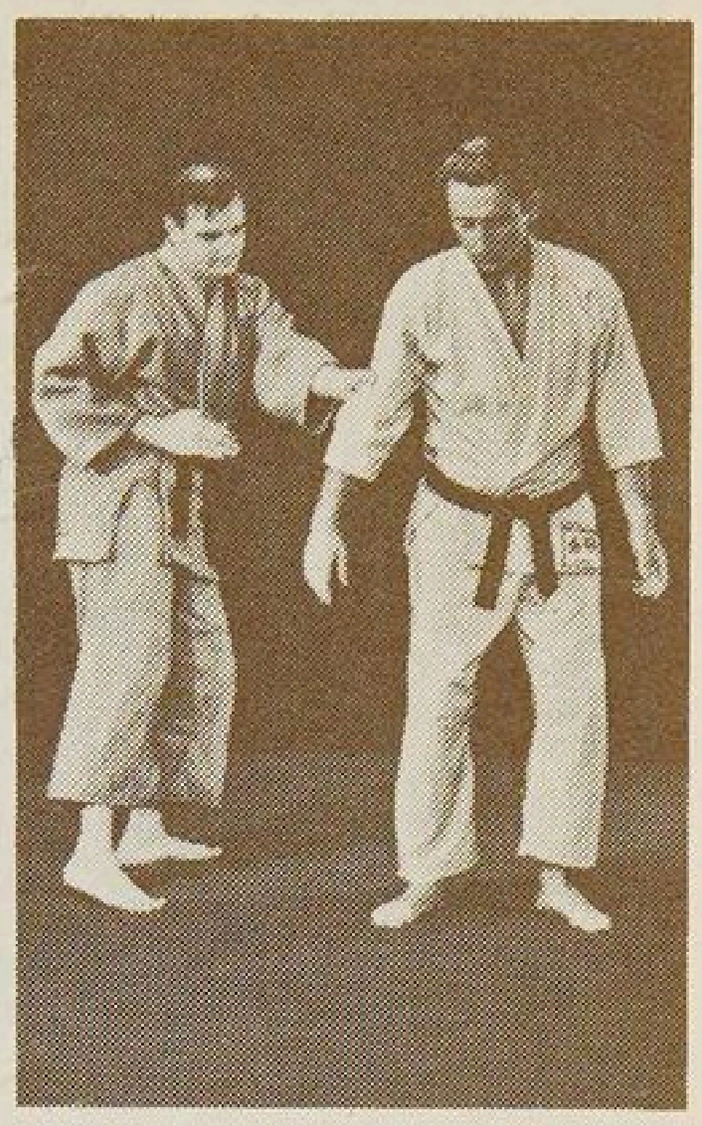
398. Partner at right simulates choking from behind, using finger pressure at your throat.

399. Grip the little fingers of both his hands and jerk sharply outward. It is easier to grip the little finger, it is weaker in its grip and jerking at it causes sufficient pain to effect a release.

391

392

393



394

395

396

397

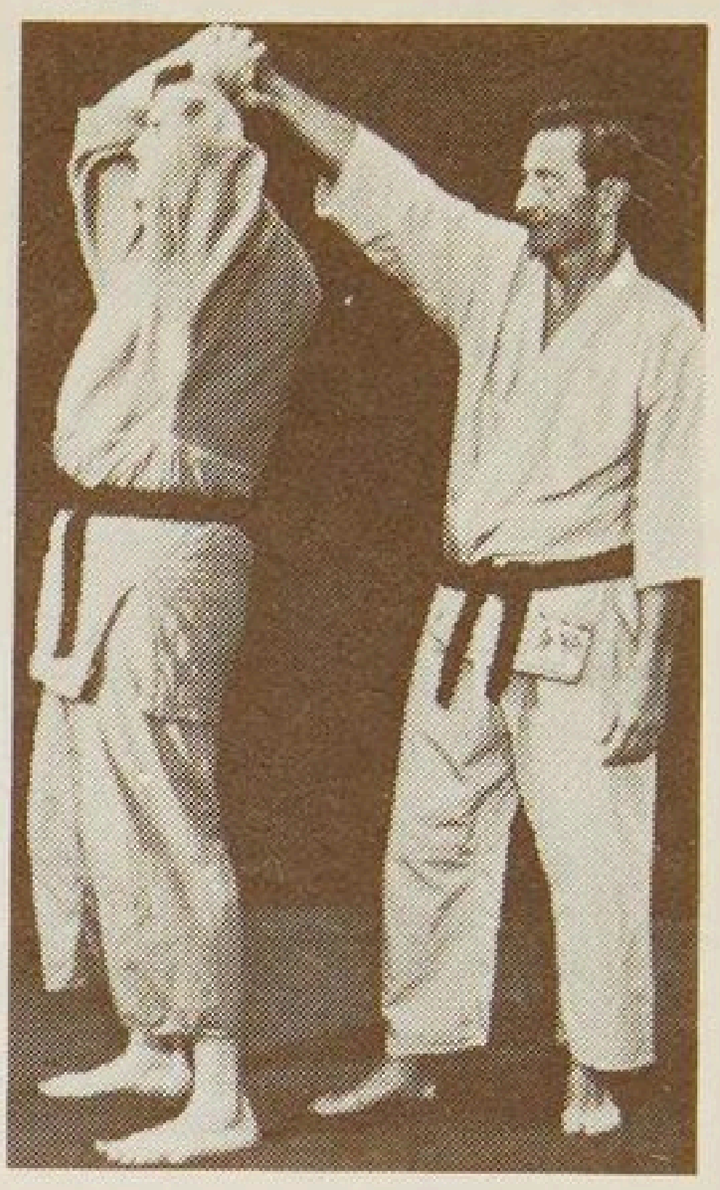
398

399

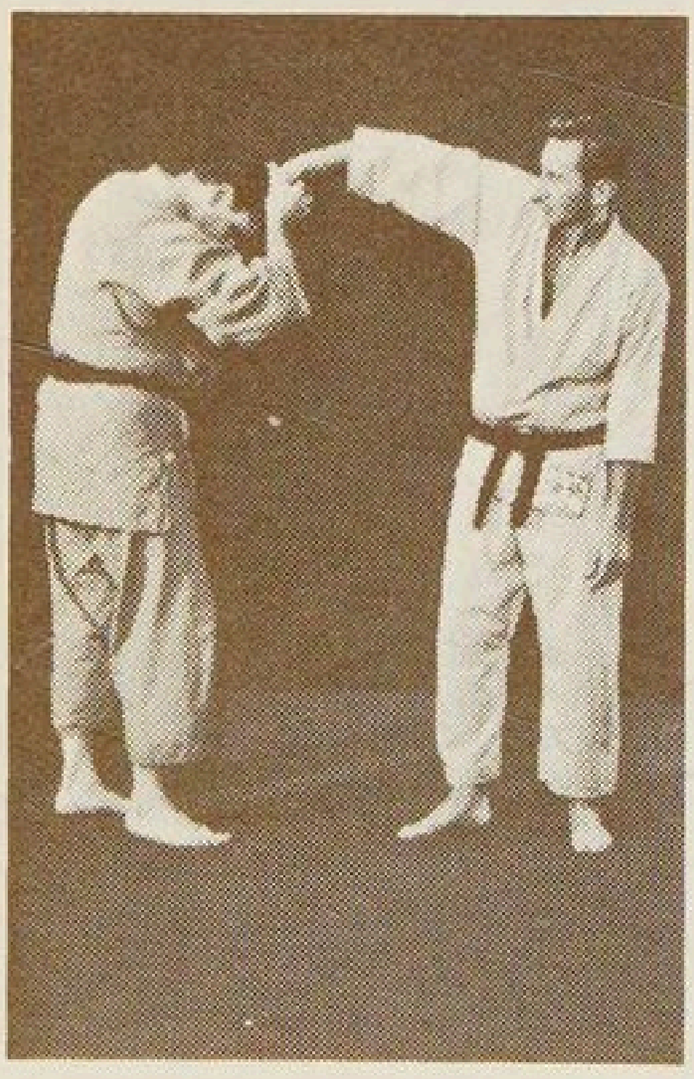
400

401

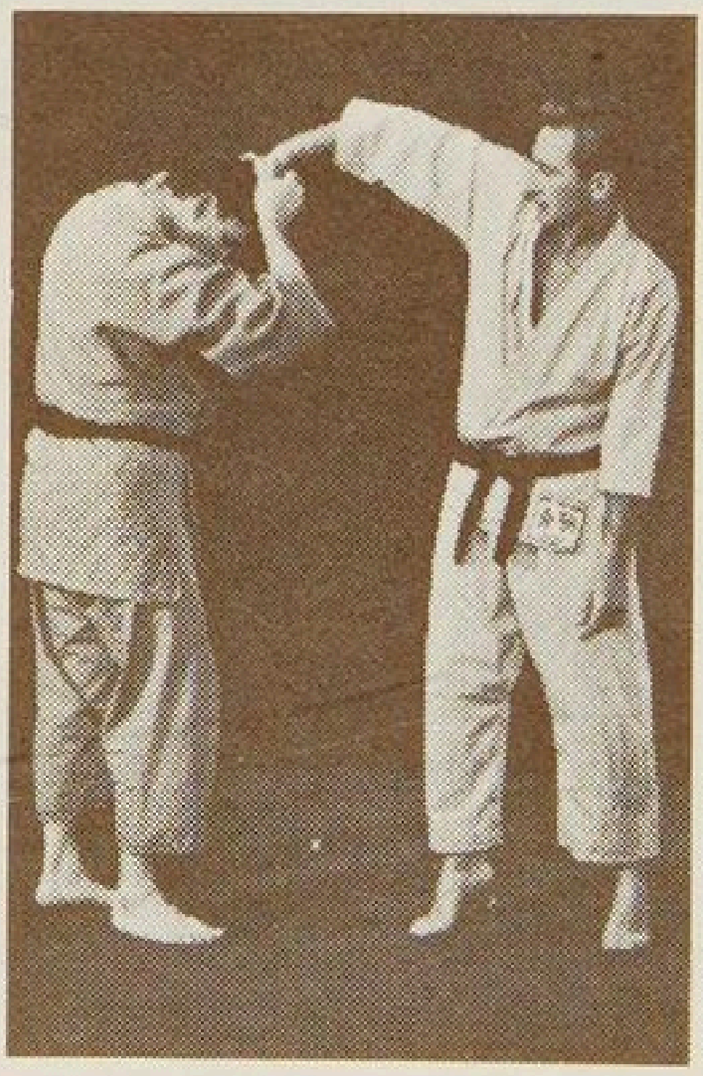
402



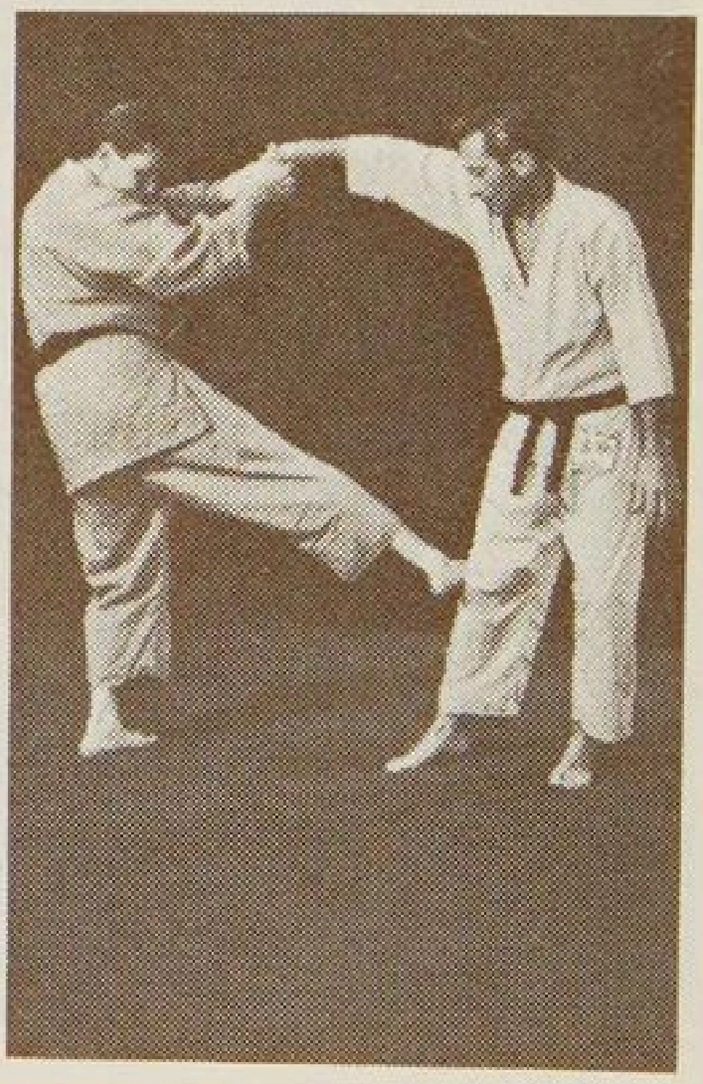
403



404



405



400. Maintain hold on one of the fingers, let go of the other and turn around to face him as you kick into the knee or shin. Continue with hand and foot blows as needed.

For the test, after release, simulate one retaliatory blow; assume fighting stance.

Hair Pulling Defense

401. Partner at right simulates grabbing hair from the rear.

402. With both your hands, press down onto the pulling hand and push it down onto your head; this relieves the pain.

403. Maintaining the push on his hand, twist around to face him, twisting his wrist as you turn.

404. Apply pressure at his wrist by raising your head.

405. When he lets go, kick into the knee or shin, if required. Apply additional hand and foot blows as needed.

For the test, one retaliatory blow is enough.

Shoulder Grab Defense

406. Right partner grabs your shoulder from the rear.

407. At the instant you feel his touch, turn to face him as you slash-block and kick simultaneously. You should get into the habit, throughout your practice, of looking at your target. Although your response to shoulder-grabbing ought to be quick, you do not want to hit at a friend who does not intend to attack you.

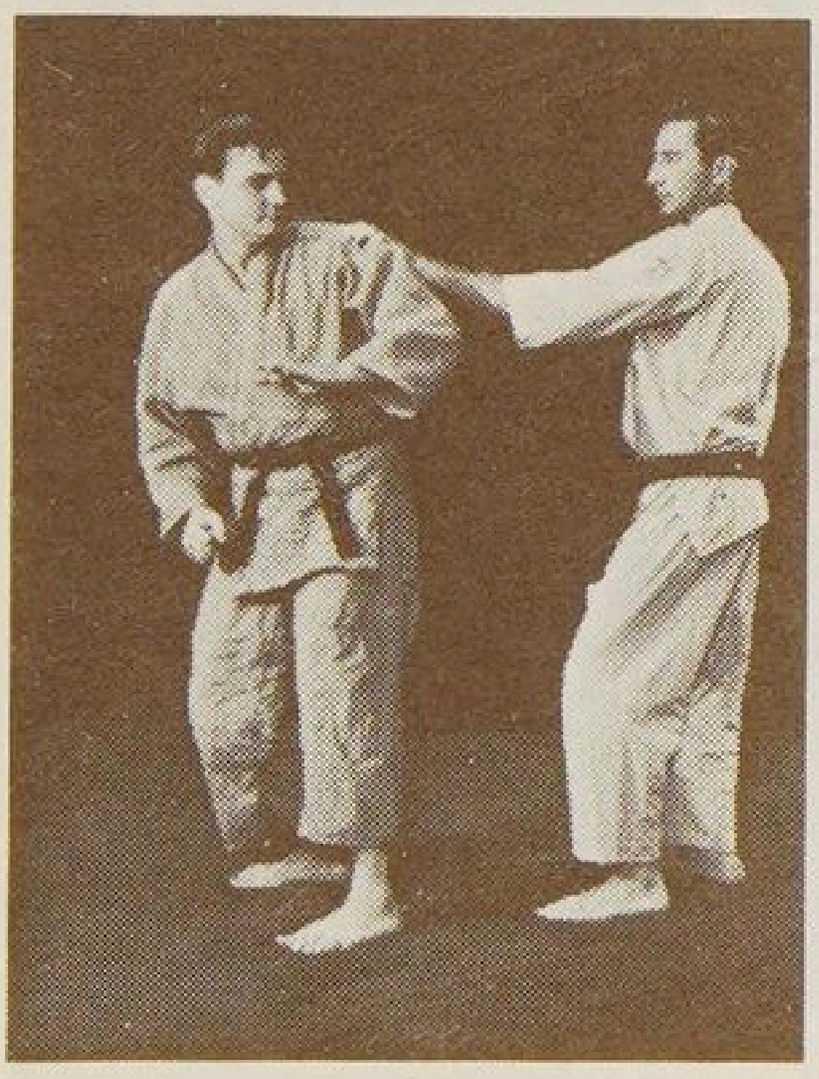
Club Attack — Side Swing

408. Left partner simulates swinging club (or stick) attack.

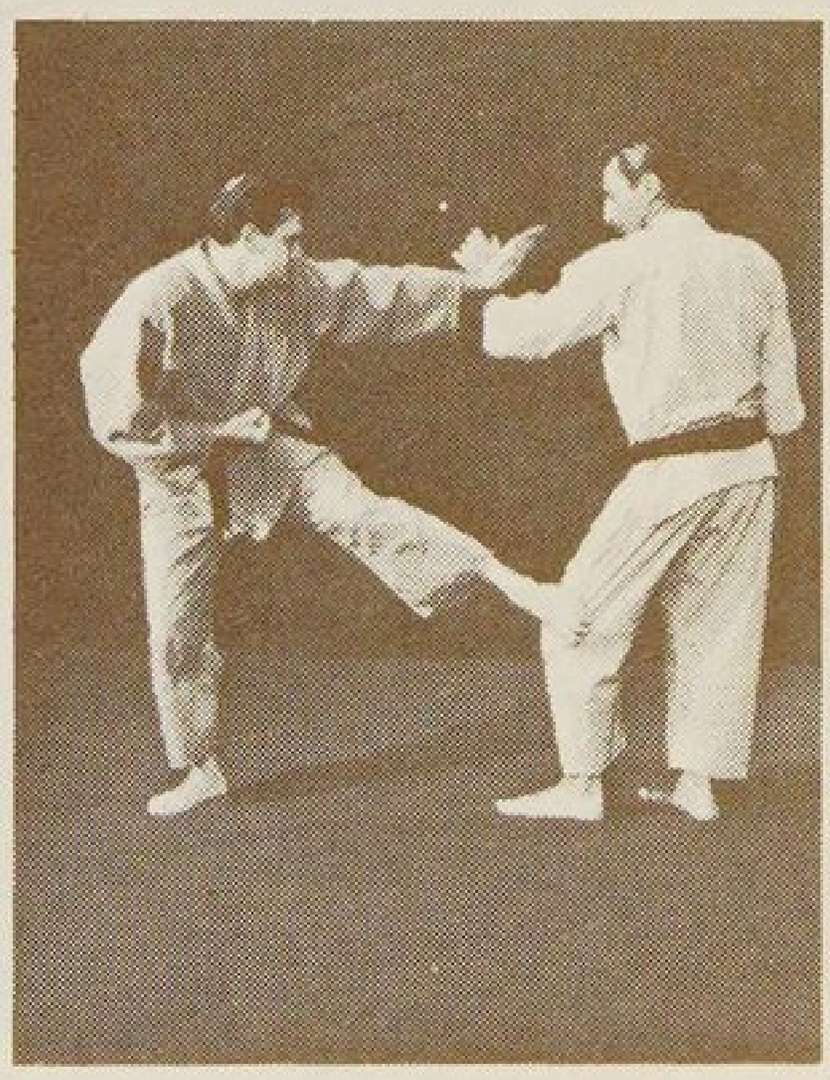
409. As the weapon approaches, step in deeply as you block his hitting arm with both your forearms.

410. Capture his hitting arm under your arm, grab cloth, and pin his arm so that it is immobilized.

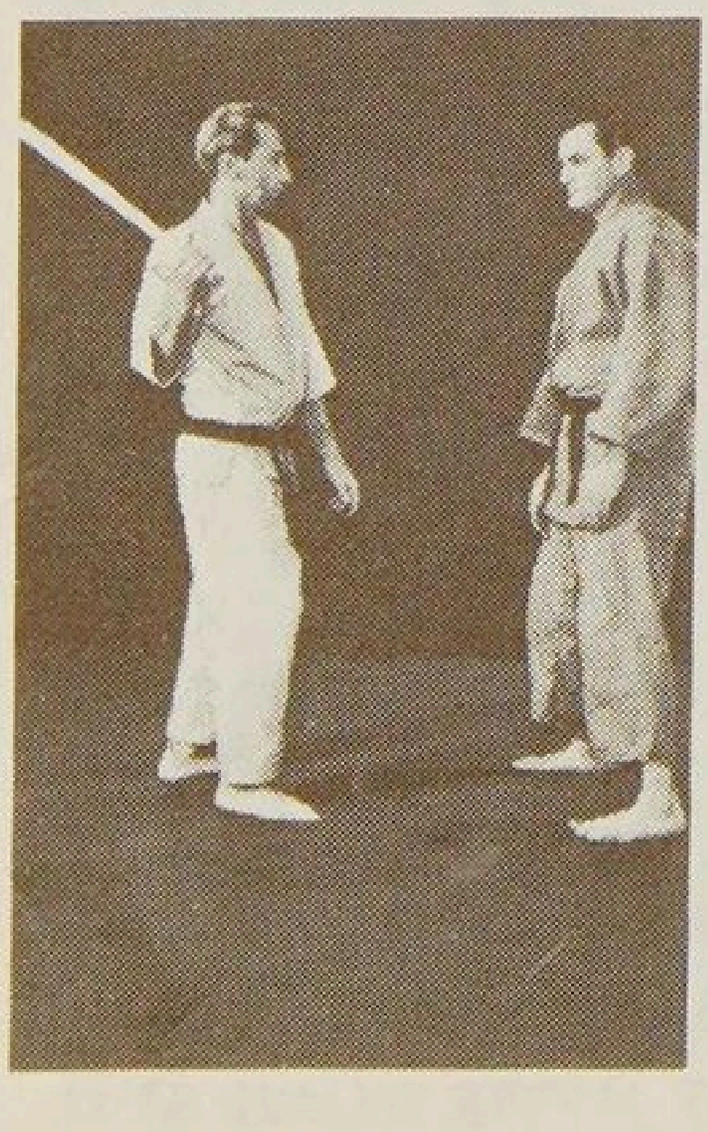
406



407

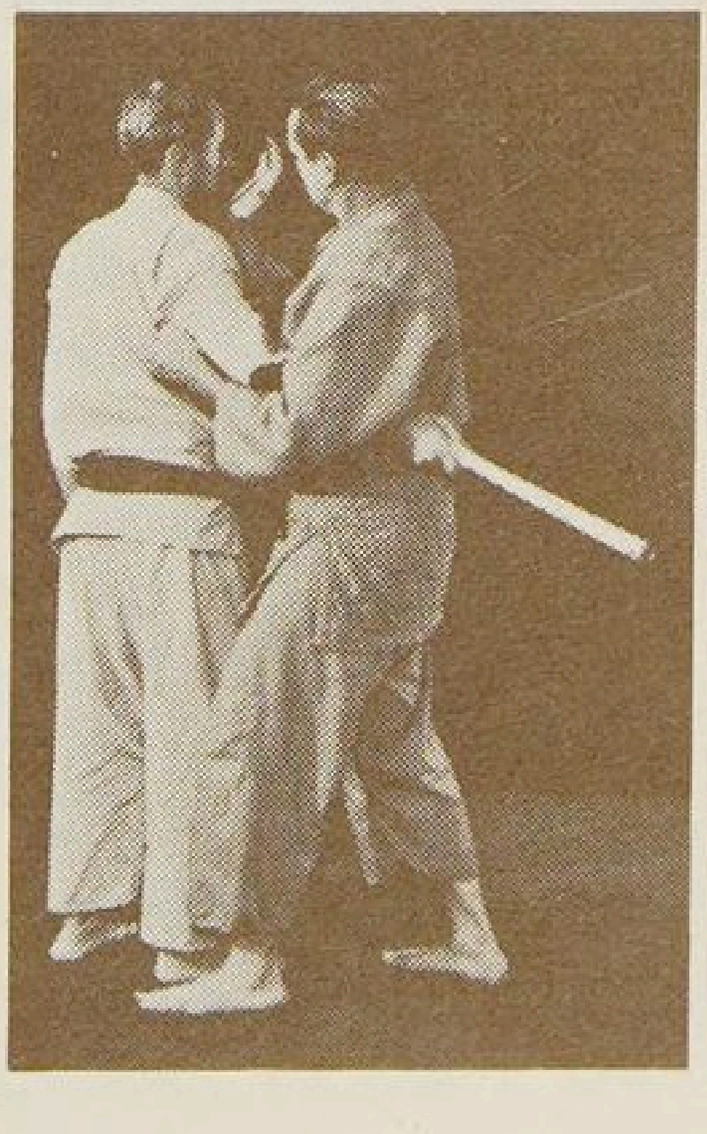


408



409

410



411. Strike upward under his chin as you place your right foot behind his right foot to allow you to apply a back trip.

The test does not require the actual takedown.

Knife Attack Threat — Low Crouch Style

Reread "An Armed Assailant: When to Defend."

412. Left partner simulates threat of knife attack using a low, crouching style.

413. Distract so that his attention is diverted high.

414, 415. Using the edge of your shoe, deliver a swinging kick at his knife *hand*. With shoes on there is very little danger of being cut. Using a kick against the knife hand (not the knife) is very much safer than trying to grab or grapple with him, or trying to block or parry. Using the kick is more effective and safe. You need only be moderately proficient to use waist-high kicks. After the first kick, which should deflect the knife hand, immediately kick into the knee with force and continue kicking until he is visibly weakened or drops the weapon.

416. When he is visibly weakened, grip his arm with both your hands and lock it out away from you as you continue to kick until he is on the ground or injured. Do not try to take the knife away from him until he is very obviously subdued or injured.

No takedown is necessary for the test.

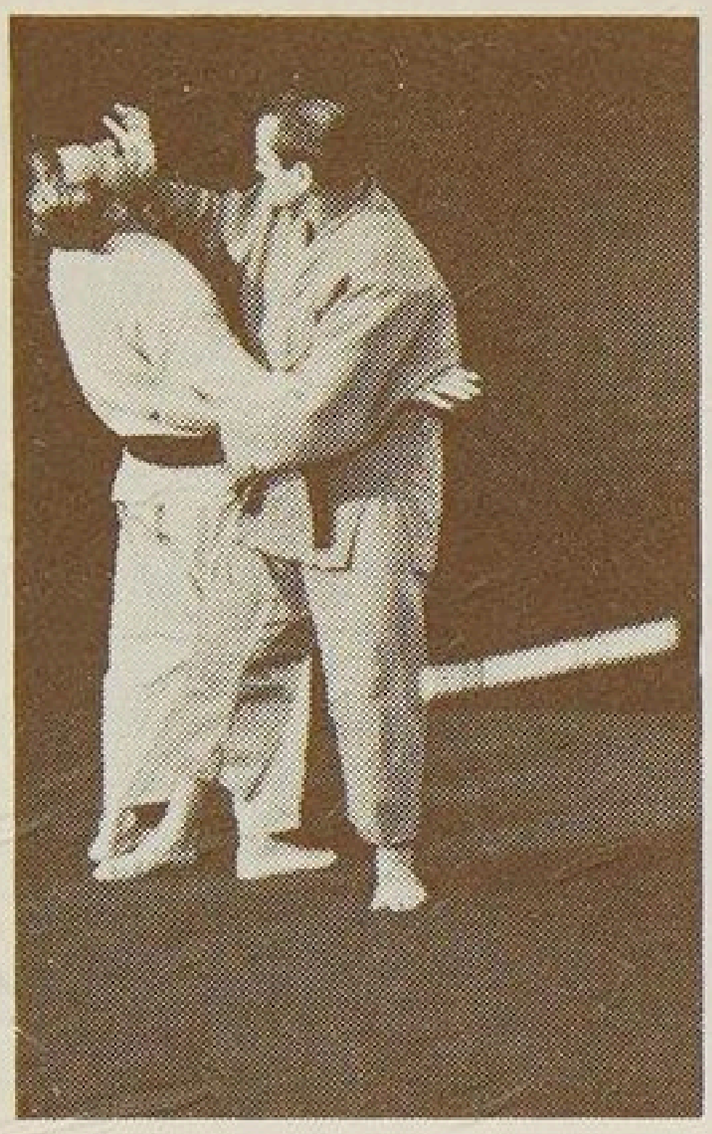
Knife Attack Threat — High

417. The threat of attack, simulated by left partner, is made by pointing the knife tip at face or throat.

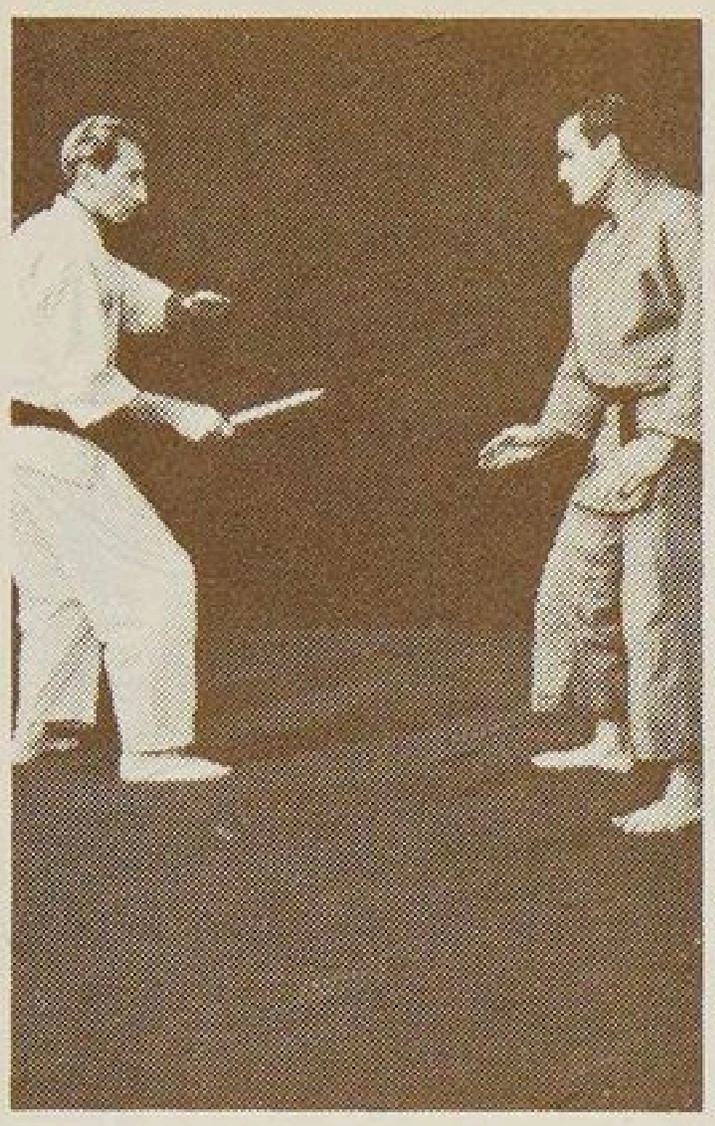
418, 419. The distraction used here is somewhat different from the previous kinds of distraction you have used. In this instance, you are not only diverting his attention momentarily from your face, but you are offering him another target at which to aim. Although this does actually involve the possibility of his cutting your hand, it is much less dangerous to you than having your face or throat cut. Since you are only going to defend when your life is in danger, you have little to lose by making this defense, even at the risk of some injury.

The action must be very fast, but it is not a slight movement; rather, it is a daring, definite movement out and back. He should either react by looking at the movement or by trying to cut at it.

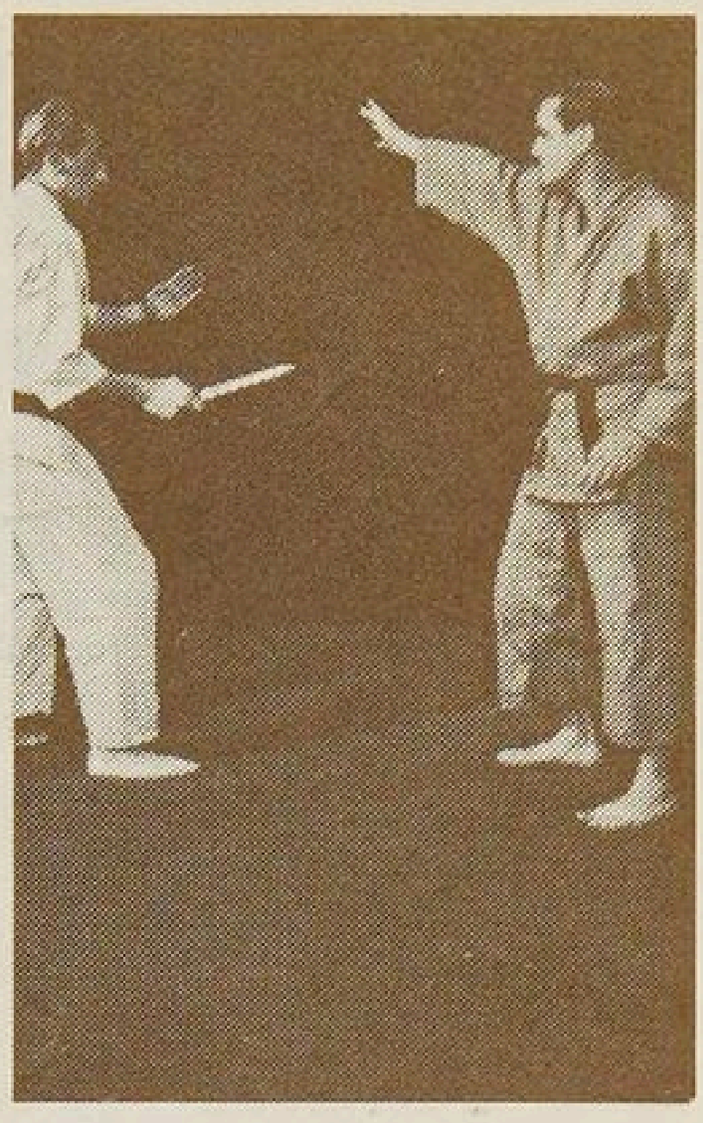
411



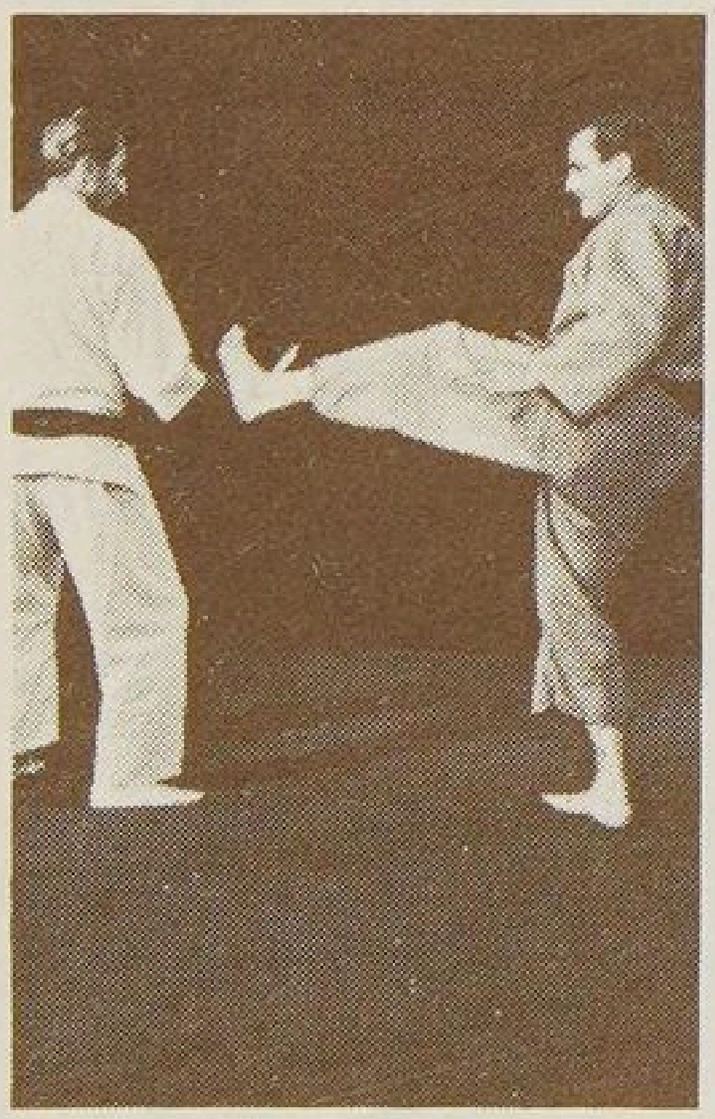
412



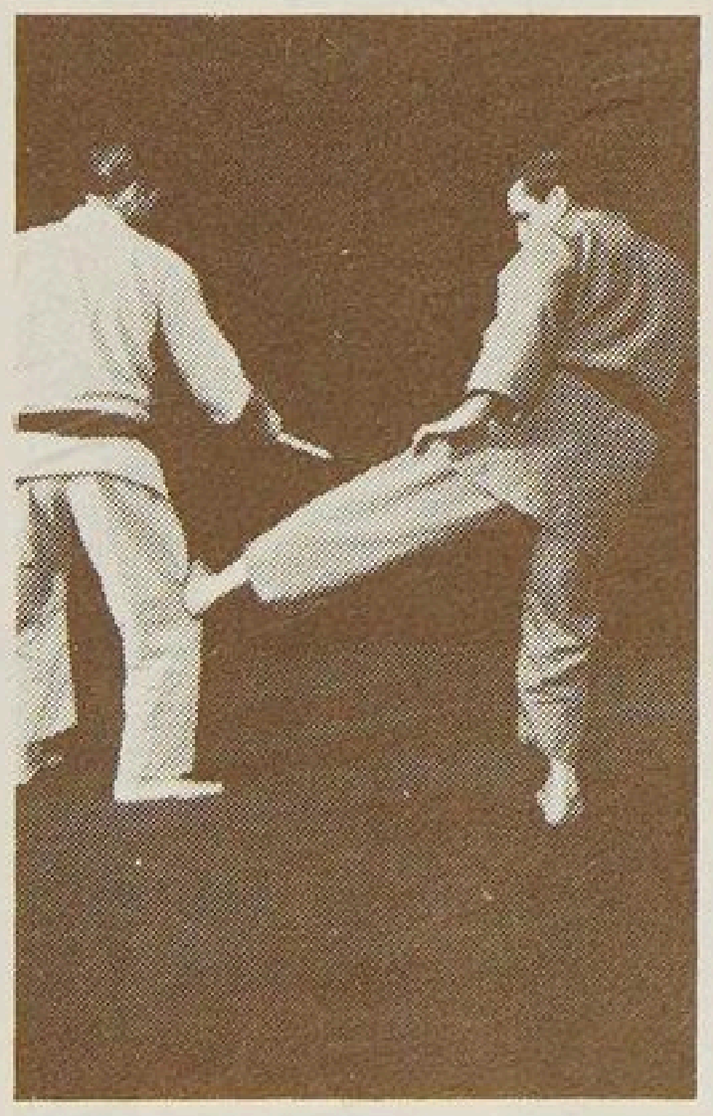
413



414

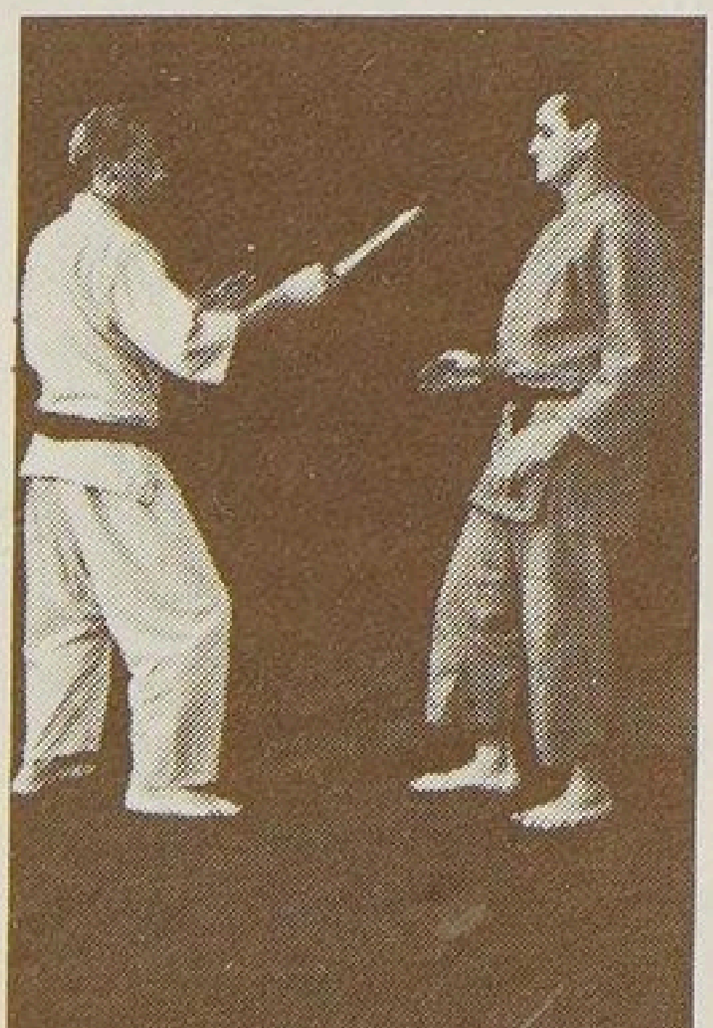


415

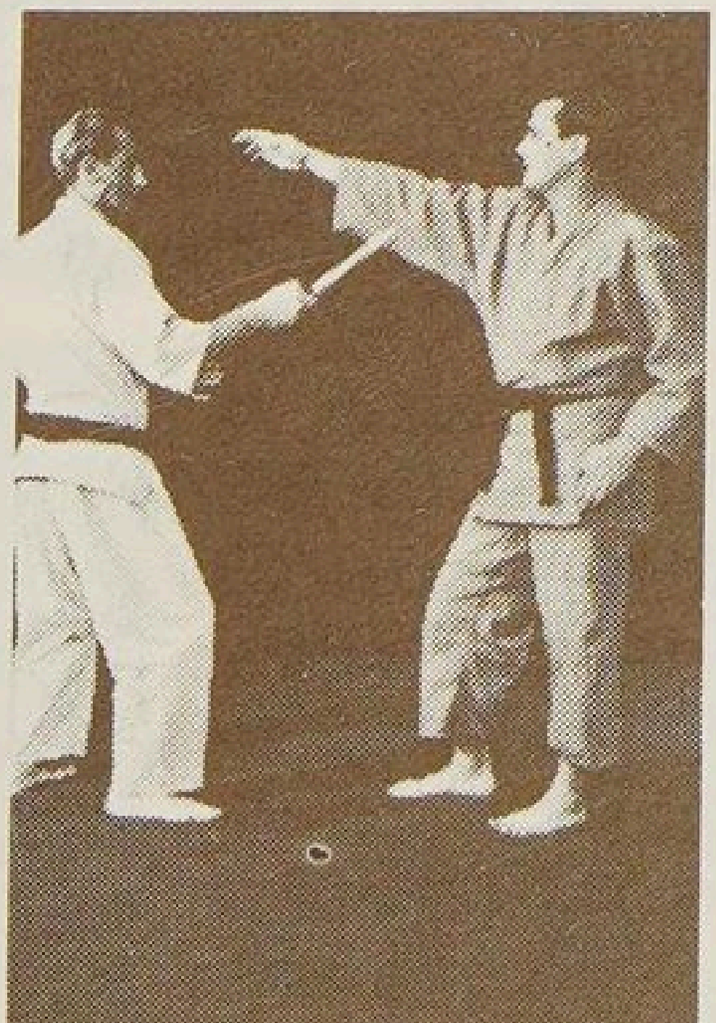


416

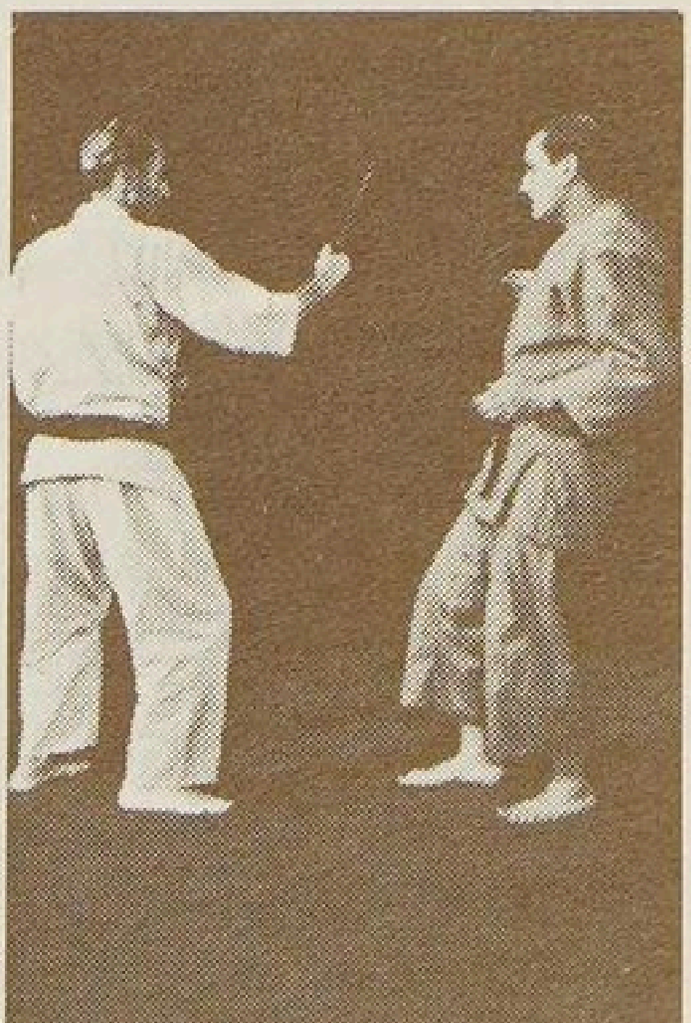
417



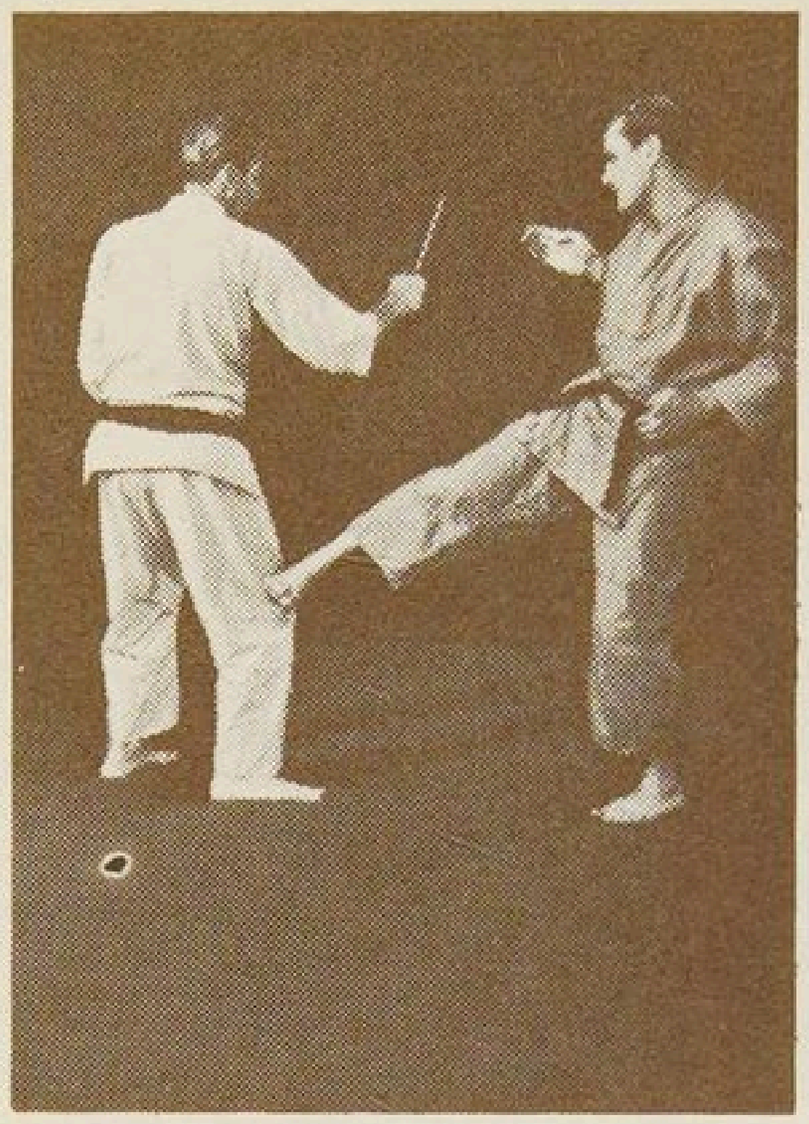
418



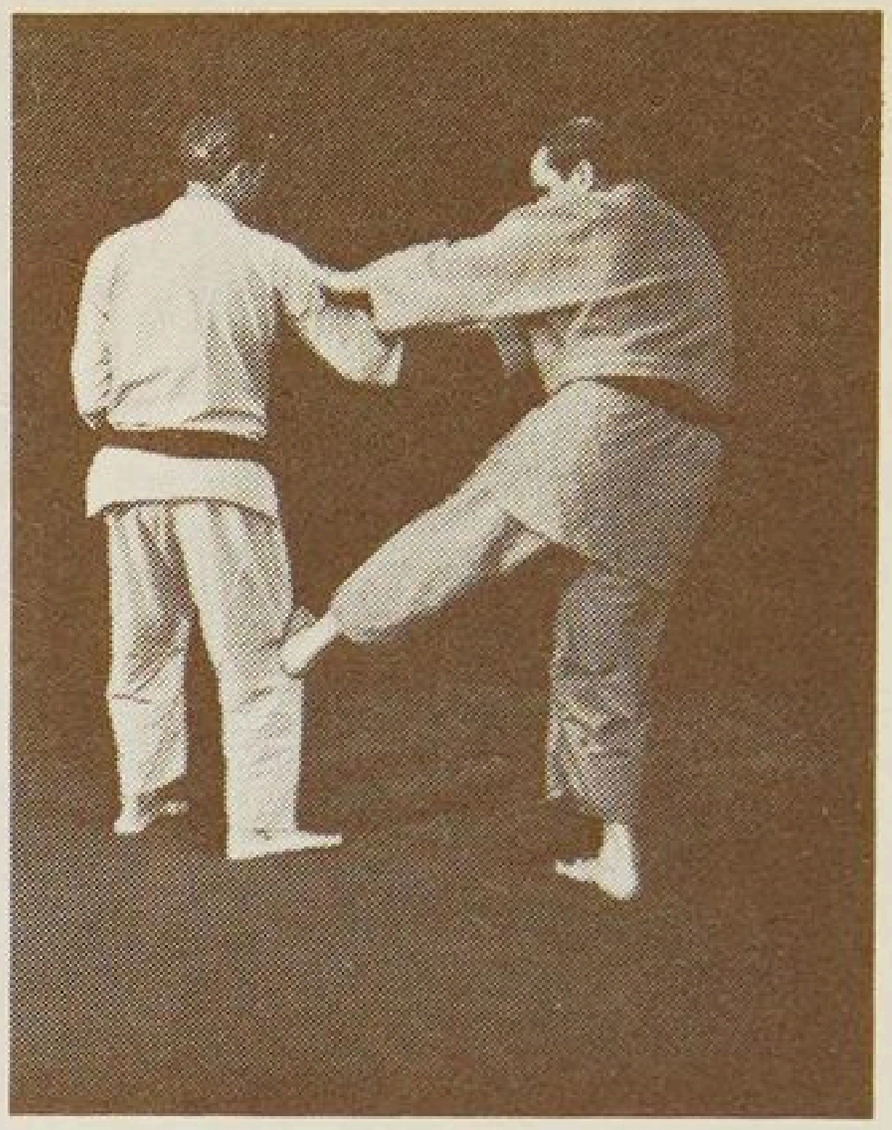
419



420



421



420, 421. Immediately kick into the knee with force and continue kicking until he is visibly hurt, capture his knife arm as soon as possible, locking it out away from you. Continue to kick until he is completely subdued or immobilized.

No takedown is required for the test.

Gang Attack Defense — Basic Technique

When two or more opponents threaten you on the street, you must absolutely be prepared to defend yourself. Unlike the situation where only one adversary threatens you, you do not have the choice of trying to avoid fighting. A gang is not likely to be talked out of, shamed out of, or reasoned out of fighting. If they were reasonable or compassionate people, they would not need to gang up with the odds in their favor; the very fact of being in this situation makes it necessary for you to act *first*. If you plead with them, they enjoy their sadistic pleasure more. If you wait to go into action, you will lose the very important advantage of surprise.

A gang does not expect a defense of any sort and they are disconcerted when their supposedly helpless victim comes in with yells, kicks, and a plan of action. The individuals in a gang are more cowardly than most (otherwise they would not need the false courage of ganging) and they are more unwilling to be hurt.

The technique taught in this section is basic to all the methods of defending against more than one adversary. It assumes, however, that you have some choice of moving about; later, you will be taught how to cope with a gang when you are cornered.

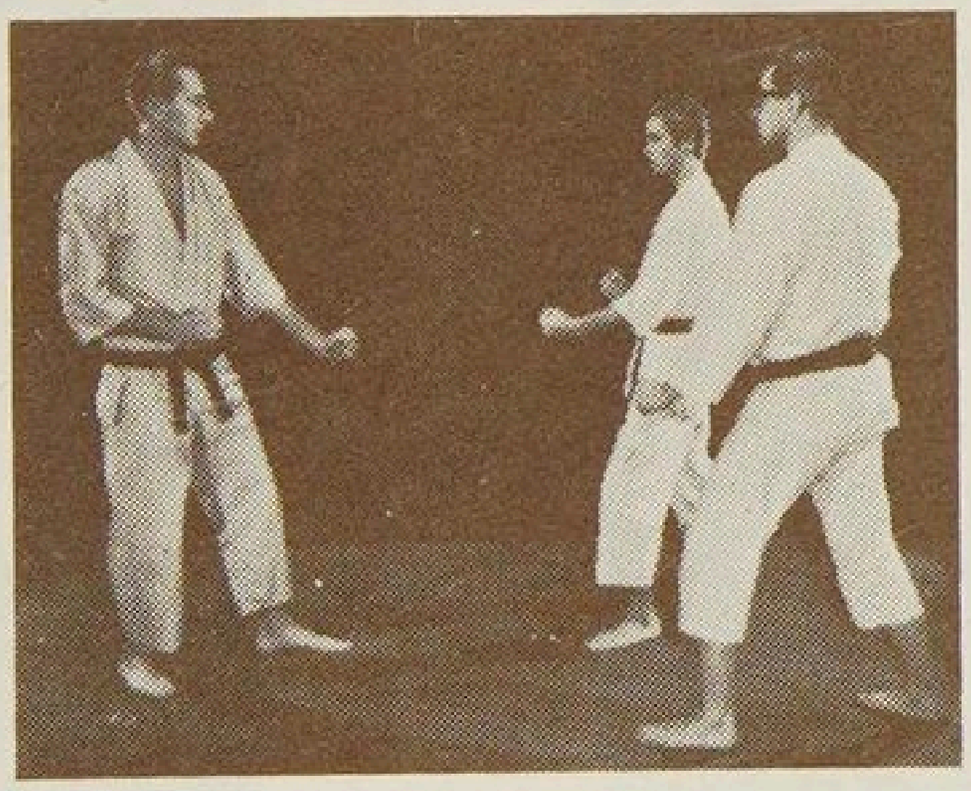
Because every single part of this defense is essential to its effectiveness, each detail has been pictured. Don't forget that a kick of only 60 pounds pressure is enough to dislocate a knee and you have some idea of what can happen if you kick with force.

422. Left man faces threat of attack from two opponents who are in front of him. The moment the threat of attack is made is the time to go into action. If possible, choose to hit the larger adversary or, if you can tell which one is the leader, hit him first. The psychological effect of taking on the leader or big man works to your advantage.

423, 424. Leap to the side of the larger opponent, or just leap to the side of one of the opponents if you do not have a choice. Immediately kick with force into the knee, delivering a second kick at him without hesitation.

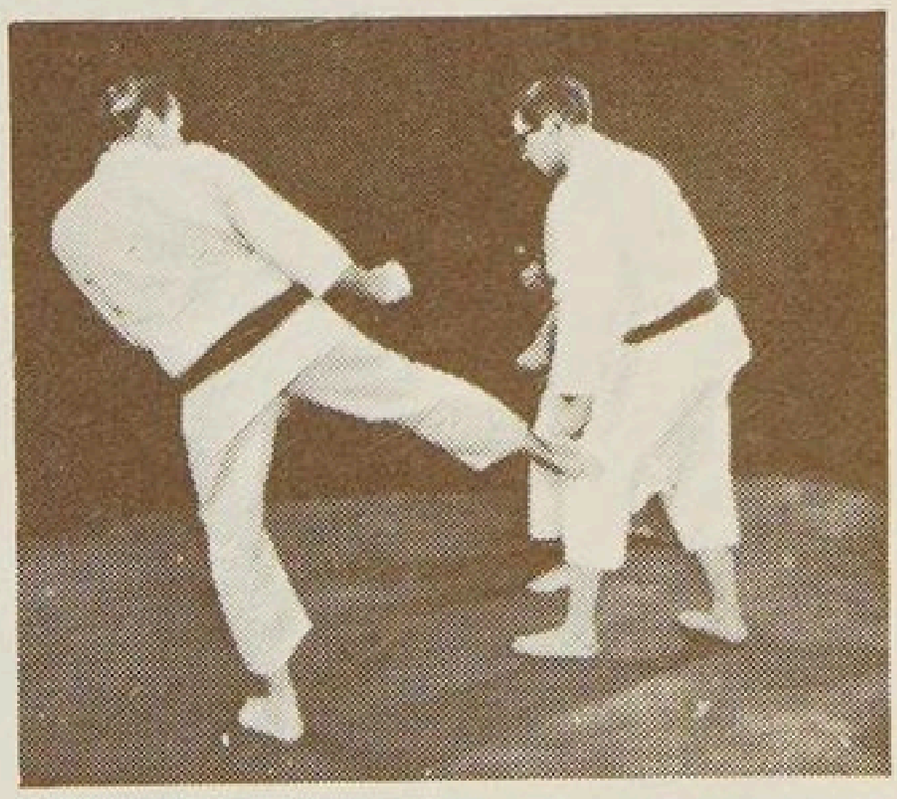
425, 426. Follow quickly with two hand blows to the head, neck or nose.

422



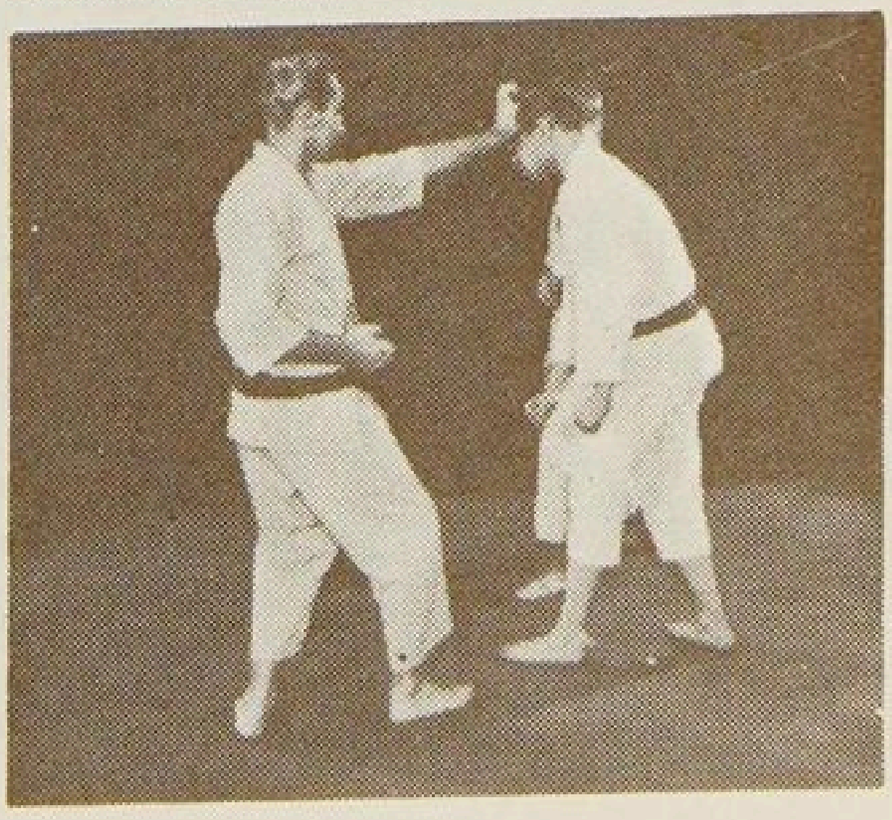
423

424



425

426



427. Get around behind him and use him as a shield against the other man; shove him into the second man.

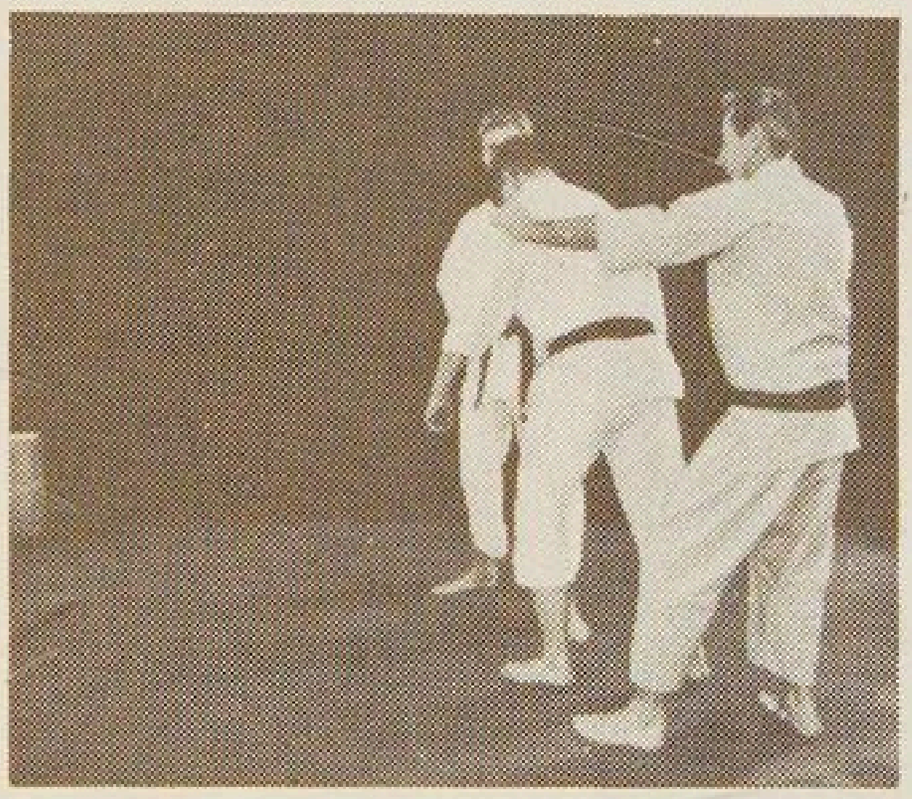
428, 429. It is quite possible that you need go no further in your defense, but you should learn the full routine in order to give yourself the best chance of success in such situations. Kick with force at the knee of the second man and follow with second kick.

430, 431. Strike into neck and nose of the second man.

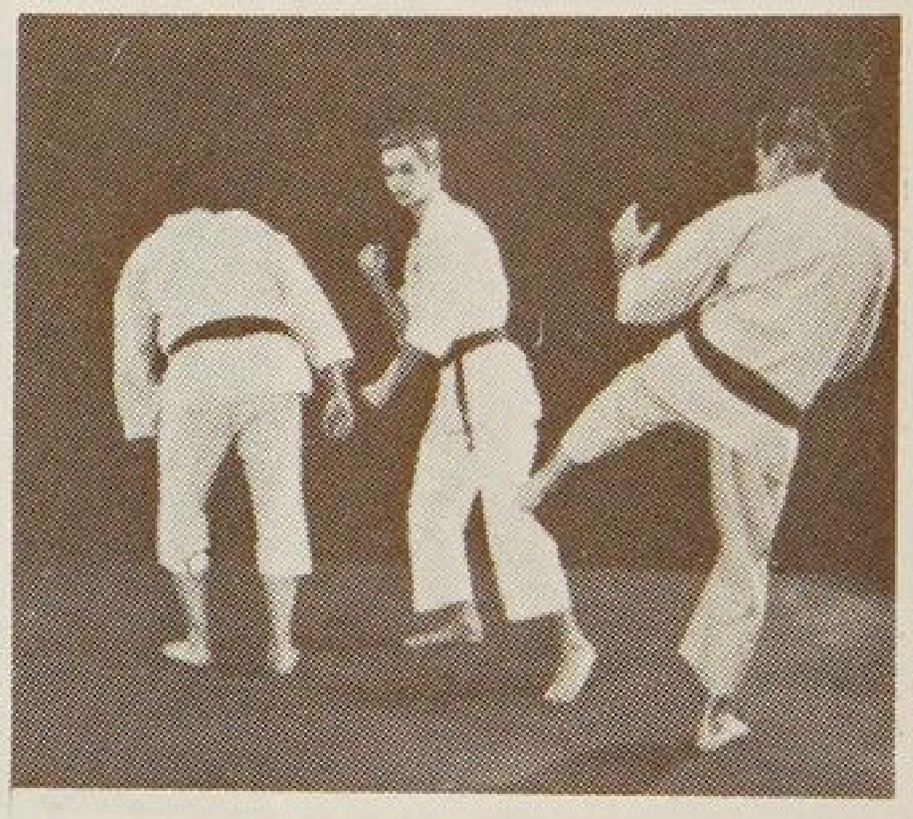
432. Shove the second man into the first man.

If possible, get away at this point, before they can recover, but be aware of the possible need to repeat the actions again.

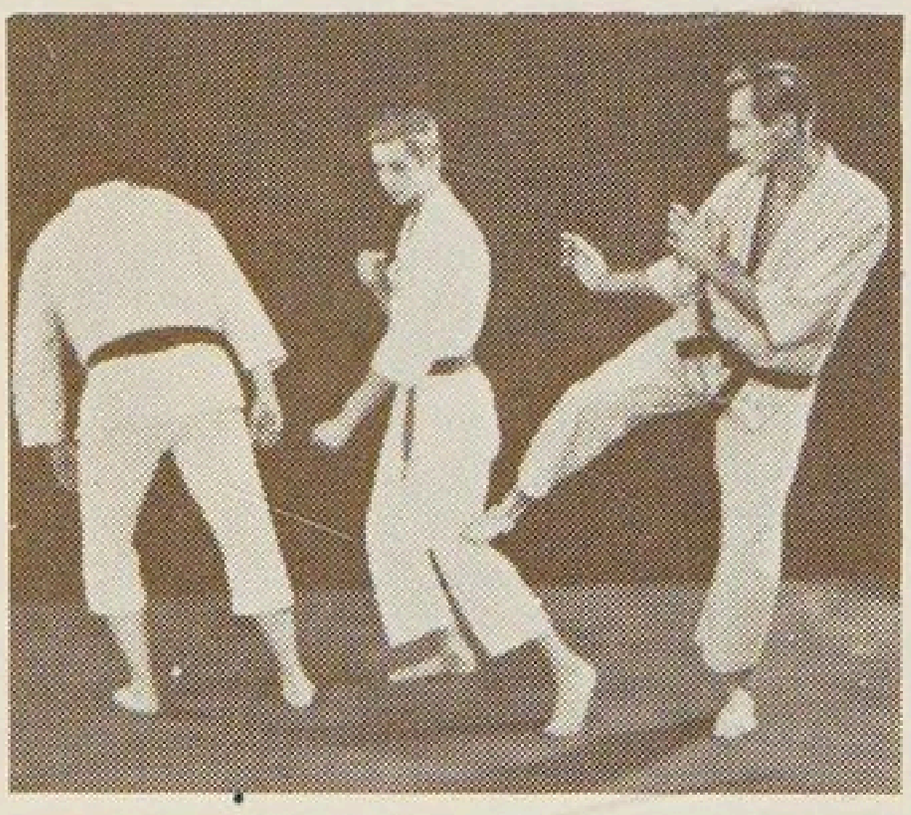
During the test, observe safety rules carefully; simulate blows and push your partners *toward,* not into, the other participants in the test; carry on until you have sufficiently demonstrated your ability to handle this type of situation.



427

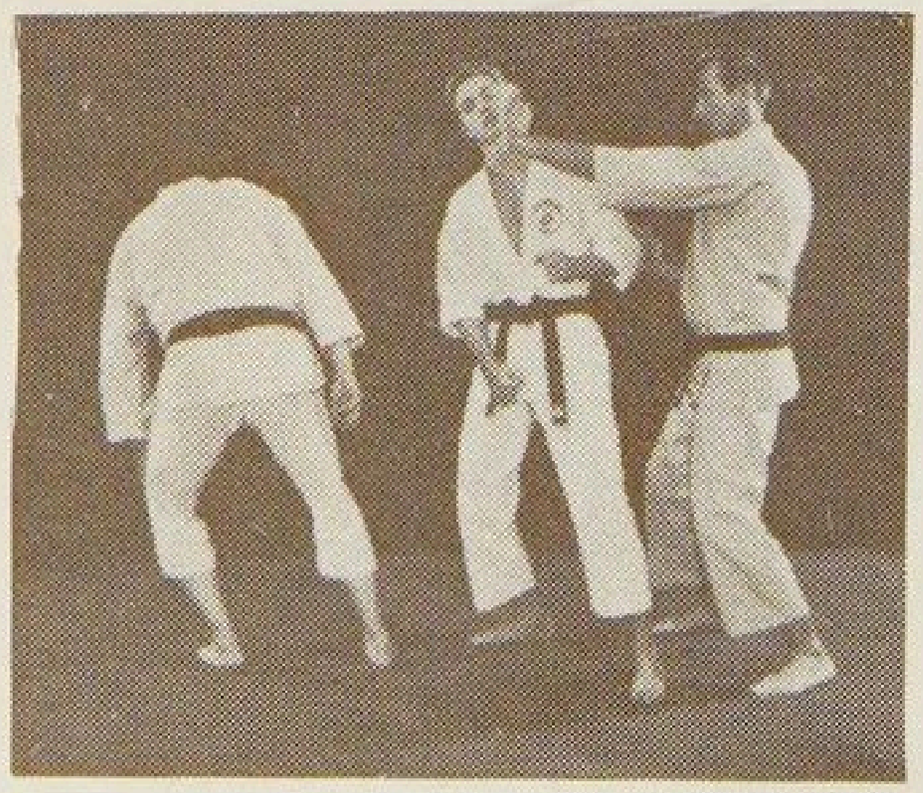


428

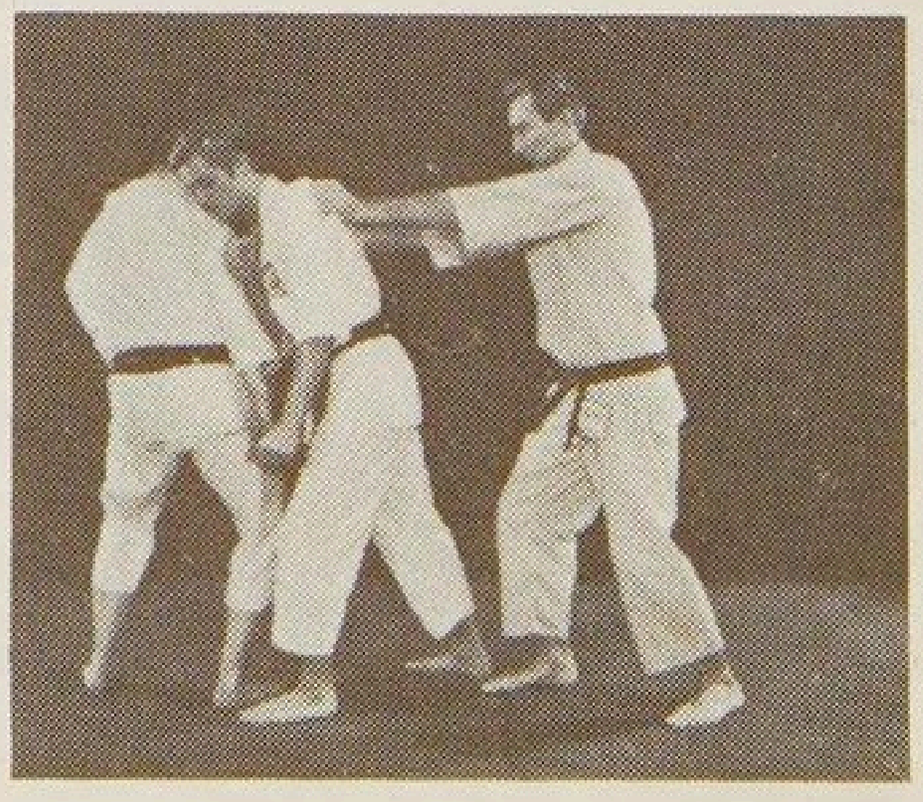


429

430



431



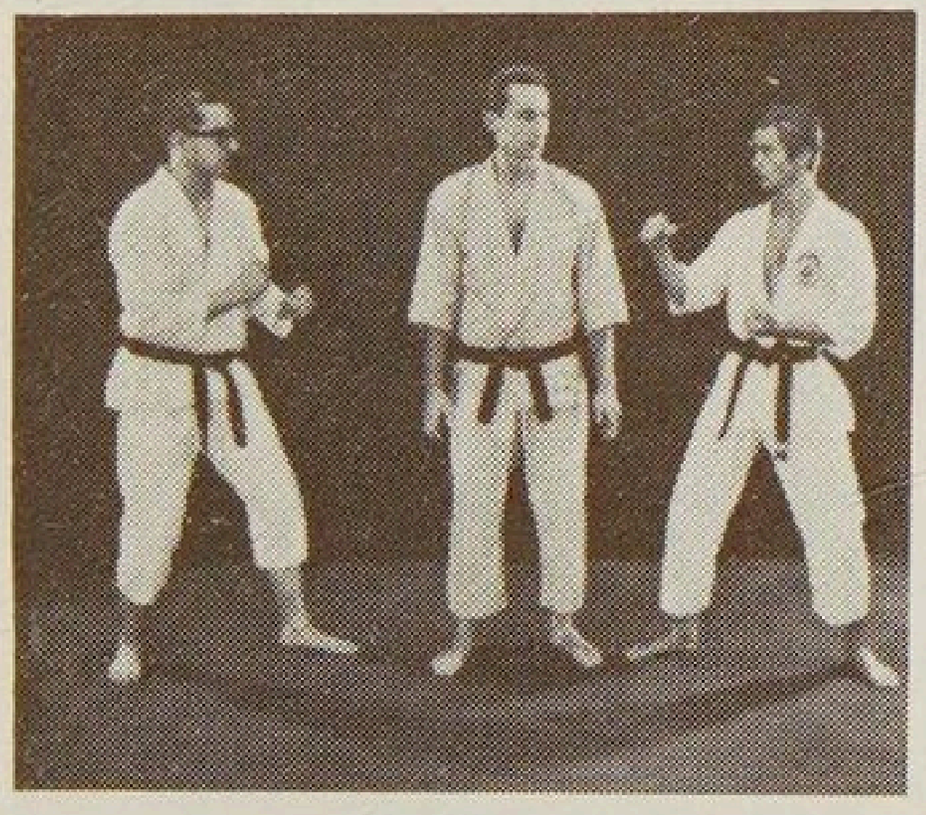
432

Gang Attack Defense — Assailants at Sides

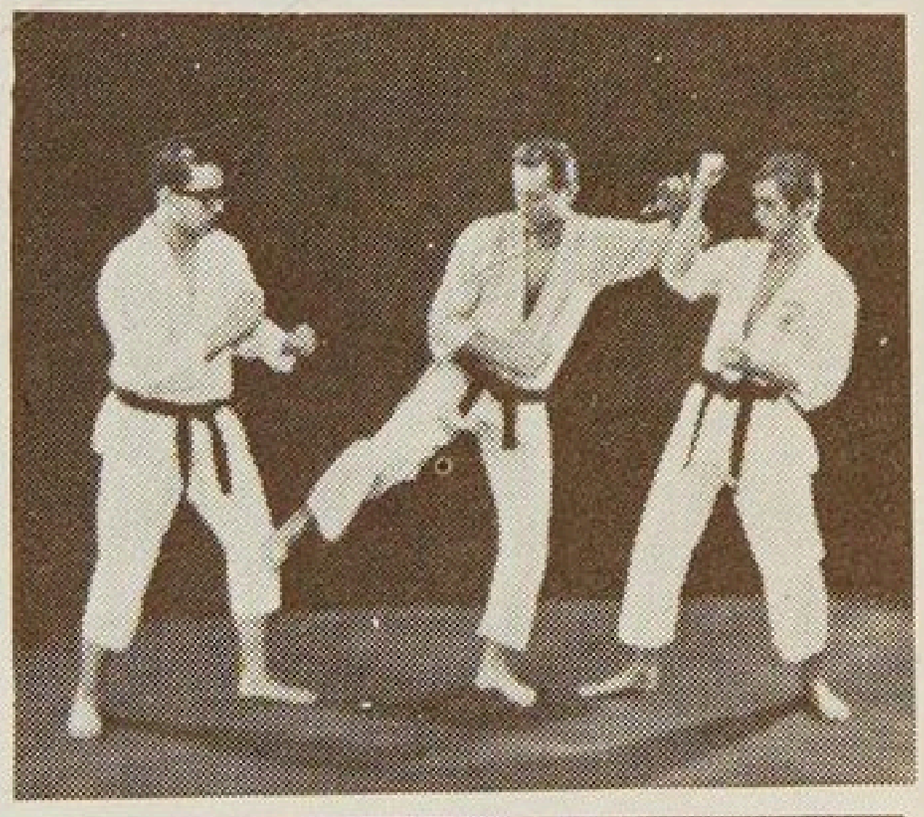
433. You are in the middle of two assailants who threaten you from each side and you cannot move from this position to start your defense.

434, 435. The time to go into action is the instant that they threaten attack. Using simultaneous hand and foot blows, kick into the knee of one assailant as you strike high at the second assailant. Immediately reverse the action, kicking the second man and delivering a hand blow high at the first man. Repeat this action until one of the men is obviously hurt. The hand blow is a blocking or distracting action; it is the kick which is the most efficient weapon of defense. For this reason, if you can determine which man is the leader, kick him first, or kick the larger of the two men first.

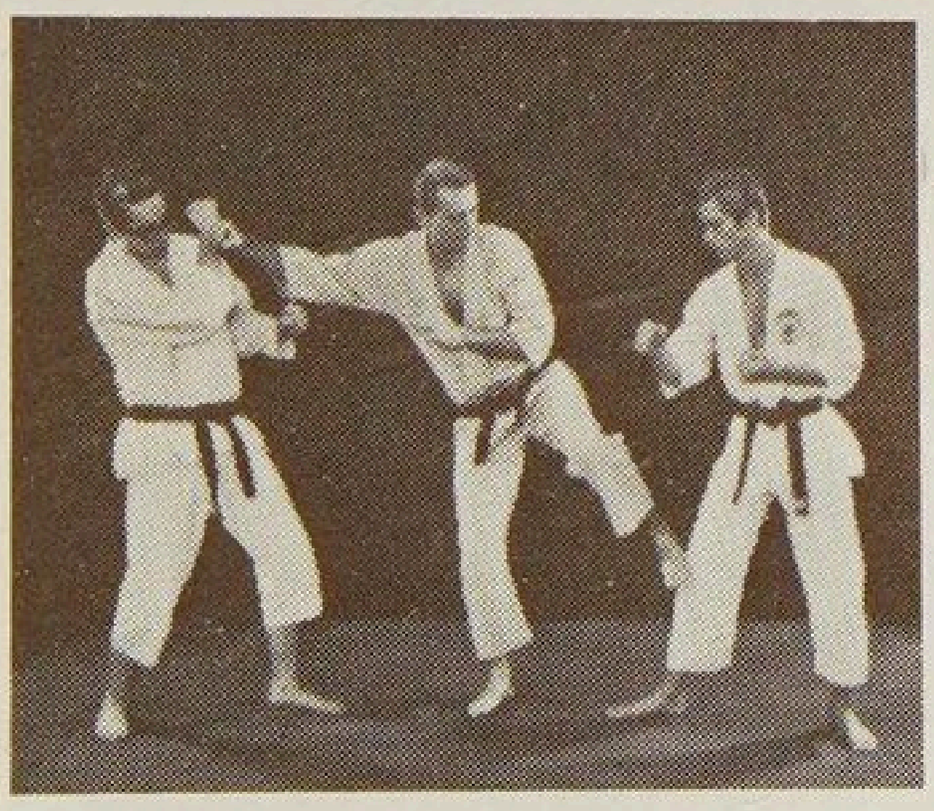
436, 437. When one of the men is hurt, get around behind him using him as a shield and shove him into the other man.



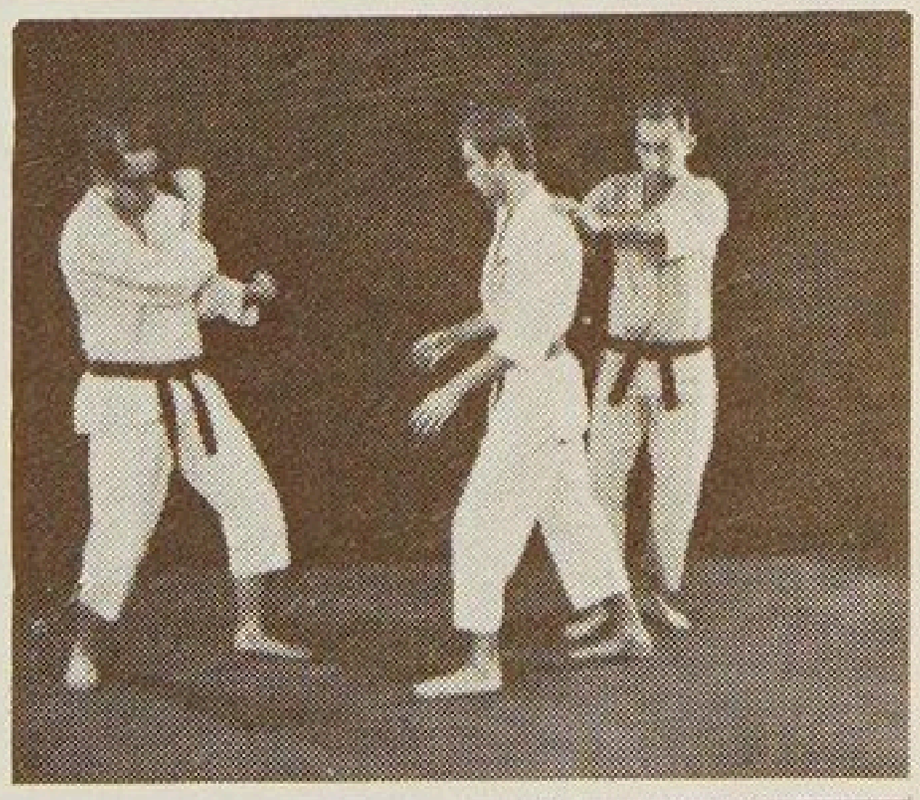
433



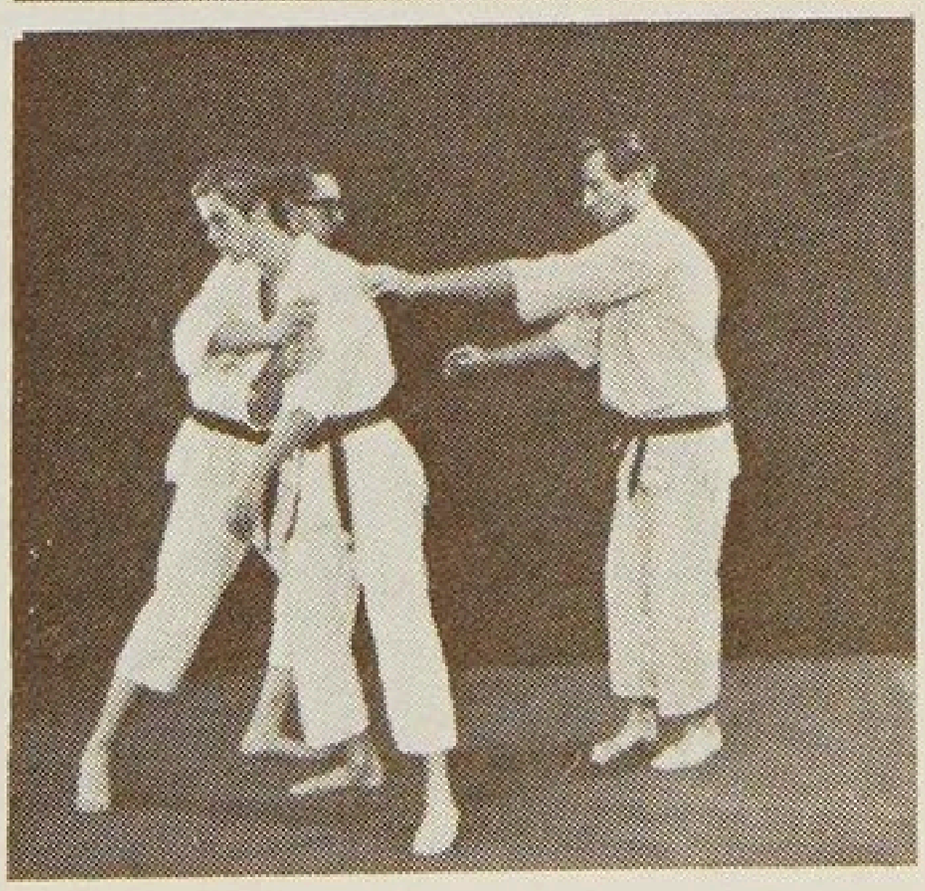
434



435

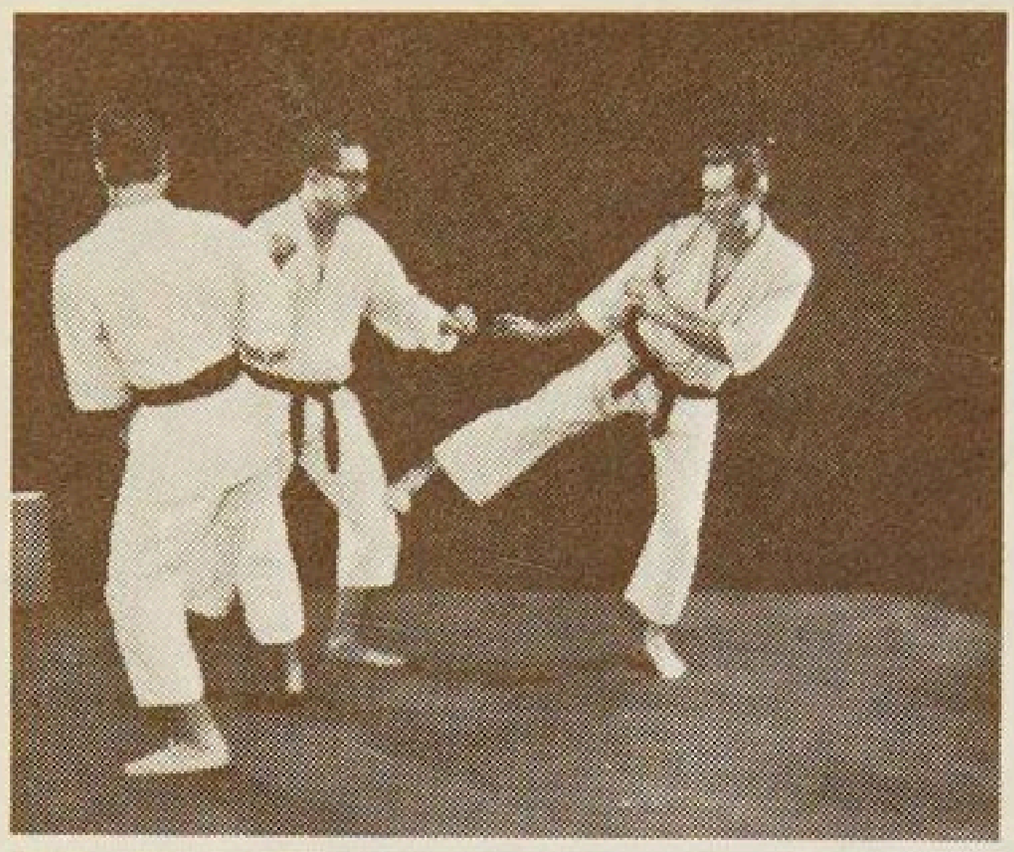


436

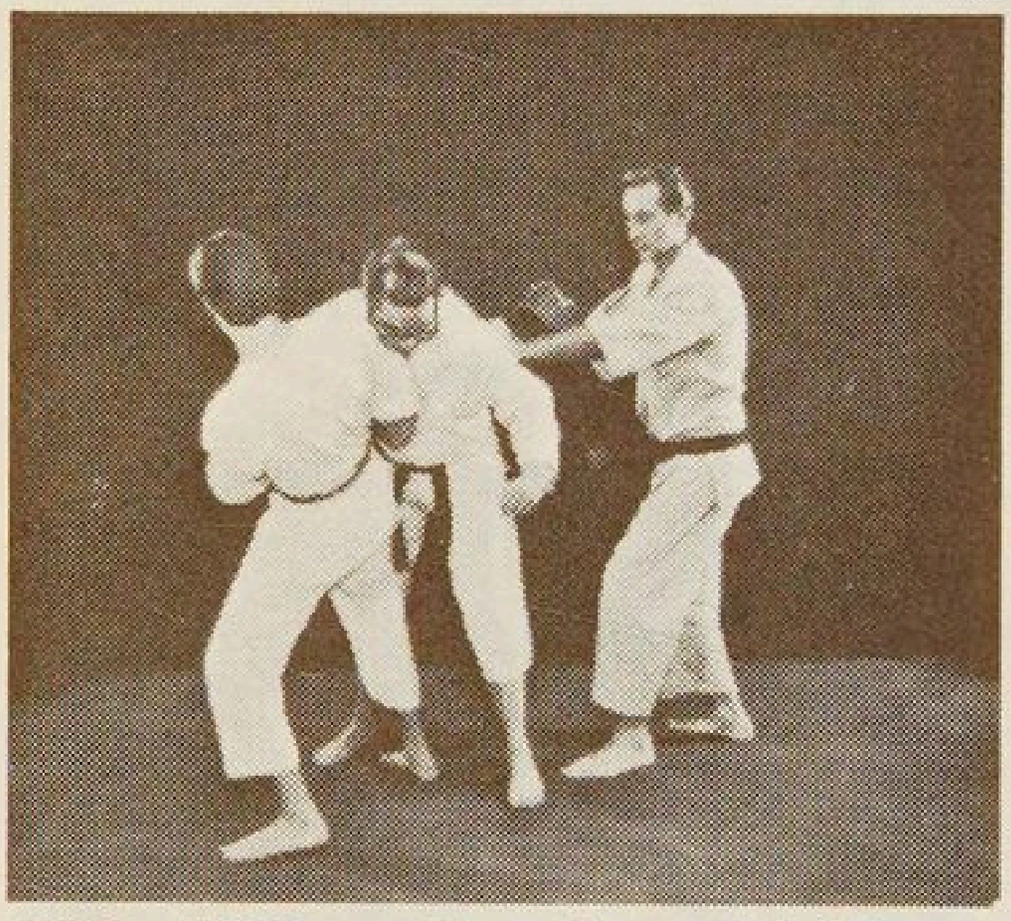


437

438



439



440

438, 439. Continue kicking at the next man.

440. Shove him into the first man. Continue this procedure until you can get away safely.

Gun Defense — Threat from Front, Amateur Style

Reread "An Armed Assailant: When to Defend."

441. Right partner simulates a style of gun threat which is not typical of a professional or experienced gunman.

442. Distract his attention with the appropriate subtle movement or tactic. (See "Distraction: For Use With Defenses Against Armed Attack.")

443. Using the instant when his attention is diverted, reach cross-body with your left hand and grip his hand and gun, locking your fingers over the hammer (stopping the action of the gun), pointing the muzzle away from you. As you grab his hand and the gun, pushing it away from you, shift your body back so that you are out of range.

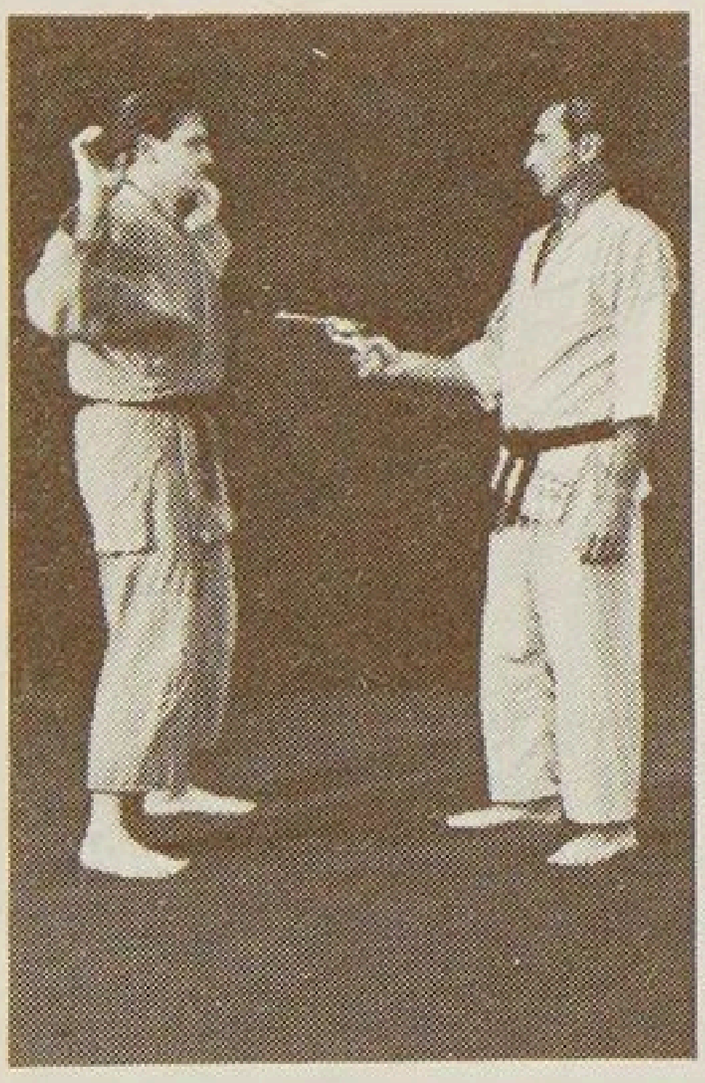
444. Without hesitation, stab into his eyes or windpipe with your free hand.

445. Grip the gun hand from below with your right hand and keep your arms rigid as you deliver forceful kicks into his knee.

446. When he is obviously hurt, apply under arm lock and take the gun away from him.

For the test, partner attacking will use a *toy* gun. You will demonstrate disarming the assailant and then step back into ready stance.

441



442

443

444

445

446

Gun Defense — Hip Style Threat — Wrist Lock Ending

447. Left man threatens attack in style typical of experienced gunman.

448. Distract with right hand.

449. Using the instant of diversion, reach with your left hand, grabbing his gun hand and gun, locking your fingers over the hammer and twisting the gun away from you. As you grip, back out so that you offer less of a target.

450. Maintaining your grip on him, kick into the knee as you stab into eyes or throat with your free hand.

451. When he is visibly hurt, apply first wrist hold; take the gun away from him and put him on the ground.

CREATIVE ADAPTATION FOR RANK TEST

In order to encourage creative uses of all techniques, students are required, for this rank and further advancement, to invent formal demonstrations which show ability to adapt material to individual style. Although the work is prearranged and rehearsed for the test, it is not an imitation of combinations which have been used before, but original patterns devised by the student. Five examples are required for this degree. Each example follows a sequence of: 1. Stopping the attack; 2. Applying a lock or hold; 3. Takedown or throw; 4. Application of hold or lock on the ground.

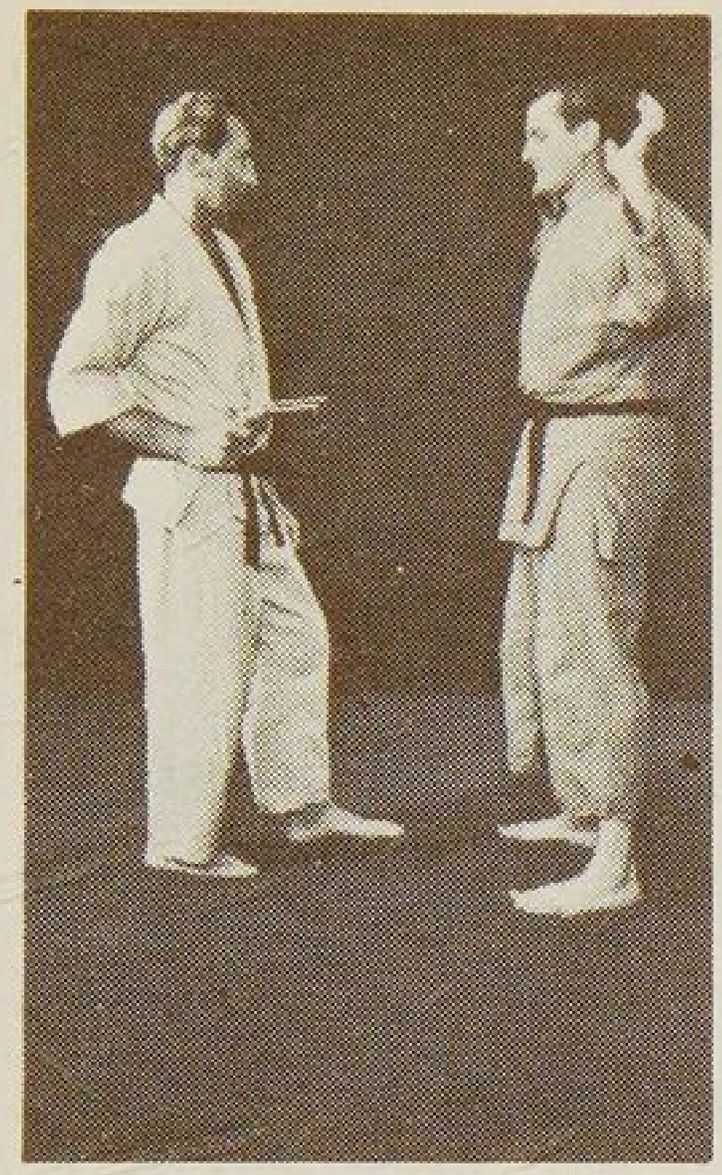
The sample creative work shown here for your guidance was developed by Barney Tiernan and was demonstrated by him during his test for advancement to this rank.

452. Barney Tiernan, shown left, responds to threat of fist attack using forearm block.

453. Second action is an elbow blow.

454, 455. Third step is the application of straight up arm lock .

447



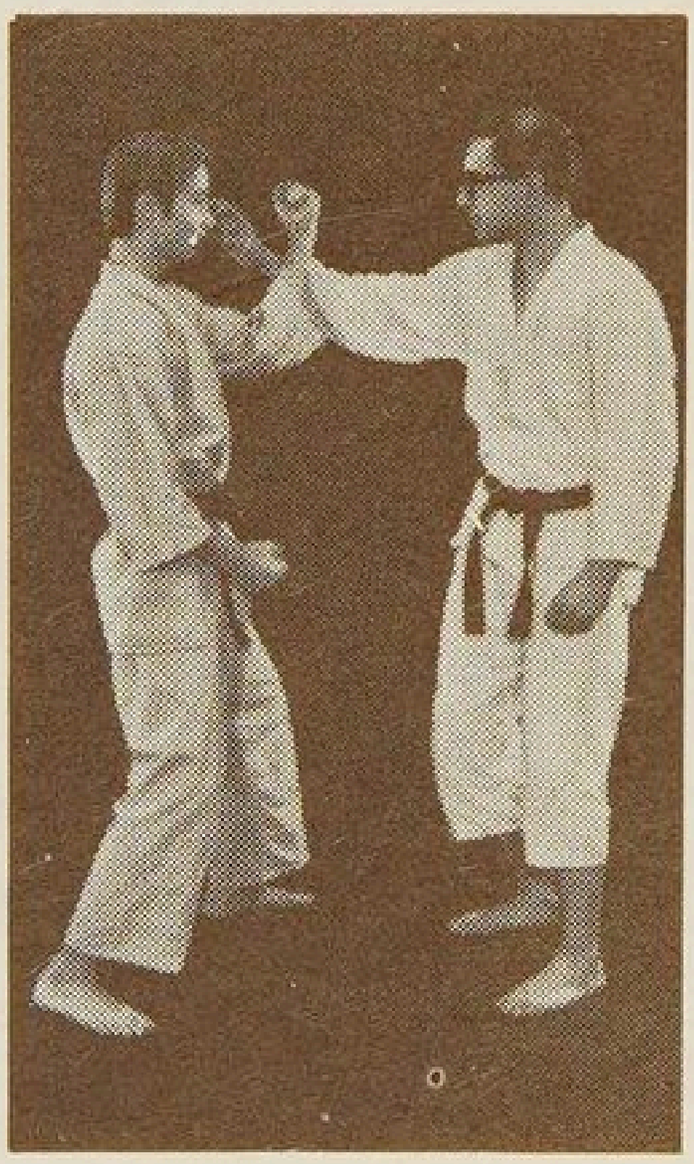
448

449

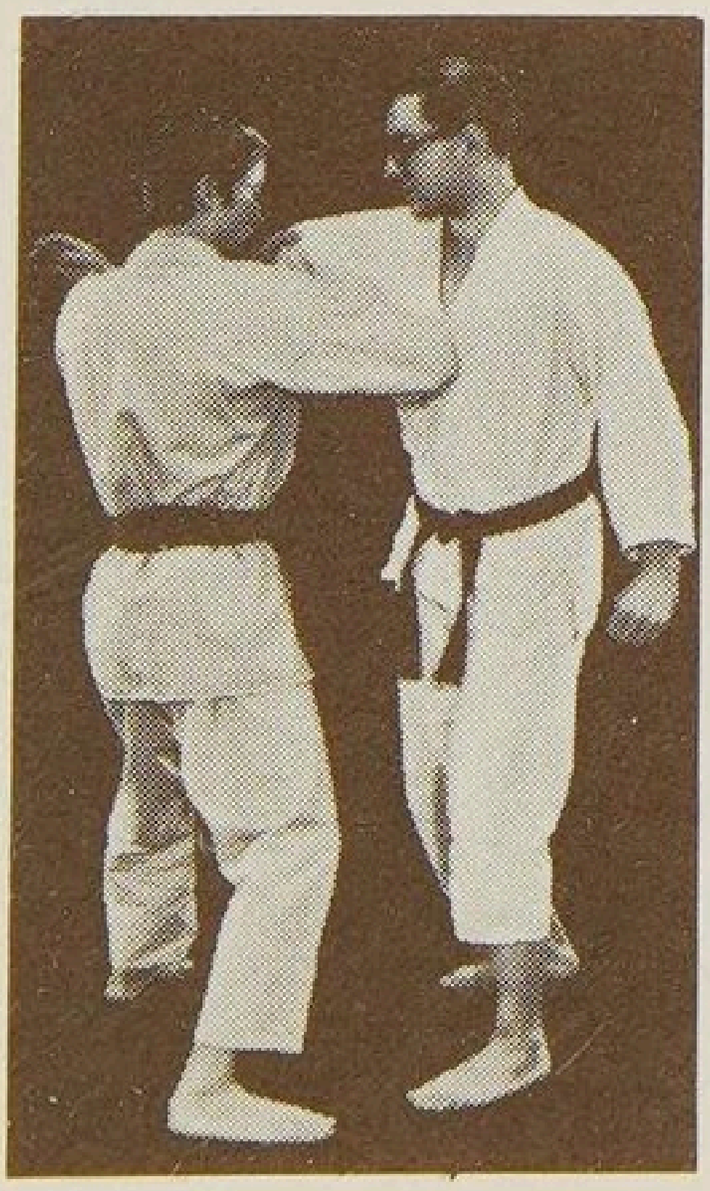
450

451

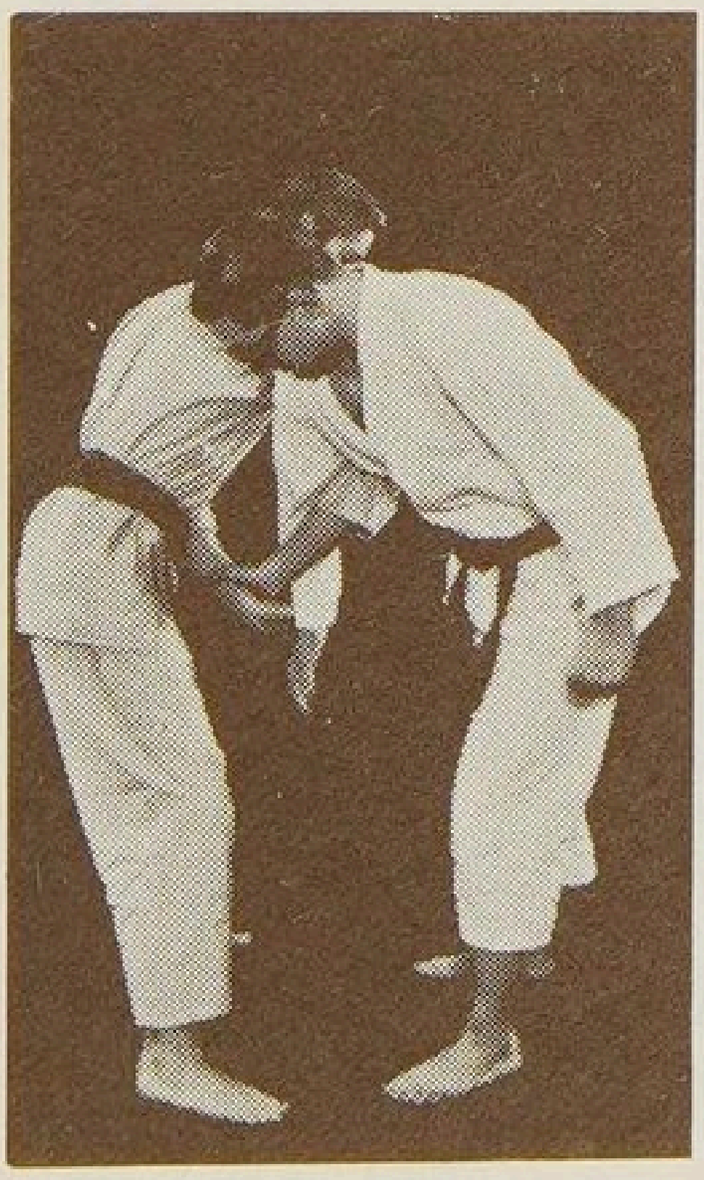
452



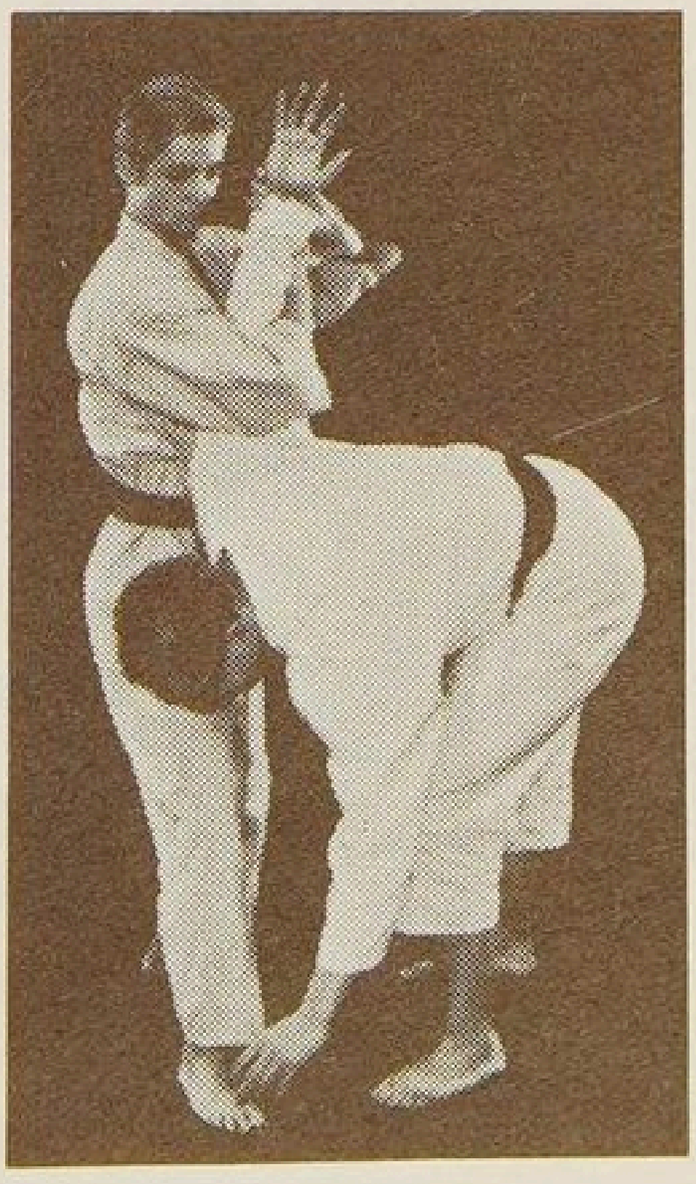
453



454



455



456, 457. He then applies left side straight foot throw, at the finish of which he has applied a variation of an under-arm lock.

FREE-STYLE SPARRING:
(With Hooking, Sweeping, Grabbing)

For this test, the sparring must be of a higher technical excellence. In addition to hand and foot blows used in previous sparring, there is the use of tripping hooks and sweeps. Only students who can fall safely are permitted to engage in this type of sparring. Proper surface is somewhat protected (a rug or mat is best). (See section on "Mat Substitutes.")

As usual, students are graded on ability to attack and defend, to counter-attack, the ability to respond quickly and appropriately, ability to deliver varied blows with speed and precision.

Hooking

Hooking is efficiently applied when you have maneuvered your opponent into shifting his weight back, making him vulnerable to this technique.

458. For example, you might feint with a high hand blow toward his head.

459. His response is to block upward, shifting his weight back. As he leans back, hook your instep behind his ankle.

460. With a snappy action, draw your leg up and forward to take him completely off balance.

Sweeping

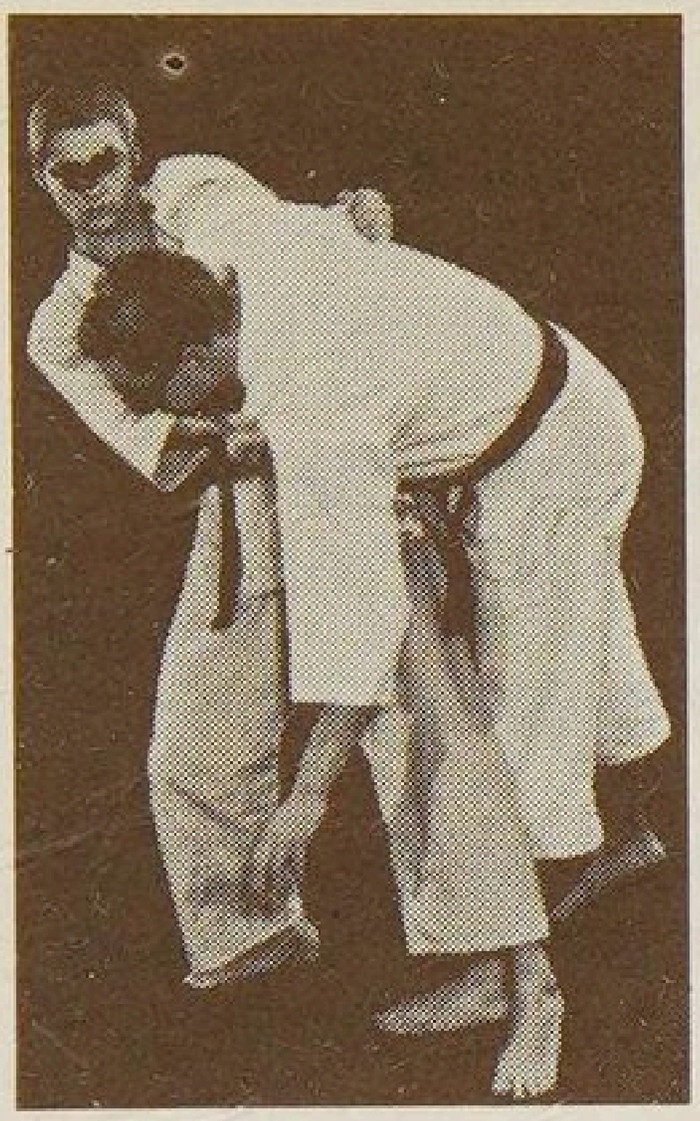
Sweeping is similar in action and intent. The choice of hooking or sweeping is a matter of personal style. Some students find it more comfortable to hook, others prefer the sweeping action.

461, 462. Feint to get a response which makes your opponent, shown left, move his body back; grab his arm and keep him in this off-balance position.

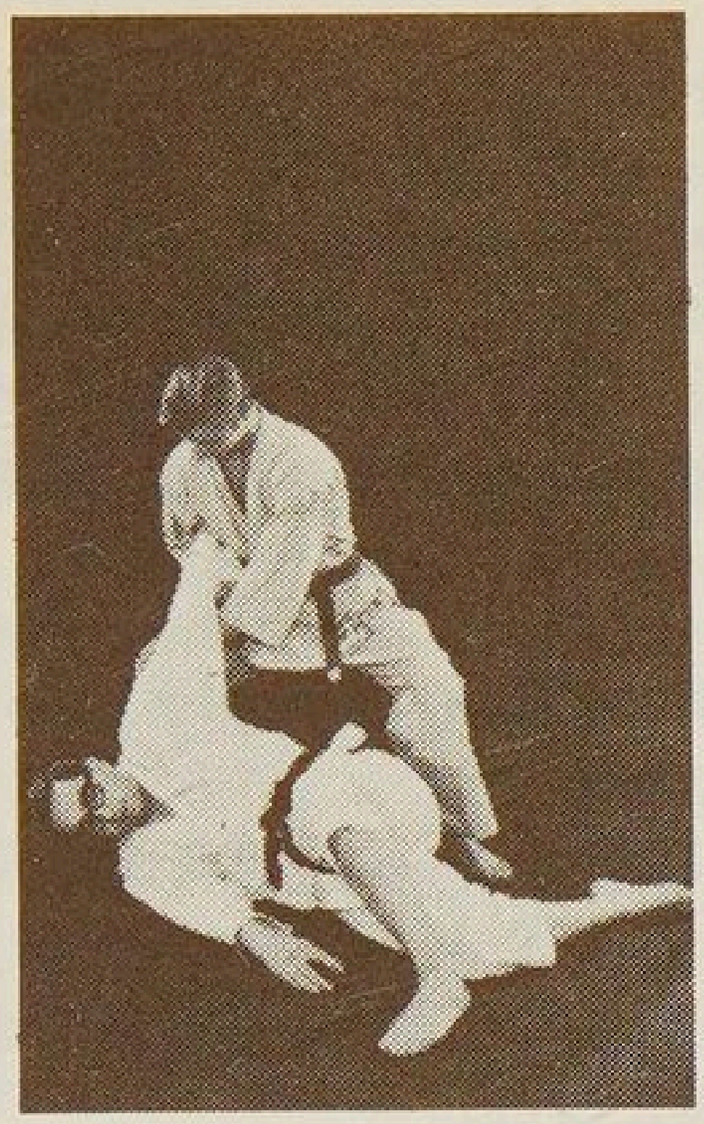
463. With the bottom of your foot, sweep the side of his ankle.

464. Carry through with a high swinging action of your leg; when he is off balance, pull him around in the direction of no support. (This last action has moved your sweeping foot around to the back of his foot; the sweep is begun with your foot at the side of his foot.)

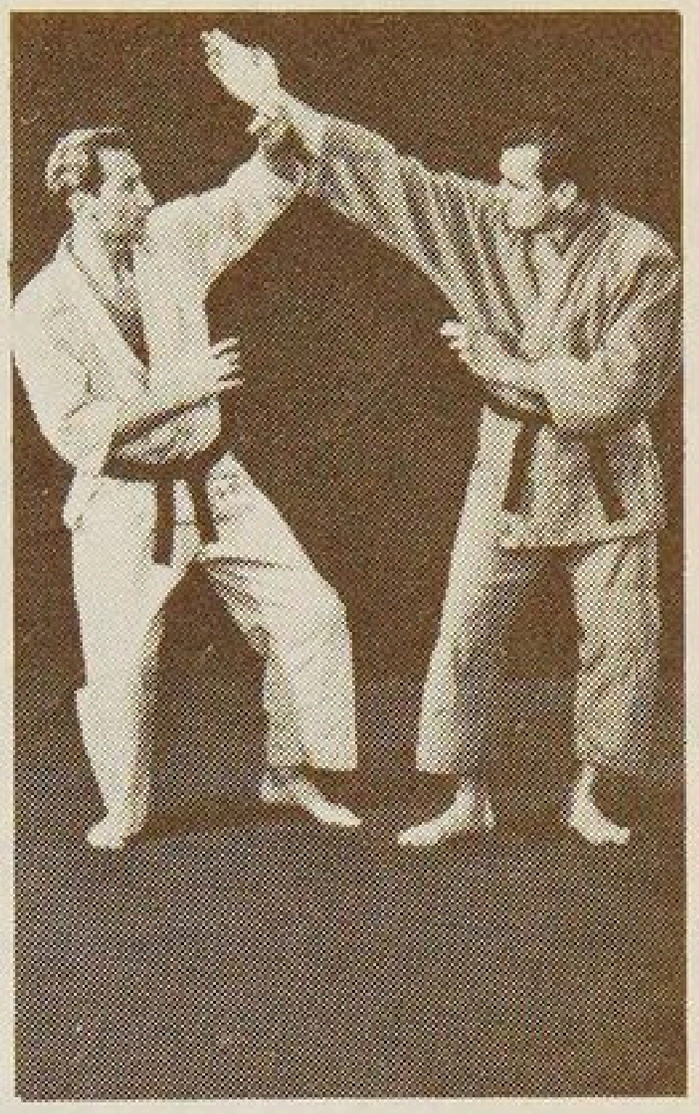
456



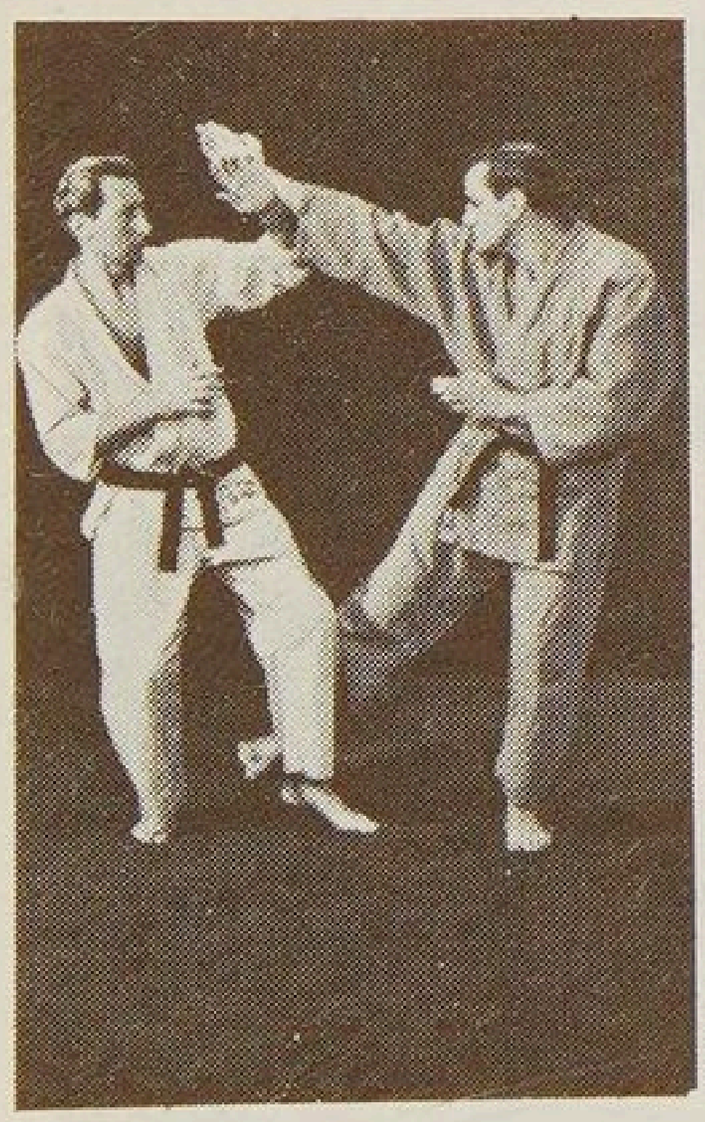
457



458

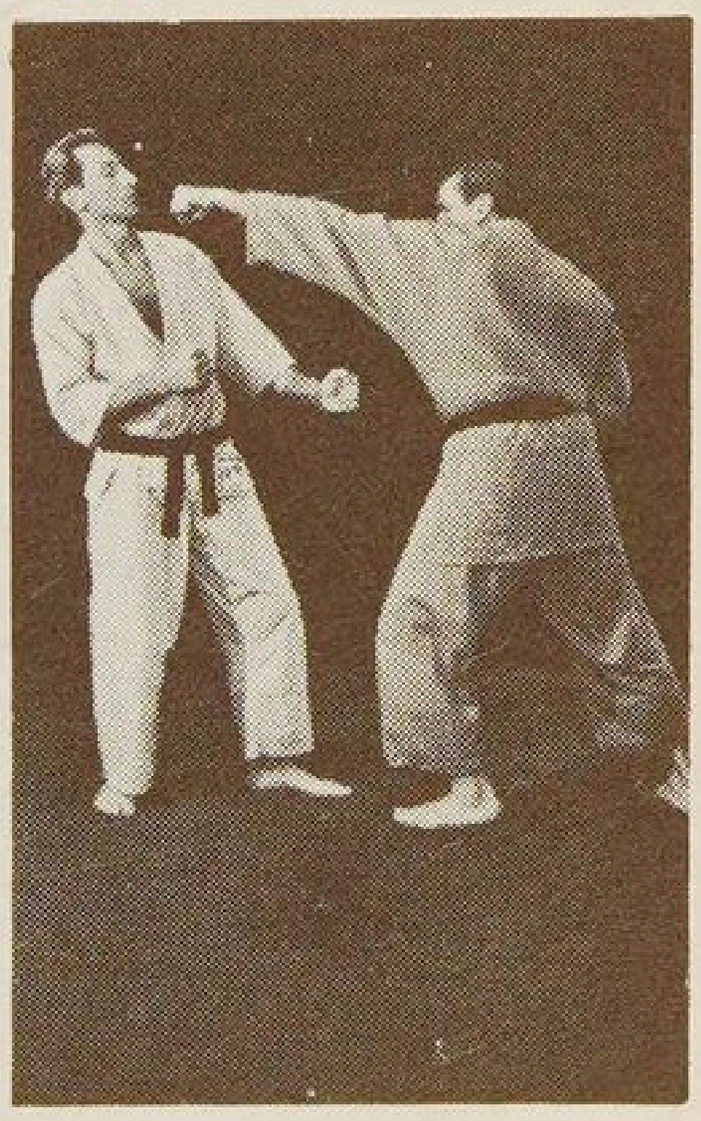


459



460

461



462

463

464

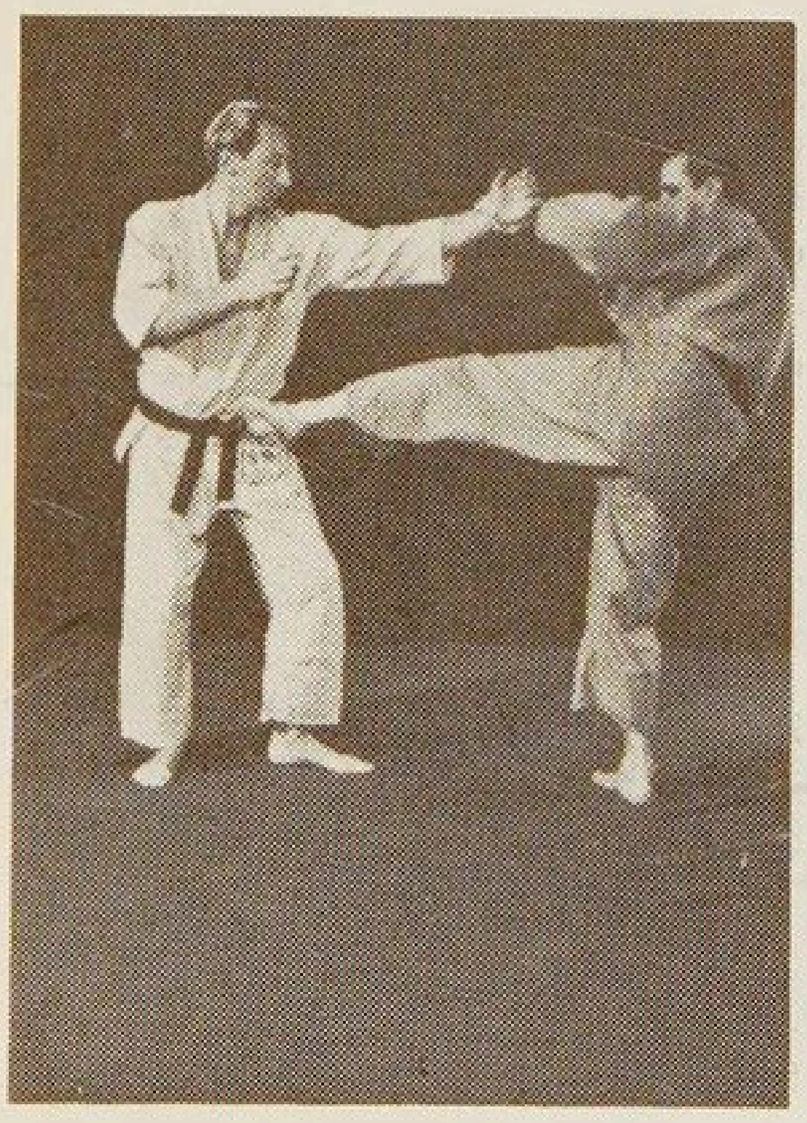
Grabbing

Grabbing is primarily useful to assist in creating an opening for hand and foot blows against a strong defense. The grab functions in several ways; It is diverting and acts as a feint. It immobilizes the grabbed arm, making his defense difficult. It can be used to put him into awkward balance and vulnerable to your attack.

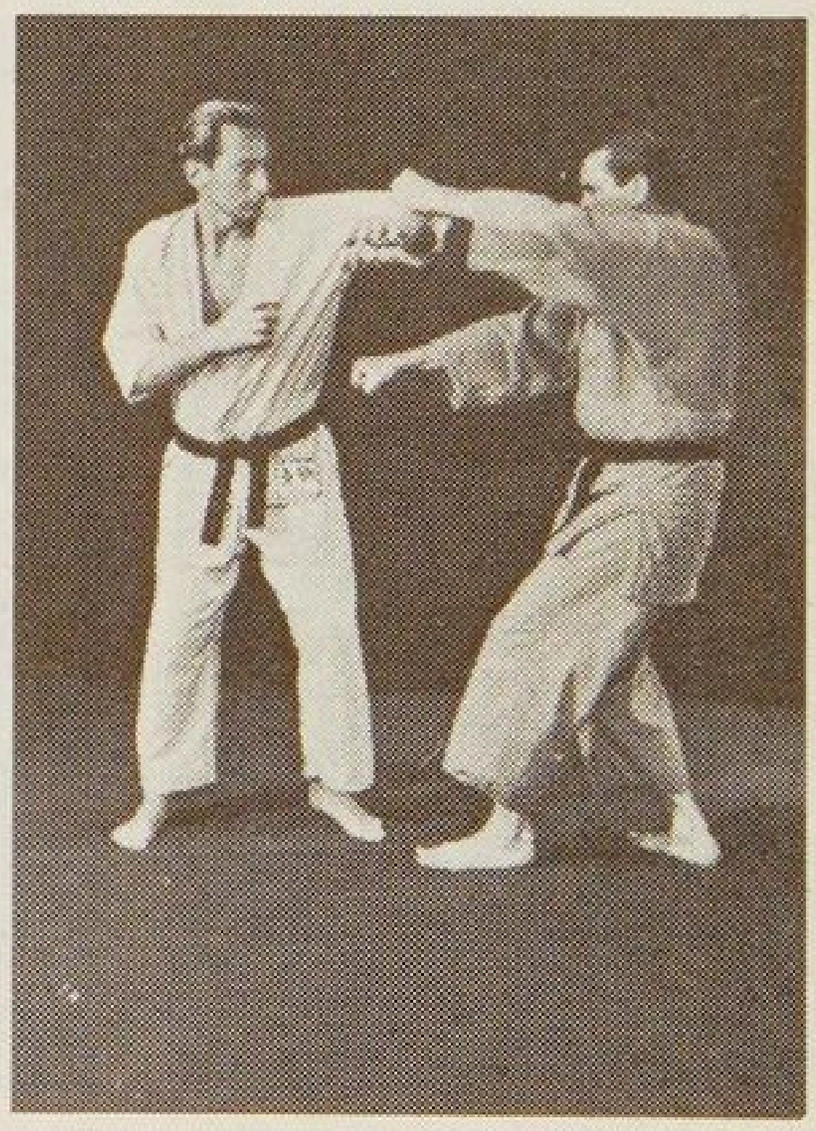
465. When his forward arm presents itself, as in a reaching guard, you can grab his wrist and apply a middle-area kick.

466. Grabbing cloth gives somewhat more holding power and allows easier maneuvering of your opponent. Here you grab cloth at the upper arm (or elbow) and jerk him around as you deliver hand blows to rear middle body.

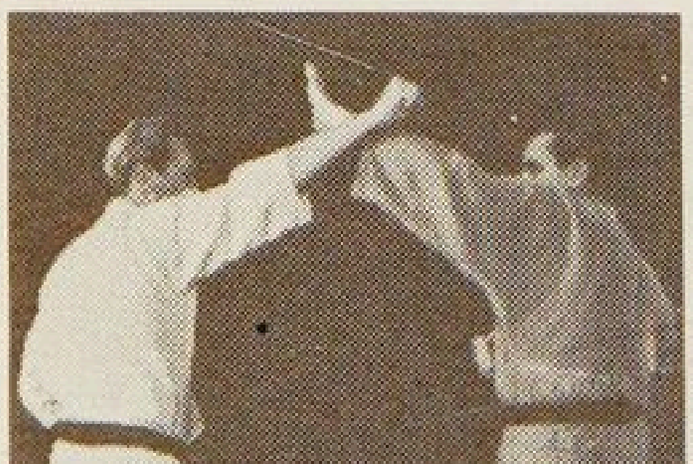
465



466



467



468

469

Block and Grab

467, 468, 469. Grabbing can also be used in counter-attack situations where your opponent has attacked and you have blocked. Quickly grabbing the blocked arm, you can pull him off balance as you apply counter-attacking blows.

DEMONSTRATION OF RESPONSE TO UNREHEARSED ATTACK SITUATIONS

This is the first time the student has been asked to react to attacks which have not been practiced. The instructions are given to the opponent after the test has started. The person taking the test does not know who his opponent will be for this portion of the test. The instructor (or person giving the test) selects the type of attack and indicates how it shall be made. There should be five separate encounters and the student is expected to react with quick and appropriate responses. All safety rules are to be observed.

HOW TO TAKE THE TEST: BROWN RANK (Two Stripes)

This test must be given and graded by a person holding the rank of black belt.

Again, in this test for advancement, the student must show an increased ability in technique, more body control, greater precision and he must respond appropriately to the unrehearsed situations with considerable speed.

While carefully observing the rules of safety, the test is conducted with a more realistic style in the attacks and more ingenuity in defense procedures.

A takedown finish is demonstrated with all the applications of holds and locks.

Throws must be crisp and clear-cut; they should give the appearance of effortlessness.

BROWN RANK — SENIOR DEGREE (Three Stripes)

Holds and Locks (for Formal Demonstration)

- Bent Arm Lever Lock
- Elbow and Wrist Lock
- Bent Arm Lever With Pivot
- Under Arm Pin
- Choke With Arm Lever

Uses of Holds and Locks: Showing Attack, Defense, and Takedown
Throws
Leg Lifting Throw
Knee Block Throw
Back Straight Foot Throw
Defenses Against Attacks

Demonstration of Response to Unrehearsed Attack
How to Take the Test for Brown Rank (Three Stripes)

HOLDS AND LOCKS (for Formal Demonstration)

- **Bent Arm Lever Lock**

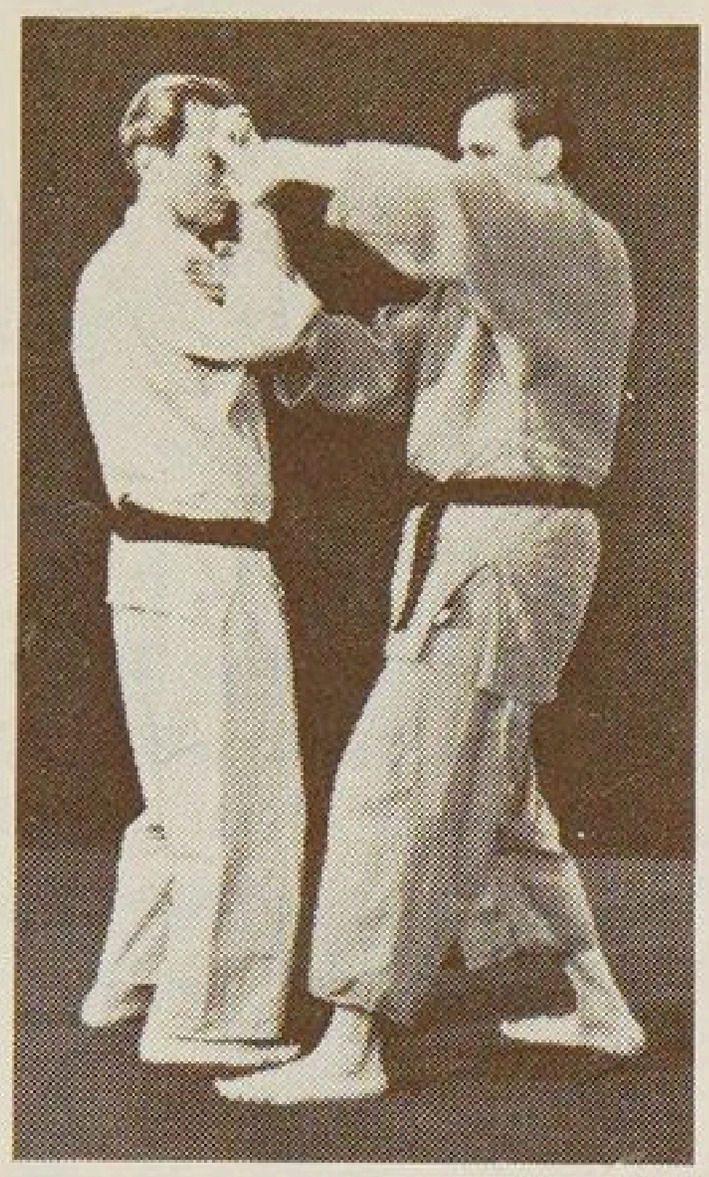
470. Left partner offers no resistance as you take a deep step forward with your left foot to his right side and grip his right wrist with your left hand; your right hand slashes into his right elbow to bend his arm.

471. Allowing his held wrist to turn within your grasp, raise his captured arm.

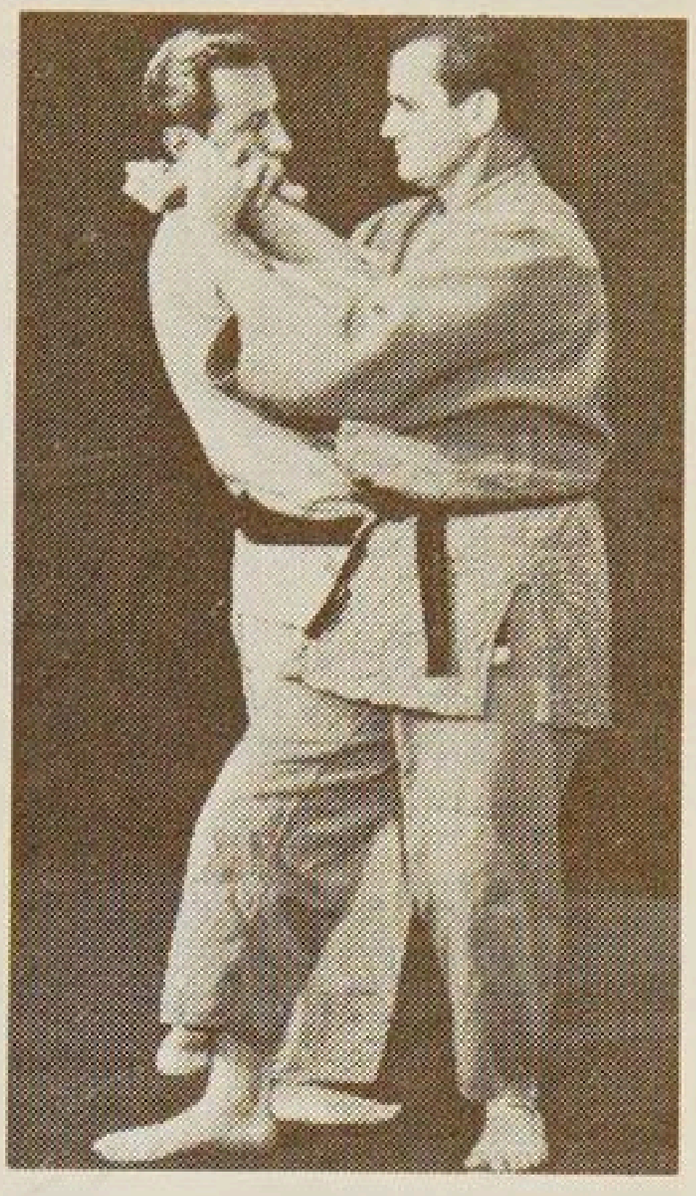
472. Take a second step forward with your right foot; as you step, reach under his arm with your right hand and then around to clasp your own left hand. His arm must be kept bent. Pressure is applied by bending your upper body forward and twisting to the left.

470

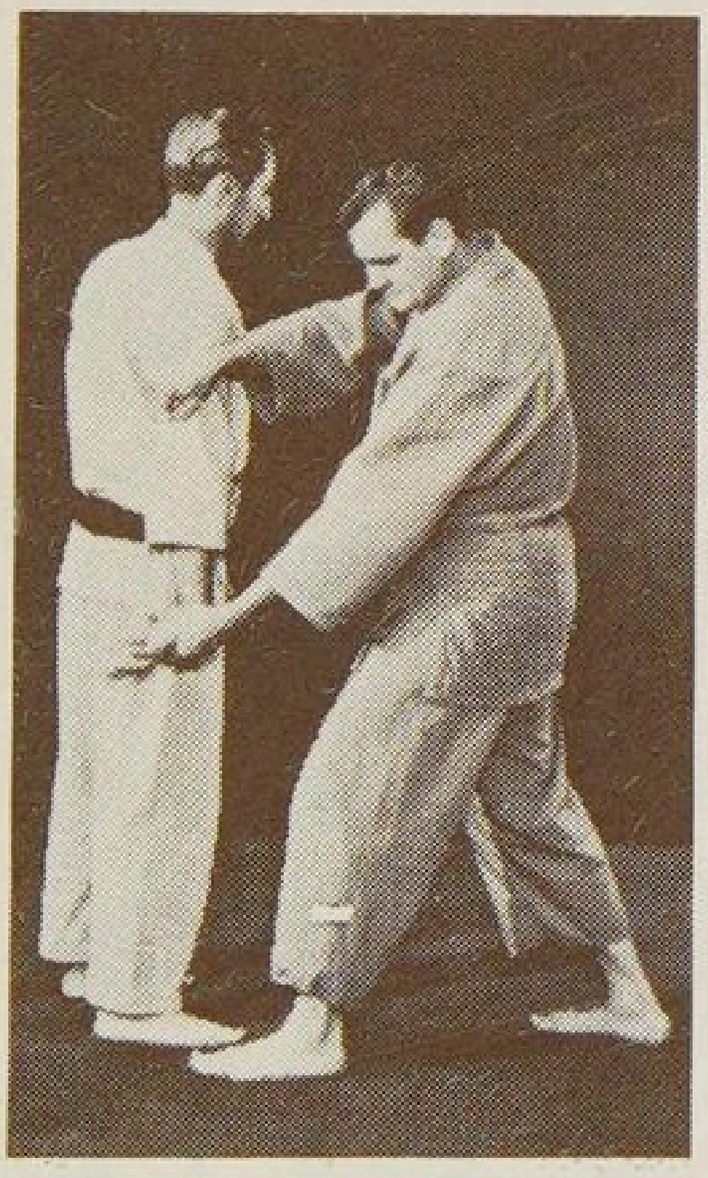
471



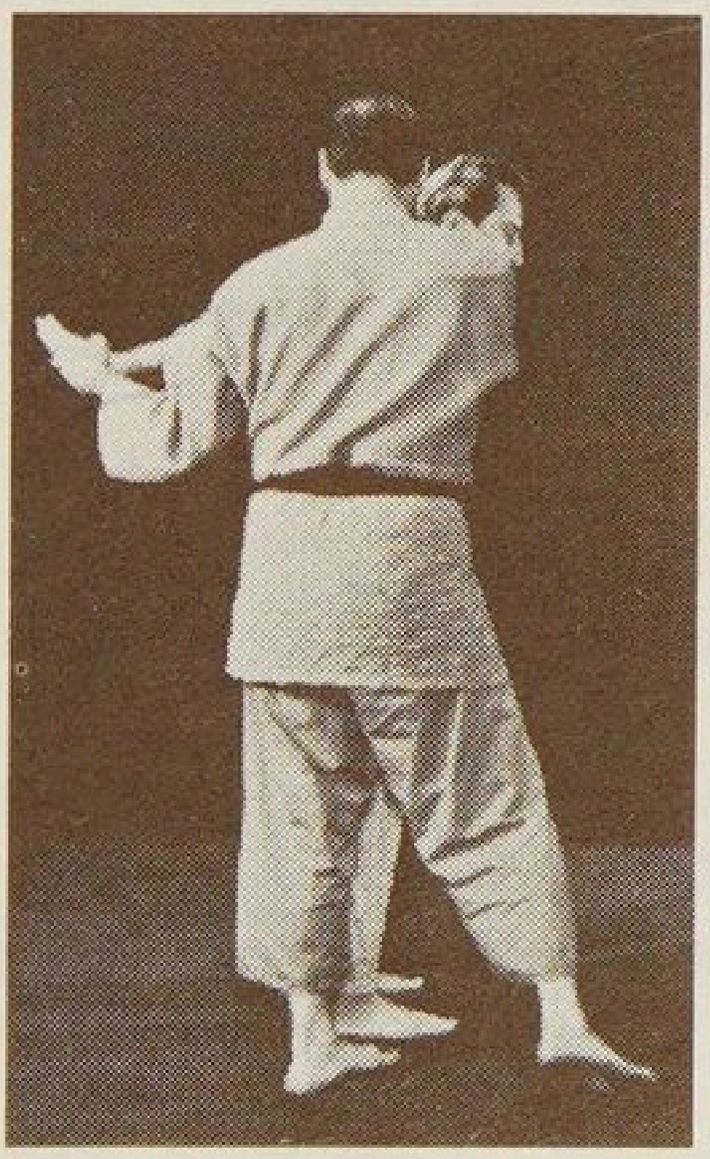
472



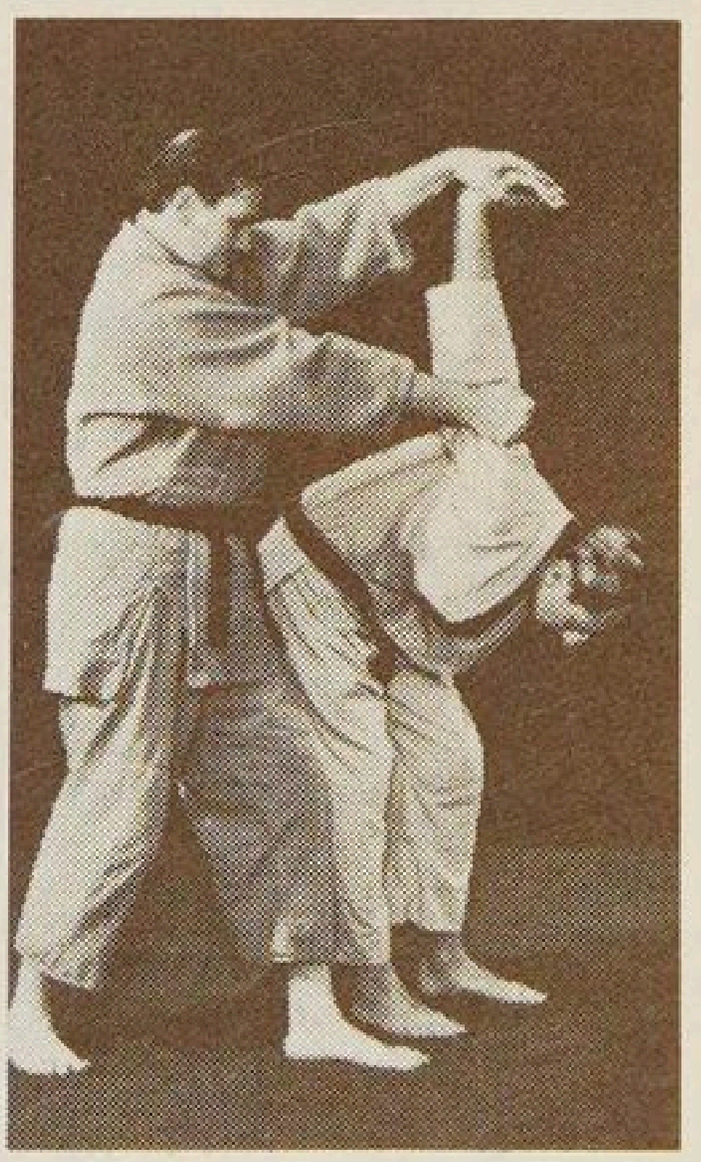
473



474



475



Elbow and Wrist Lock

473. Left partner offers no resistance as you take a deep step forward with your left foot to his right side and grip the back of his right hand with your left hand and bend it double; with your right hand grip cloth at his upper arm, just above the elbow. Pressure is applied by pushing your hands toward each other.

474, 475. Turning clockwise, pivot on the ball of your left foot and back around into a T-position at his right side; as you turn, raise his captured arm as shown. Maintain the pressure throughout.

Bent Arm Lever With Pivot

476. Left partner offers no resistance as you take a deep step forward toward his right side and grip his right wrist with both of your hands.

477, 478, 479. Turning clockwise, back around making a full circle; as you turn, raise his arm and hold it high without releasing your grip. The turning action of your body will bend and twist his captured arm into the back bent position as shown in 479. Pressure is applied by levering his arm down toward his back as you lean forward slightly.

Under Arm Pin

480. Left partner offers no resistance as you grip his right wrist with your right hand in an unnatural grip.

481. Pull his right hand into your left side and reach over his held arm with your left hand.

482. As you pin his held arm into your body with your left arm, release your right-hand grip and place it at his right shoulder.

483. Place your left hand onto your own right wrist; step forward with your right foot into a T-position. Pressure is applied by leaning your upper body back slightly as you raise your left forearm and push back at his shoulder with your right hand.

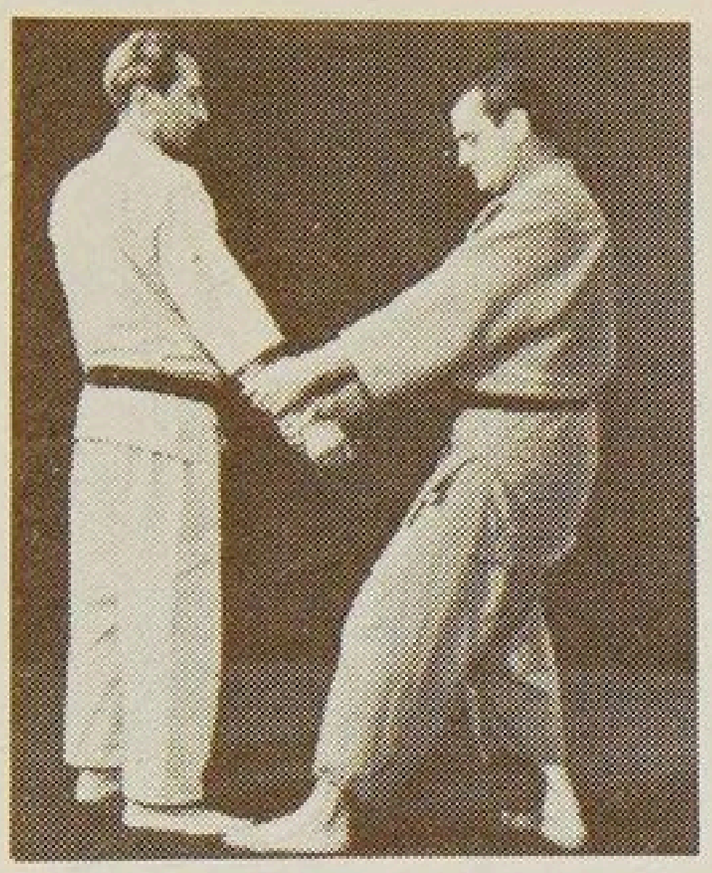
Choke With Arm Lever

484. Left partner offers no resistance as you take a deep step forward with your right foot to his right side; using a natural grip, grip his right wrist with your right hand.

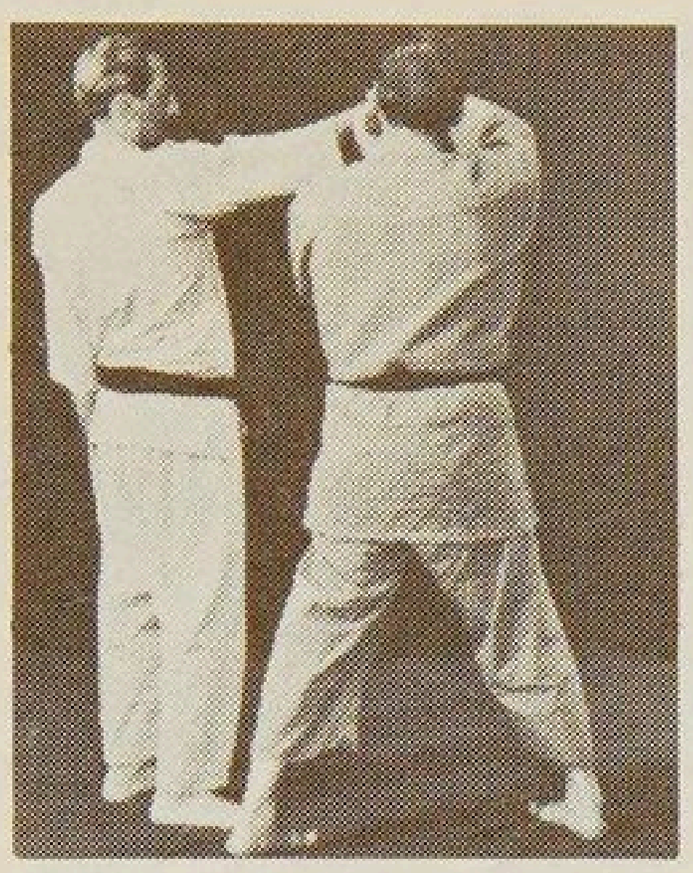
485, 486. Moving clockwise, step around to his rear with your left foot and place it between his feet. As you turn, reach around and grip his collar at his right side with the bony part of your forearm against his throat.

487. Step back into a T-position with your right foot. Pressure is applied by levering back against his throat with your left arm pulling his captured arm back against your chest.

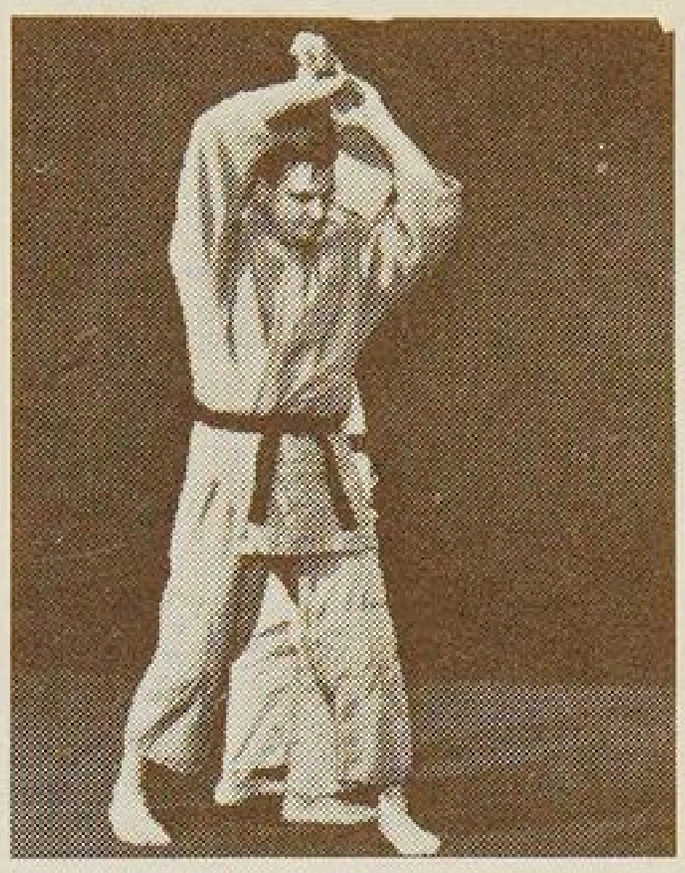
476



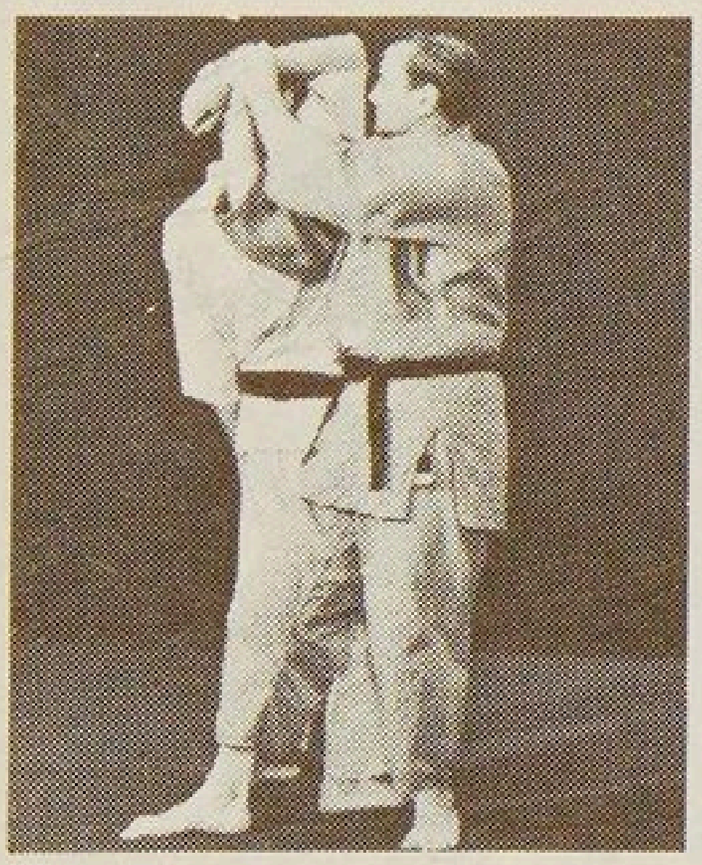
477



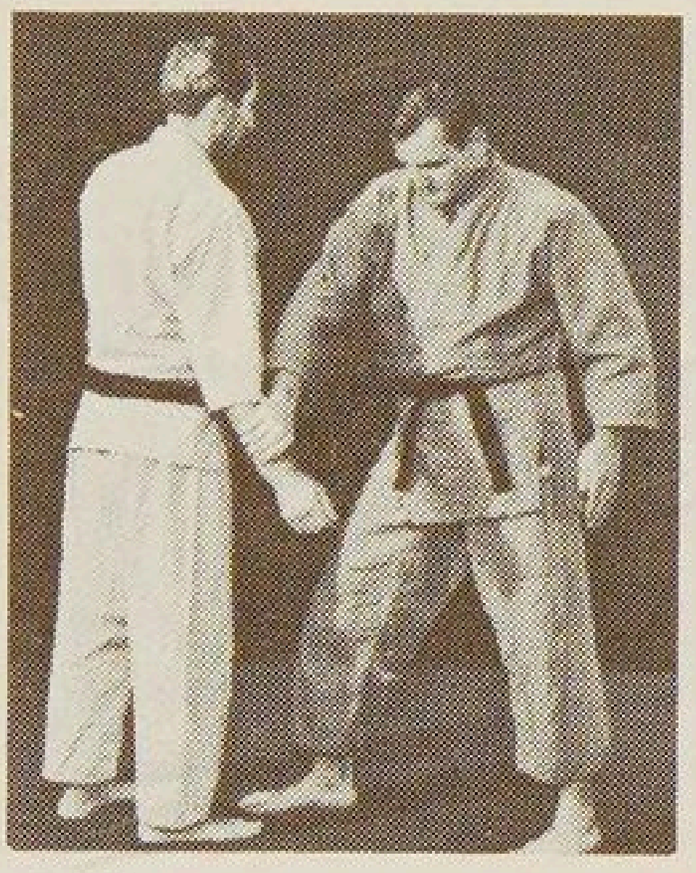
478



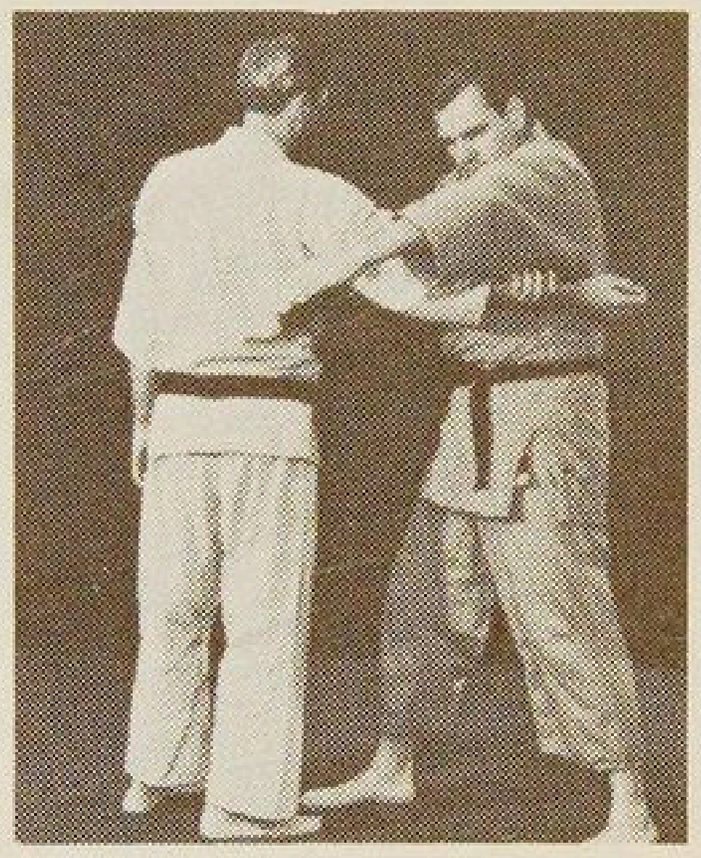
479



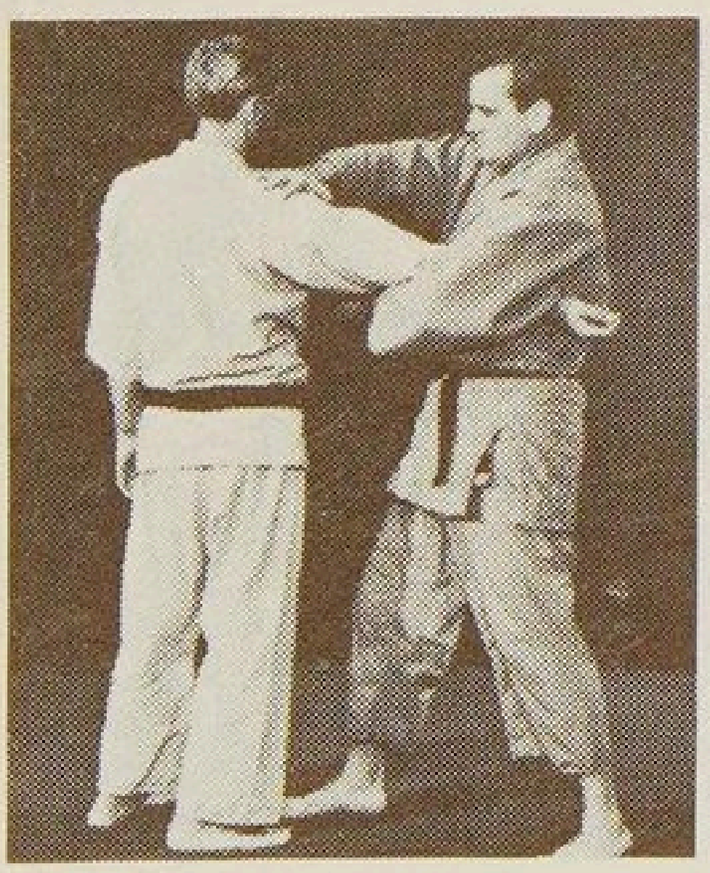
480



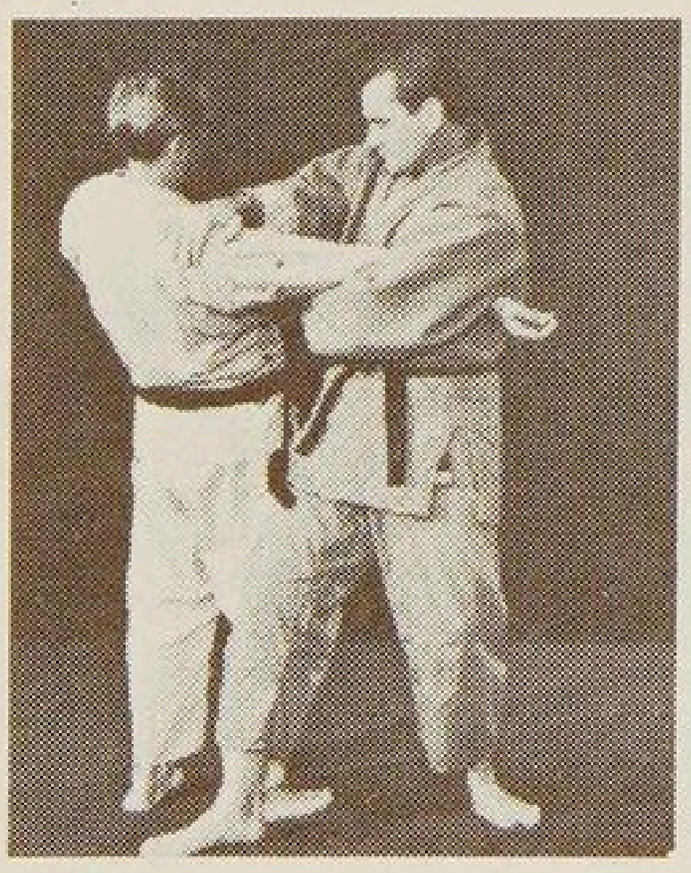
481



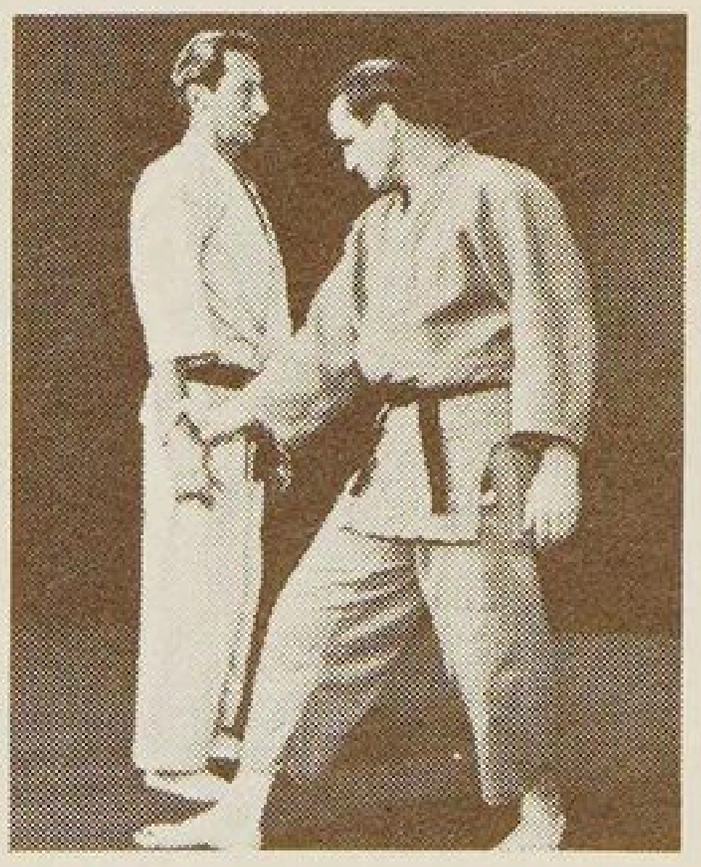
482



483



484



485

486

487

USES OF HOLDS AND LOCKS:
Showing Attack, Defense, and Takedown

Bent Arm Lever Lock

488. Left partner simulates high reaching grab toward the face; you slash-block the reaching arm.

489. Apply bent arm lever lock.

490. Take him down by tripping him back over your right leg or applying kick back throw. Maintain the hold, following his body action with yours for his safety. On the ground, continue to apply pressure.

Elbow and Wrist Lock

491. Left partner simulates low reaching attack; you slash into his forearm nerve.

492, 493. Apply the lock.

494. Take him down by levering down with more pressure on his wrist and adding body action to effect the takedown. On the ground, maintain the hold.

Bent Arm Lever with Pivot

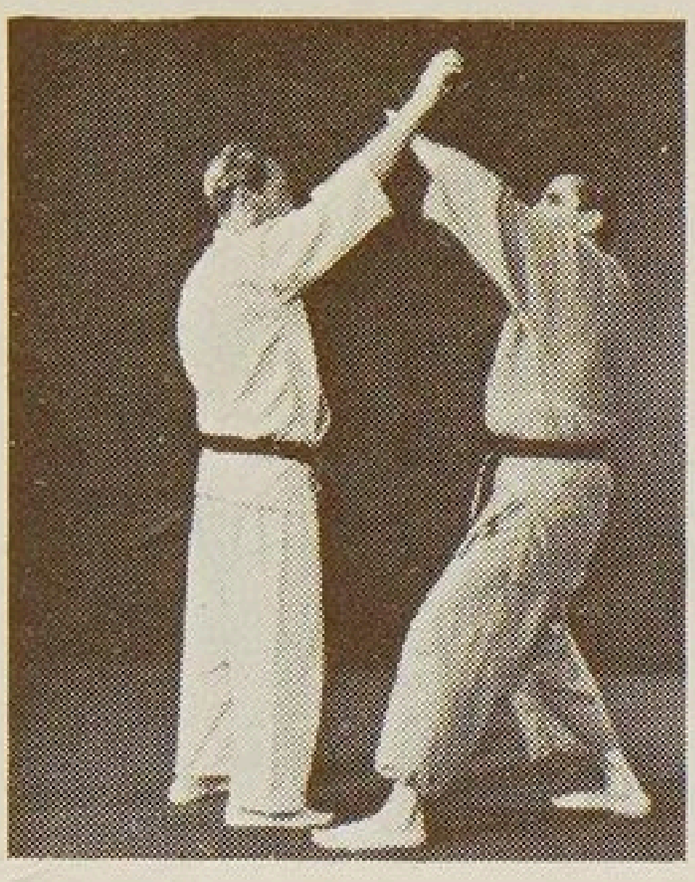
495, 496. Left partner reaches out and you grip his wrist with both hands; he resists the grip by pulling back his held arm, bending it.

497. Using his movement to aid you, apply the hold; without hesitation . . .

498. . . . apply kick back throw.

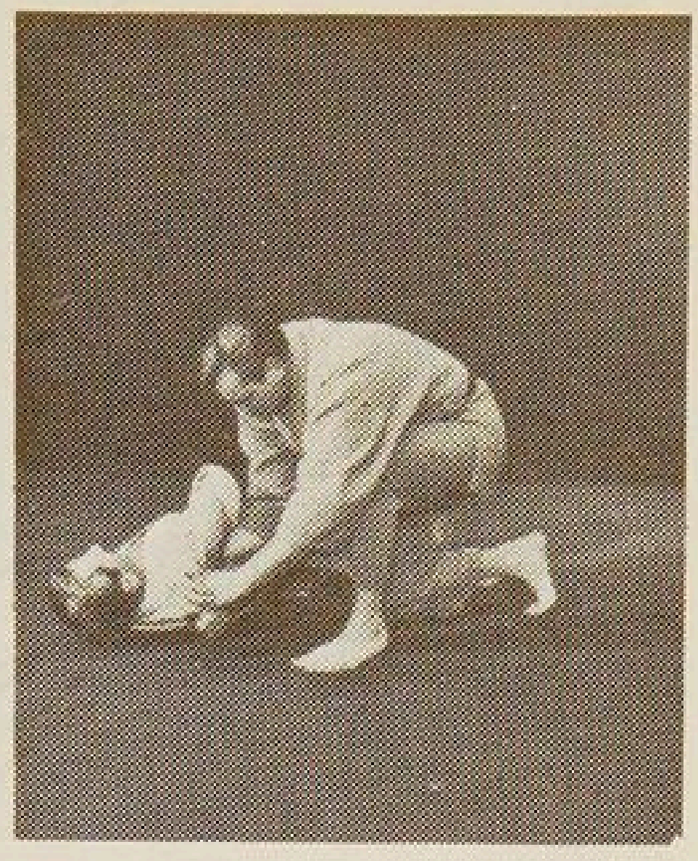
499. Follow his body action with yours for his safety. On the ground, continue to apply pressure.

488



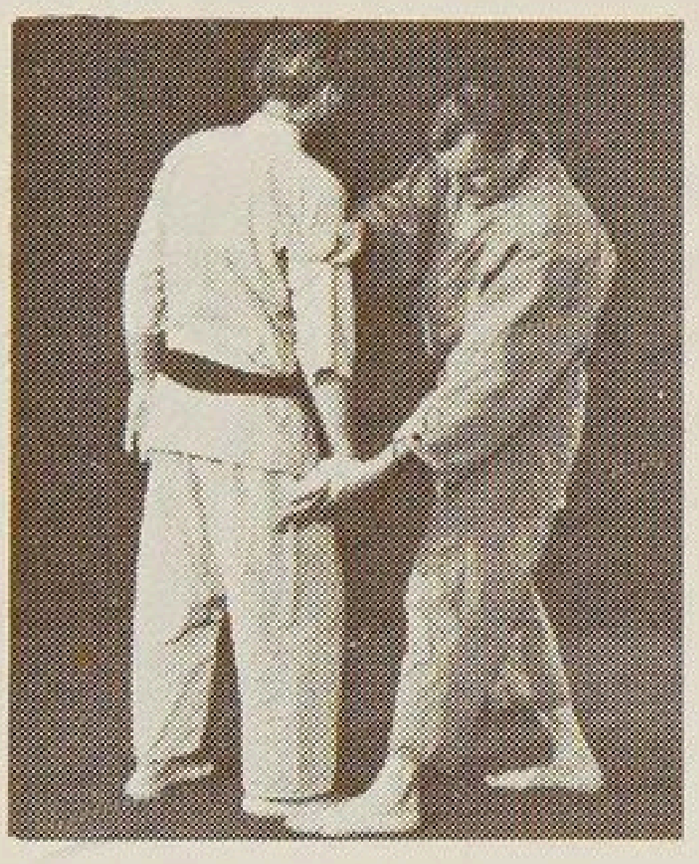
489

490



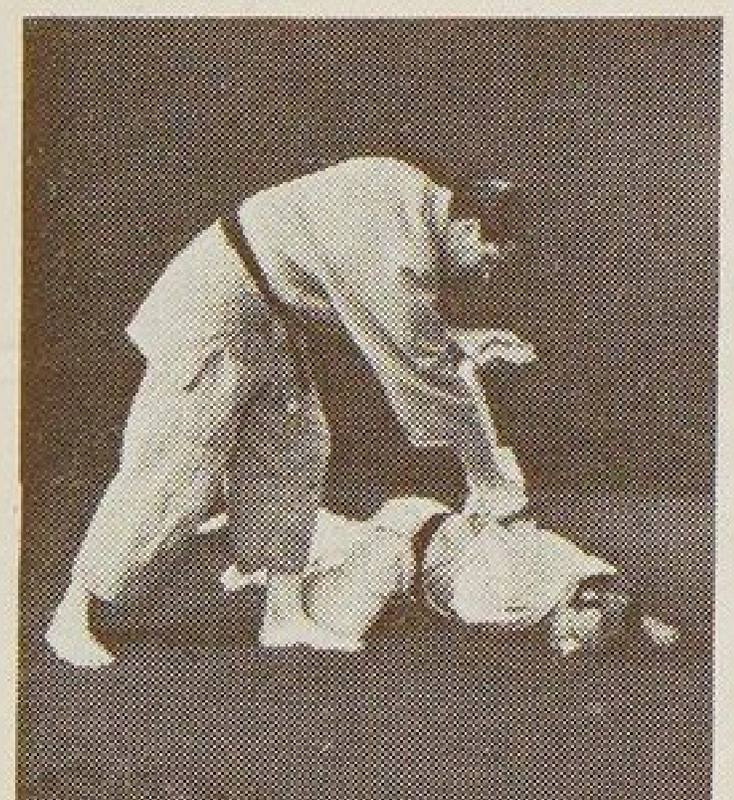
491

492

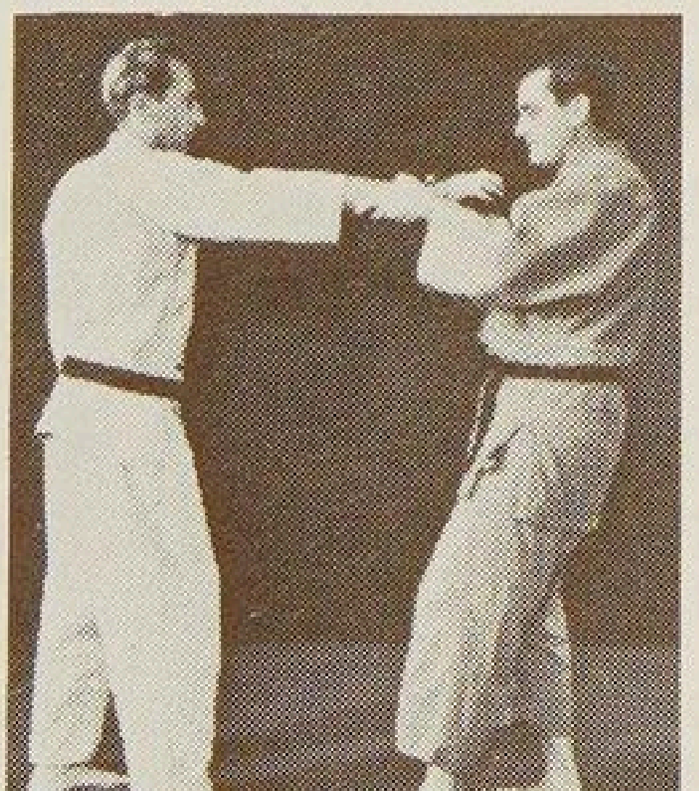


493

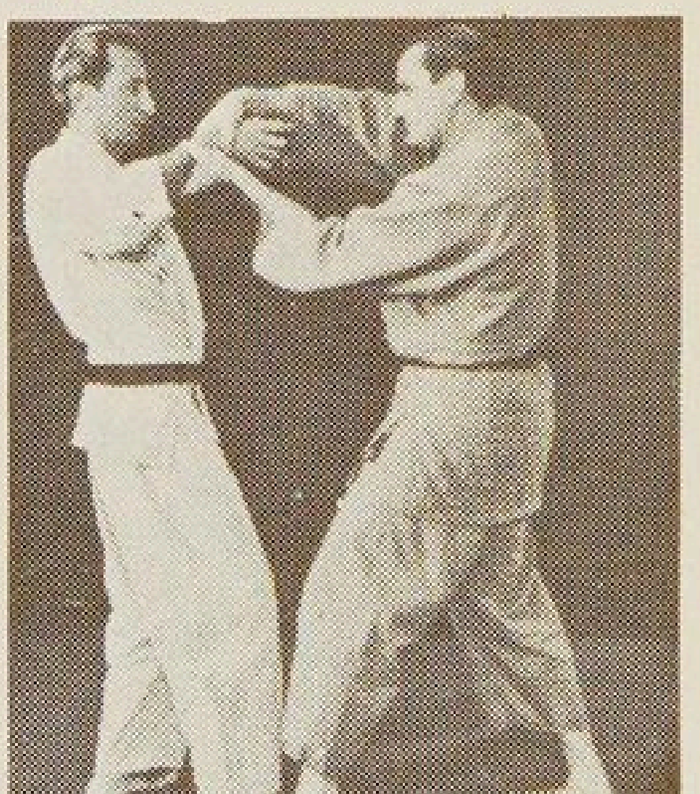
494



495



496



497

498

499

Under Arm Pin

500, 501. Left partner simulates reaching attack; you slash the reaching forearm and apply under arm pin.

502, 503. Use a back trip for the takedown; maintain pressure as you follow his body action with yours. Continue to apply pressure on the ground.

Choke With Arm Lever

504. Left partner simulates forward reach; you sidestep and parry.

505. Apply choke.

506. Buckling his knee with your foot, pull him further off balance and take him down. Be very careful to time your body action with his; special safety precautions must be taken in practice and for test demonstrations. After the choke is taken, the action can be quite slow and should be smooth. Quick, jerky movements can be dangerous.

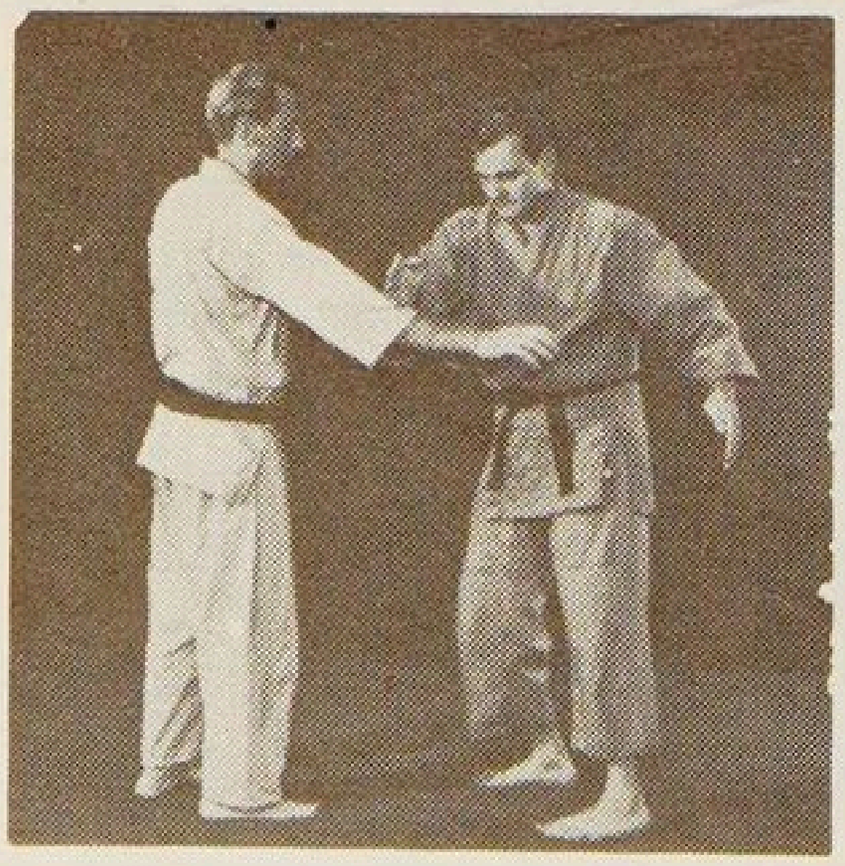
507. At the finish, you are on your left knee. In addition to simulating continued choke pressure, lever his captured arm across your leg, as shown.

THROWS

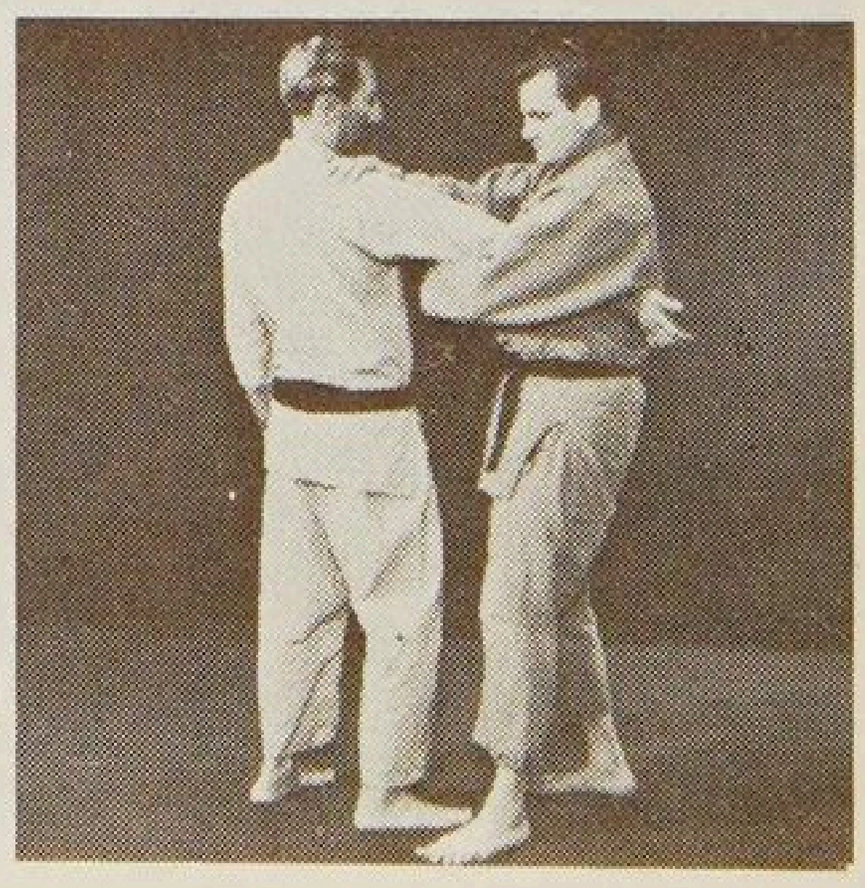
Leg Lifting Throw

508, 509, 510. After pre-throwing action using blocking, slashing, and kicking, grip left partner in standard throwing fashion as you step in with your left foot and point the toe away from him. Positioning the foot in this manner is essential to the success of the throw; this leg is going to bear your weight during the critical part of the throw.

511, 512. Putting your weight onto your left foot, hit his left leg with the upper part of your right leg and follow through with a high sweeping action; as you lift with your leg, twist him down and around with your arms.



500

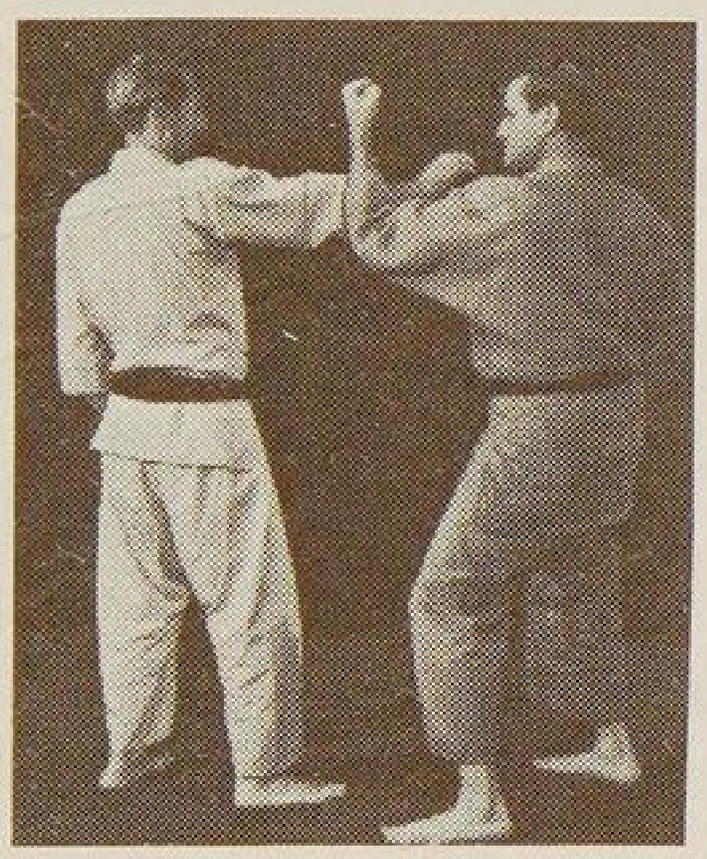


501

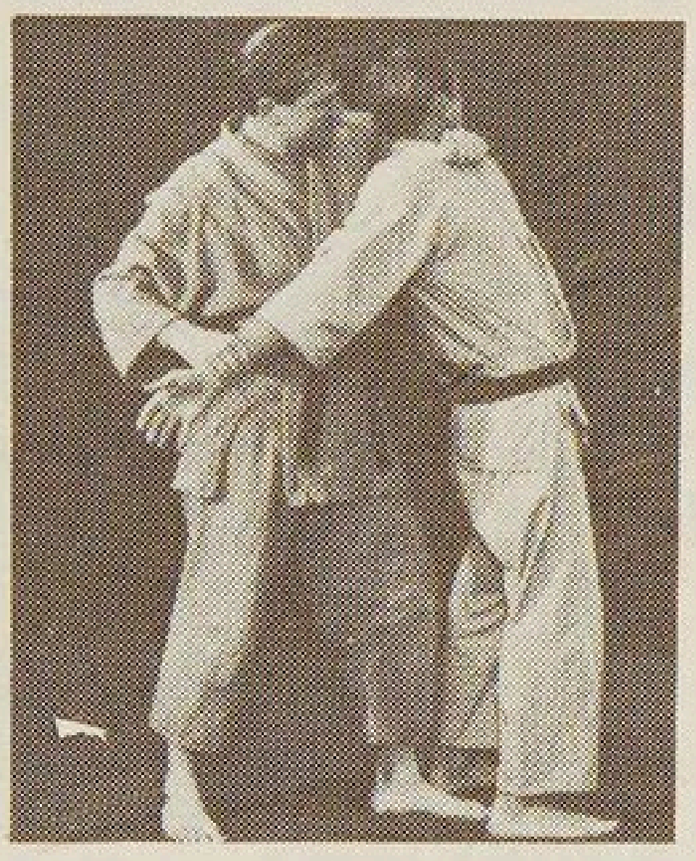
502

503

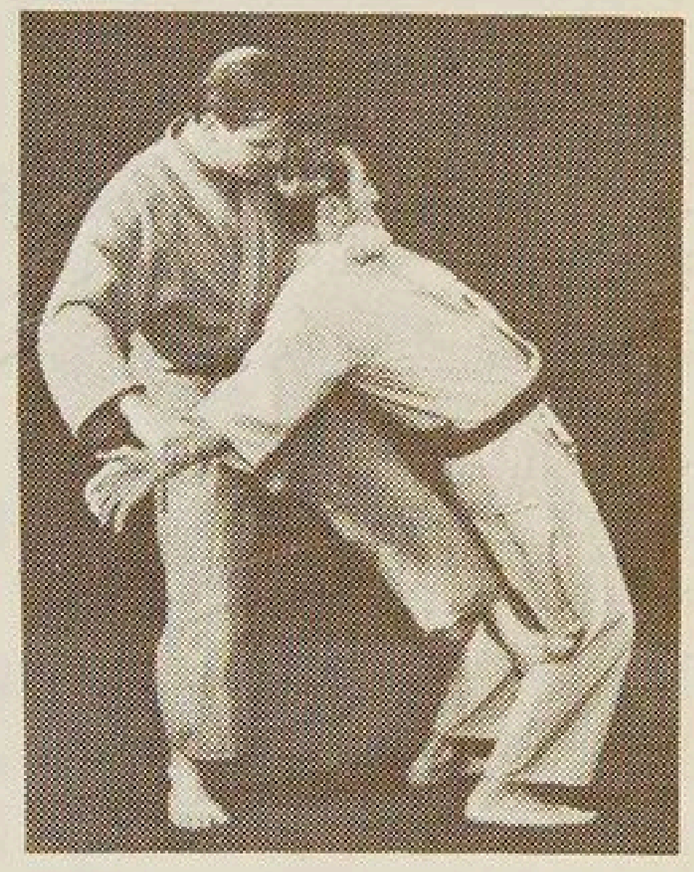
504



505

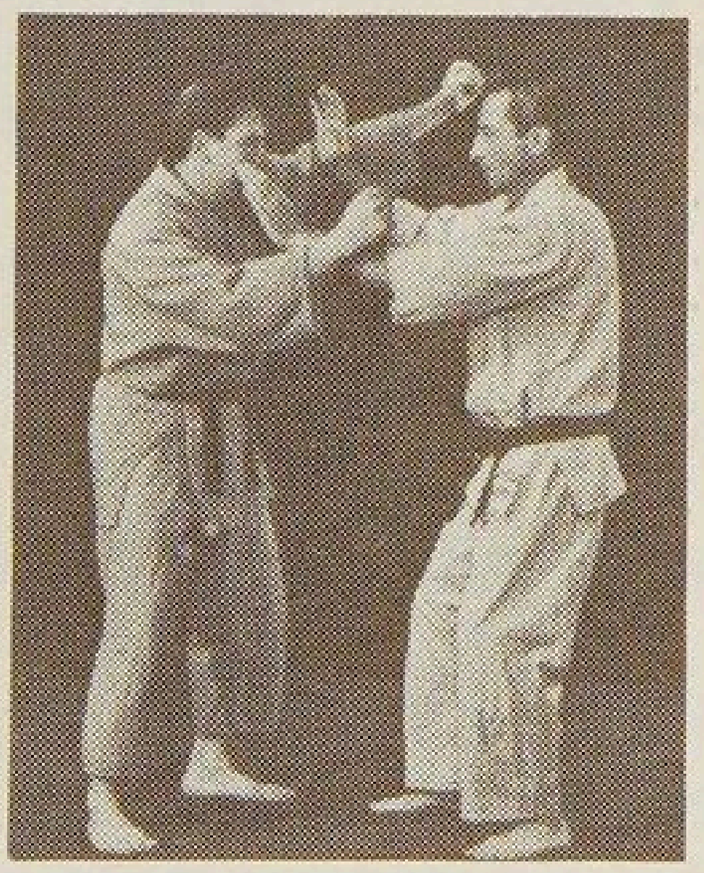


506

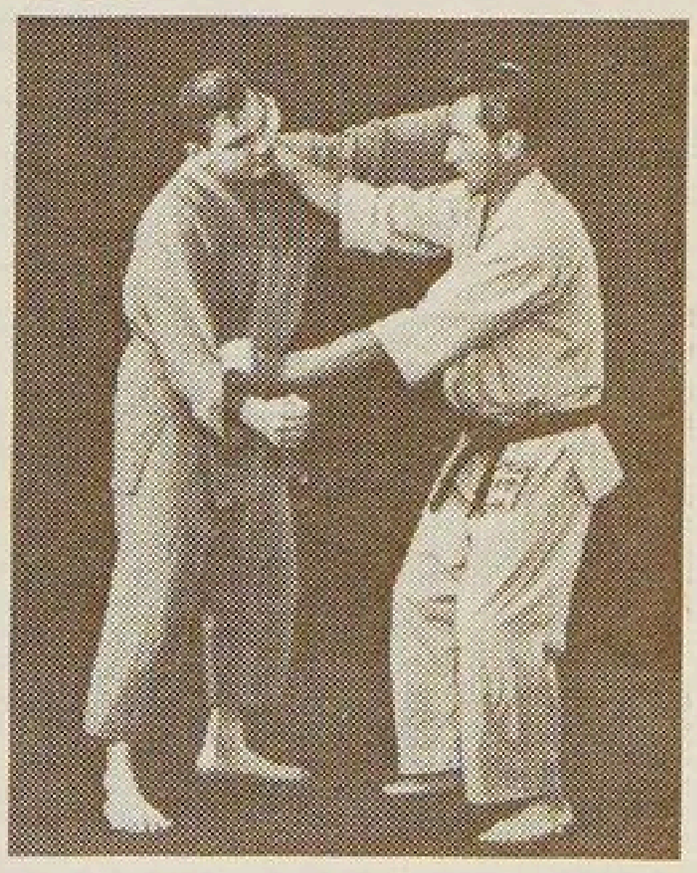


507

508

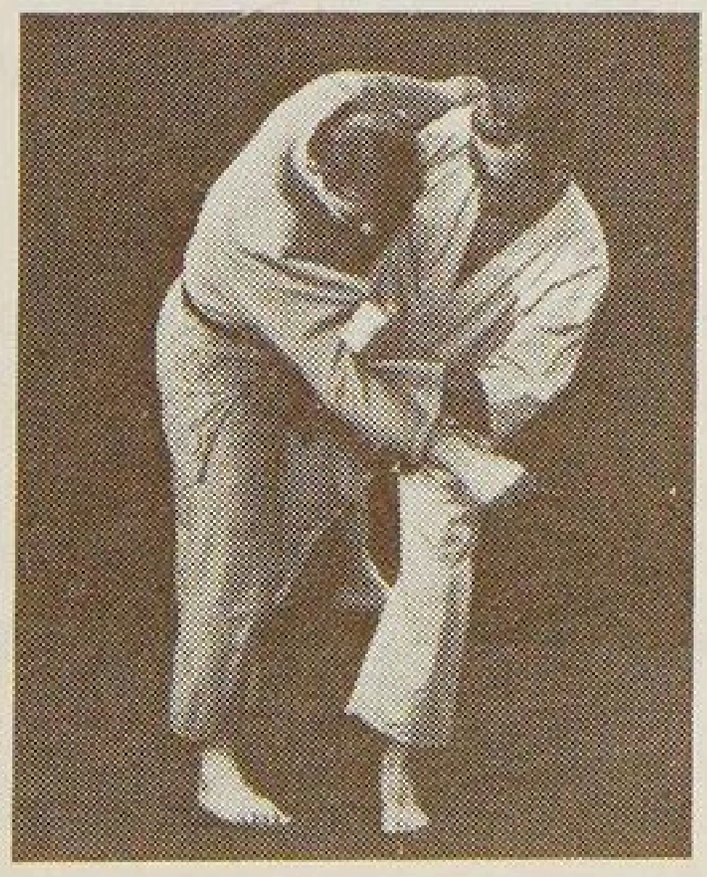


509



510

511



512

Knee Block Throw

513. First apply pre-throwing action, maneuvering left partner into a forward position.

514. Using his forward movement to assist, sidestep with your right foot (toe pointing toward him) and place the bottom of your left foot directly beneath his right kneecap.

515. Lift up and back sharply at his right leg as you pull him into your chest and then twist in a wheeling counter-clockwise motion with both your arms.

Back Straight Foot Throw

516. After usual pre-throwing action, grip left partner in standard throwing fashion as you take a deep step to his right side with your left foot and begin to break his balance backward.

517. Continuing the arm action, place your right leg stiffly behind both his legs, locking your right ankle firmly into his left ankle; your left knee is slightly bent.

518. Throw is completed by pulling him into your chest with both arms and then twisting your body sharply around to the left.

DEFENSES AGAINST ATTACKS

Close-In Fist Attack — Thrust and Double Kick

519. The situation is one in which your adversary is in a fighting stance, clearly intends to attack, and there has been sufficient warning for you (right) to assume a fighting stance as well.

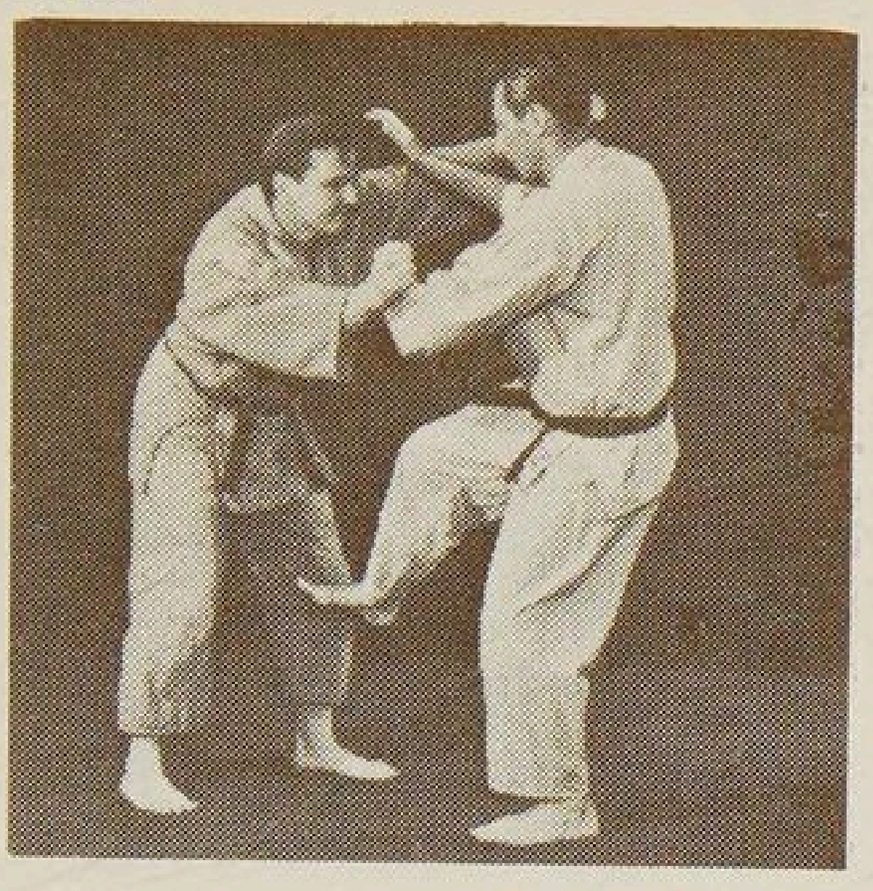
520. You do not wait for him to attack; you create a diversionary action by thrusting into his face.

521. His blocking reaction to your diversionary tactic allows you to apply your important defense, a kick into the knee.

522. As he reacts to the kick, you follow with a second kick into the midsection. In most cases, this would be enough to subdue him.

523. If necessary, when he is hurt, go around to his rear and apply a back takedown.

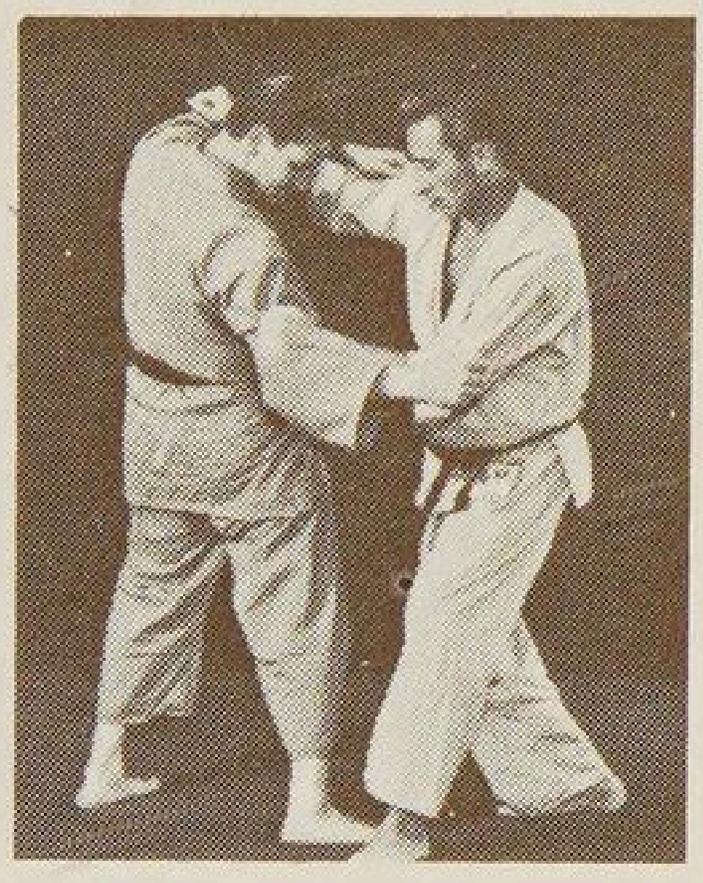
513



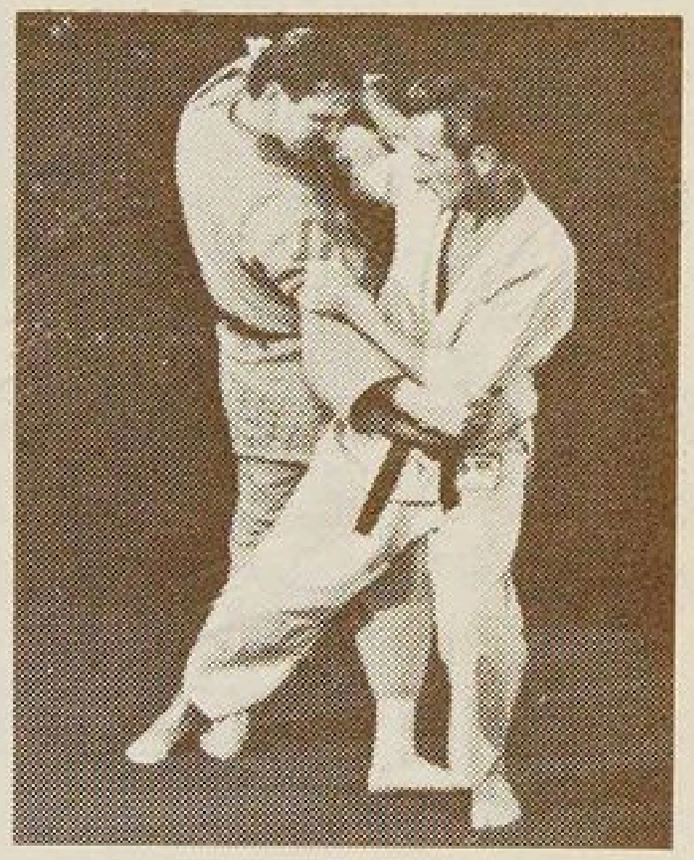
514

515

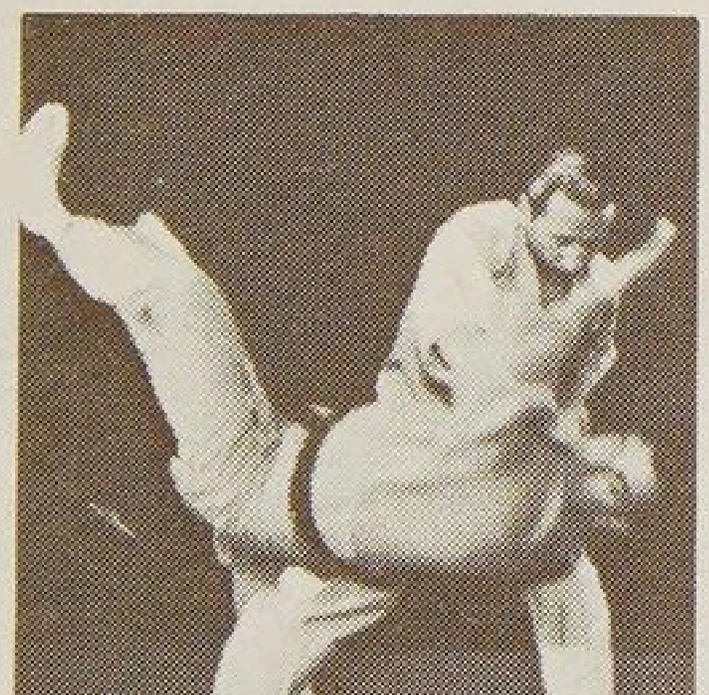
516



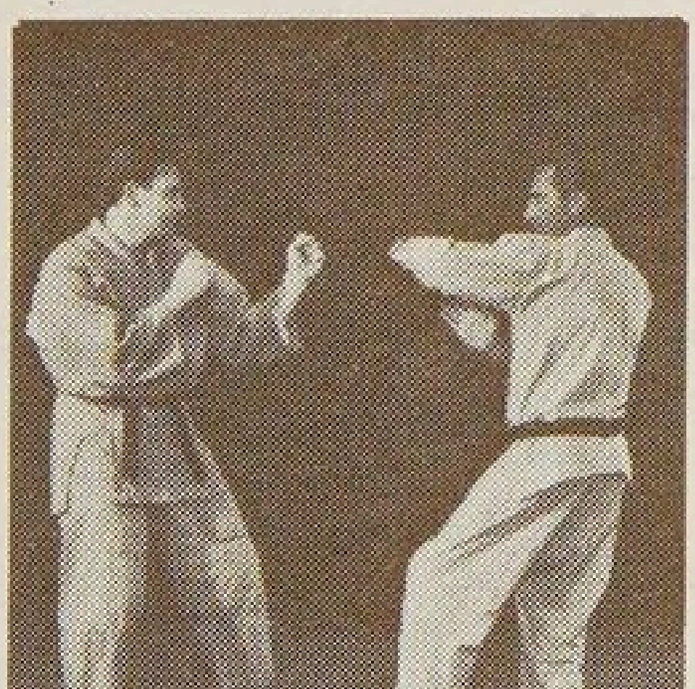
517



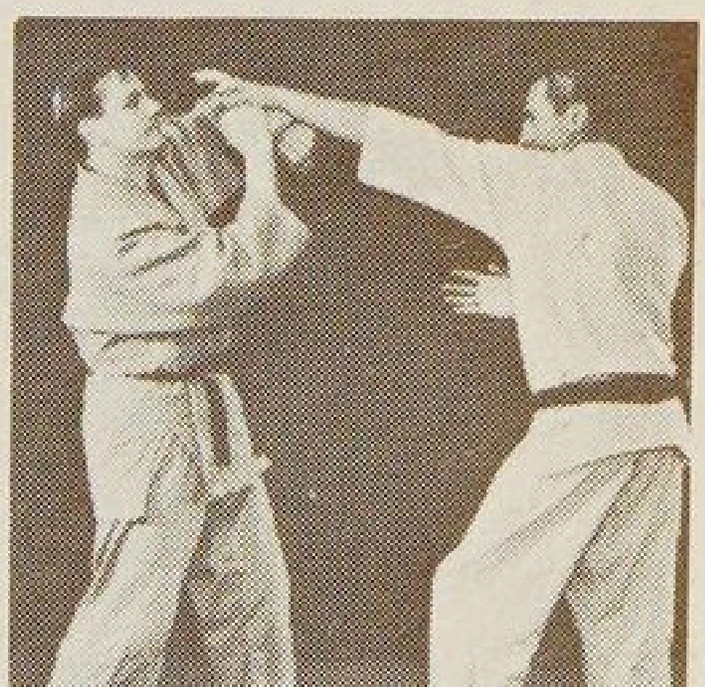
518



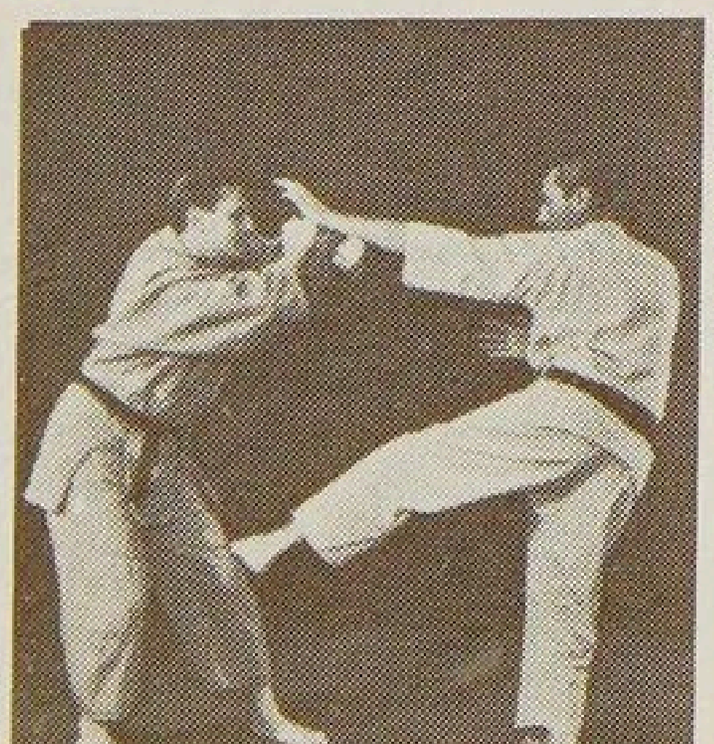
519



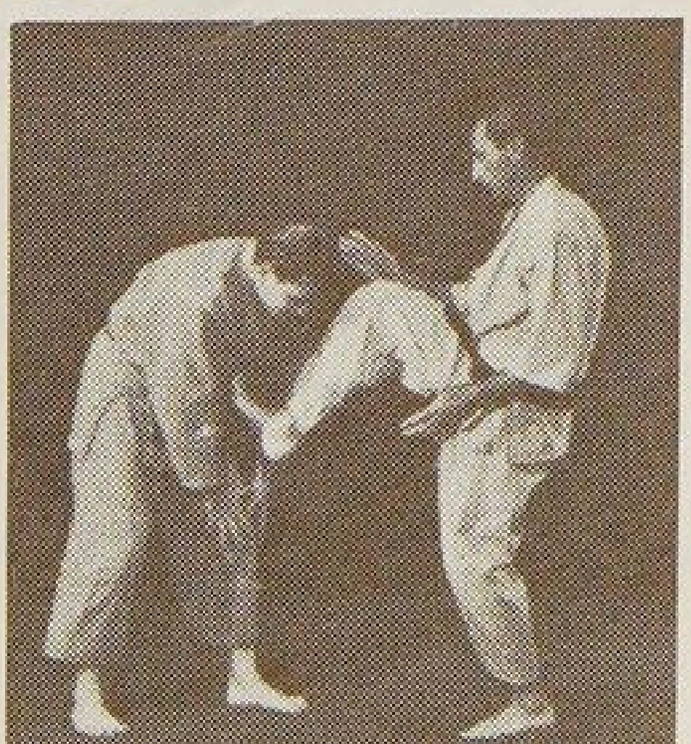
520



521



522



523

Back Attack — Arm Pin

524. Left partner simulates arm pin from behind. You react as though there is a second adversary in front of you, kicking at the second person.

525. When you have hurt the front adversary, kick into the shins of the man behind you and slash back into his thigh.

526, 527. Continue kicking until he is hurt, then turn sharply to your right. This tightens his hold on your left arm but somewhat frees your right arm. Jerk your right arm straight up for release and turn quickly counter-clockwise to face him; kick and hit as required, 528.

Back Attack — Wrist Grip

529. Left partner grips both your wrists from behind. You begin the defense by kicking at the imaginary adversary in front of you. Then, kick with force into knee and shin.

530. After hurting him with kicks, jerk one hand down at the part of his grip between the thumb and forefinger (the weakest part of the grip) for release.

531. With the released hand, immediately slash back into his neck . . .

532. . . . then, spin away; release the other hand with a jerky action. Continue to kick and hit as required.

Back Attack — Full Nelson

533. Rear partner applies full nelson hold.

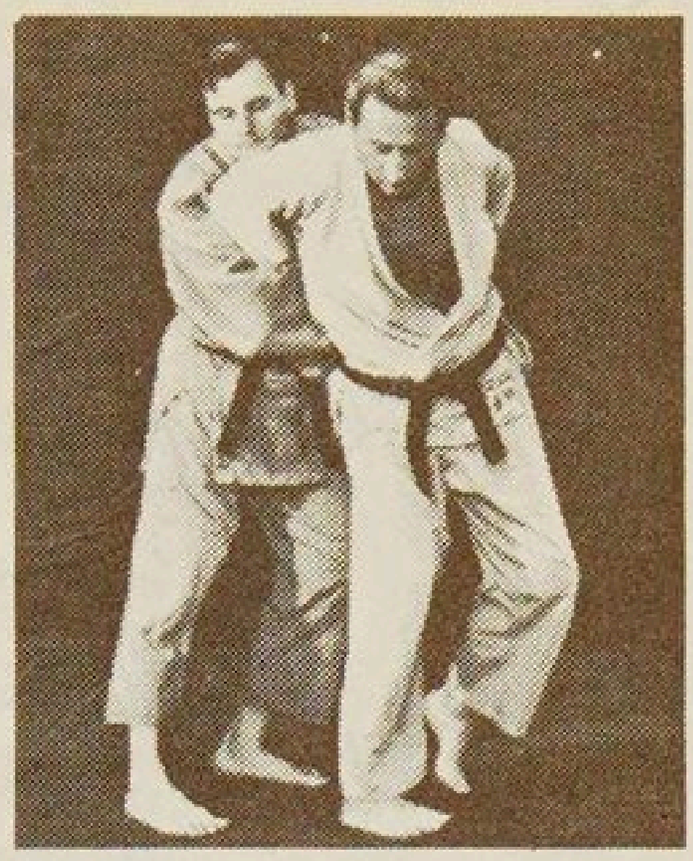
534. Clasp your hands at your forehead, as shown, and press back to get relief from the pressure. Kick with force into the knee and shin until you feel him loosen his grip and back up.

535. Sidestep with your right foot and place your left knee behind his right knee and sharply kick with your knee to buckle his leg.

524

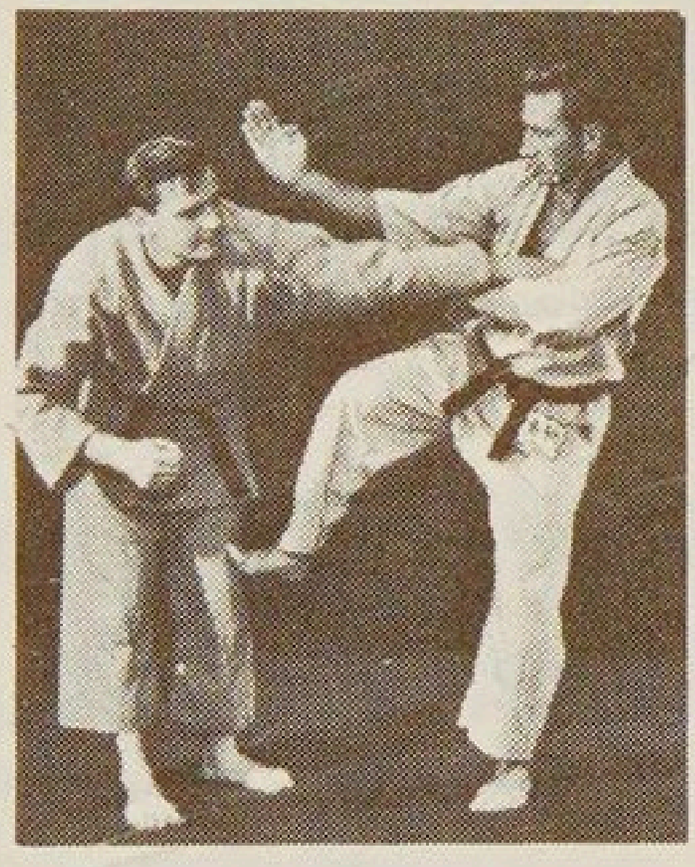
525

526

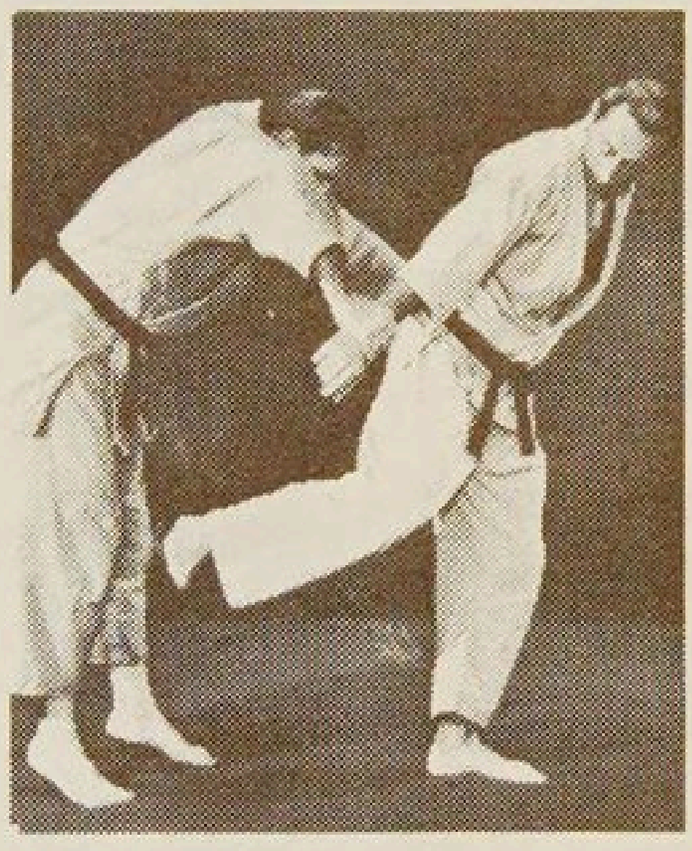


527

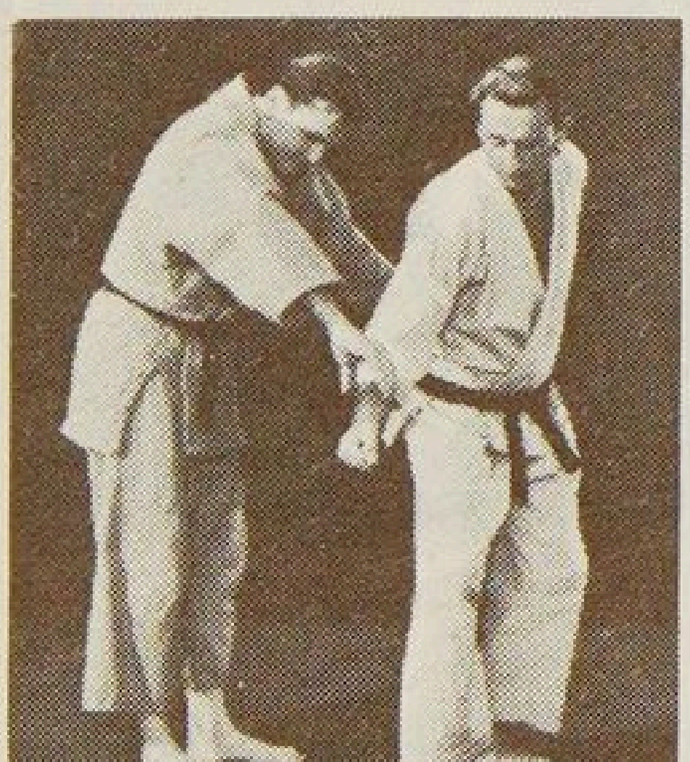
528



529

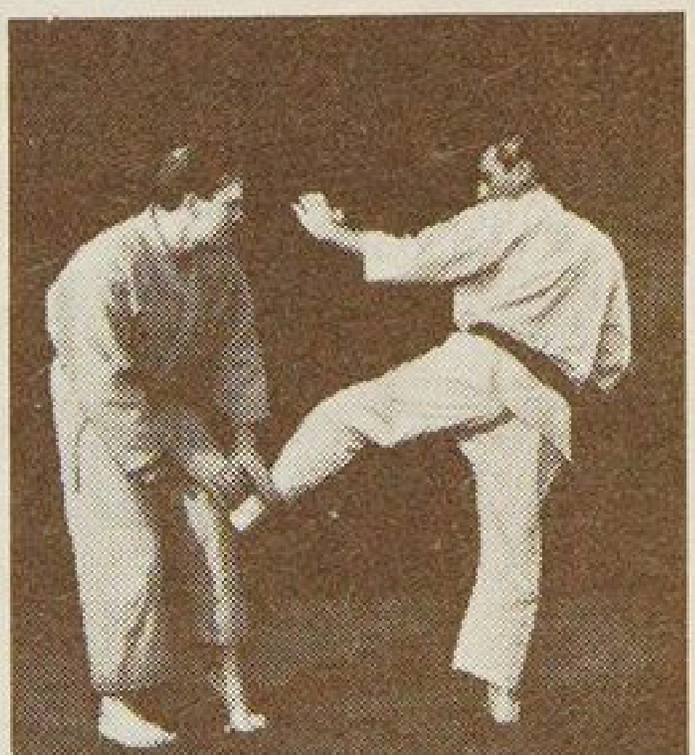


530



531

532



533

534

535

536. As you feel him buckle, grip his left pant leg with your left hand and twist him backwards over your left leg. Assist the action by gripping his right pant leg with your right hand, pulling up and twisting.

Club or Stick Attack — Poking Style

A club or sharp stick or other pointed object (not a knife) is sometimes used in a poking style.

537. Left partner simulates poking stick attack; as the weapon comes toward you, leap to the side of the attacking arm . . .

538. . . . and, without hesitation, kick with force into leg.

539. When he is obviously hurt, grip cloth at his shoulder and buckle him backward with a sharp kick into the back of his knee to effect a takedown.

Club or Stick Attack — Short End or Short Stick

The *style* of holding the club or stick makes it a short weapon even when the stick itself is longer. The situation would be the same if the attack were being made with a small stick.

540, 541. Left partner simulates threat of hitting with short stick; you leap back out of range of his hitting arm and, without hesitation, kick into the knee.

Continue hand and foot blows as needed and work your way around to his rear. Apply takedown if necessary.

Chain or Long Flexible Weapon Attack

Timing is very important in response to attack when your adversary is using a flexible weapon such as a chain or rope. If you begin your action too quickly you lose the element of surprise.

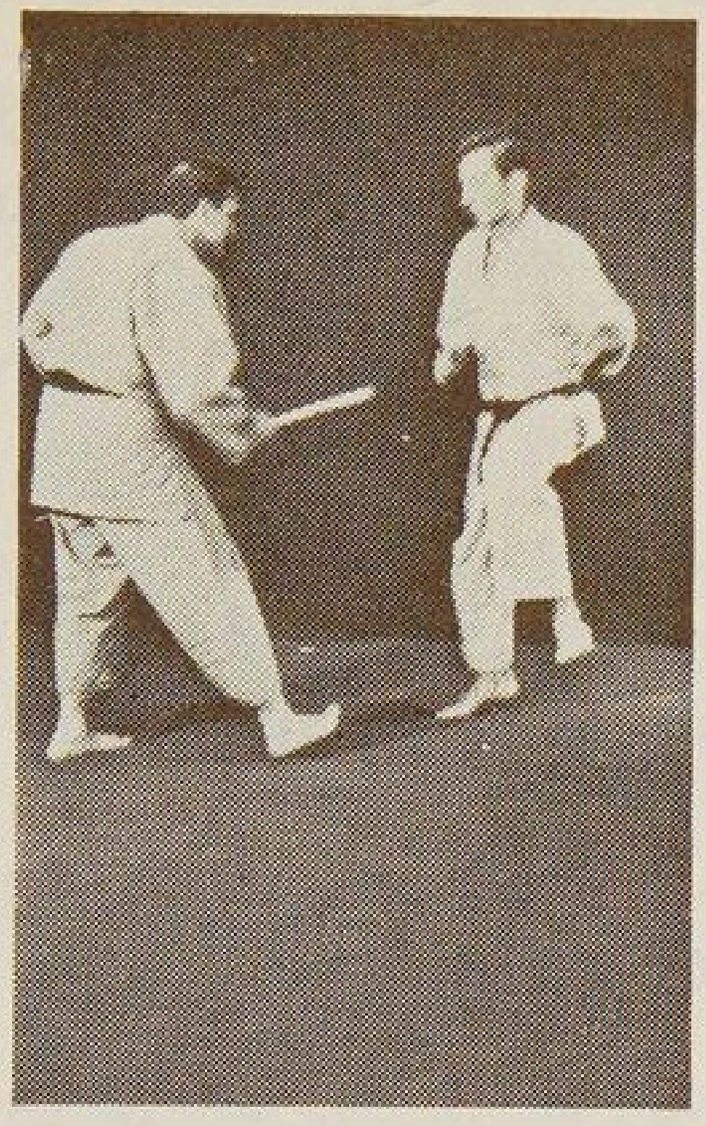
542. Left partner swings high and wide with a flexible weapon, an attack which is always signaled because of the nature of the action. As the swinging weapon approaches, take a long leap back. This leaping action puts you out of range of his attack, but also out of kicking range so that you must, when the swinging weapon has gone past you, immediately take a leap forward . . .

543. . . . kicking as you leap.

544. After the first kick, capture his striking arm and continue kicking as necessary. If needed, you can finish with a rear takedown.

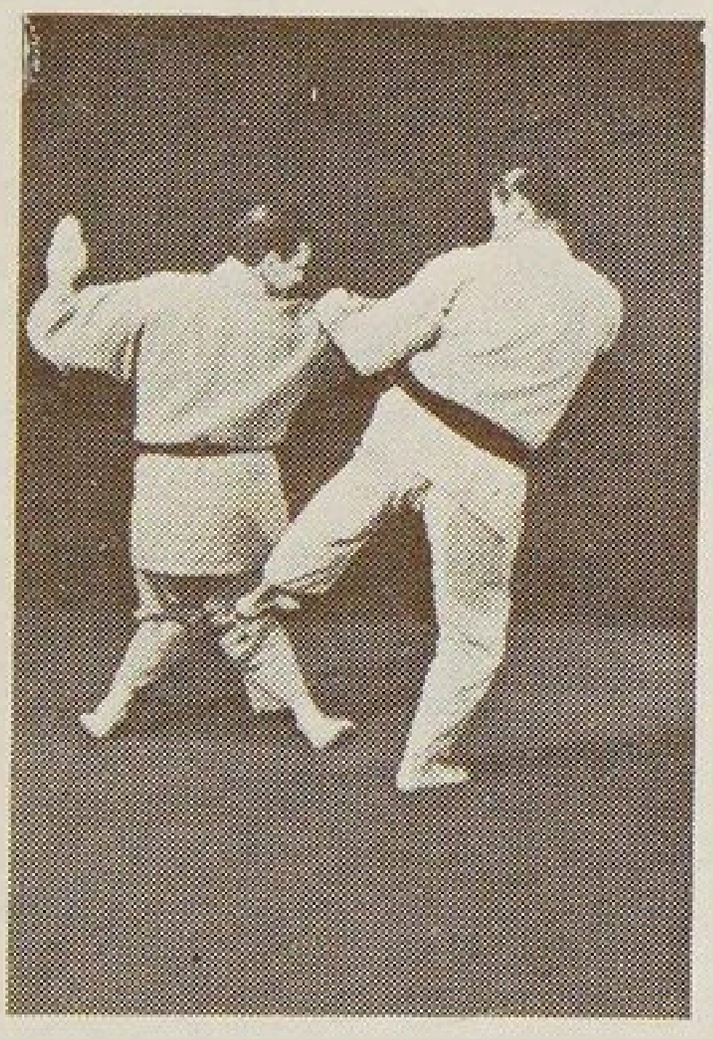
536

537

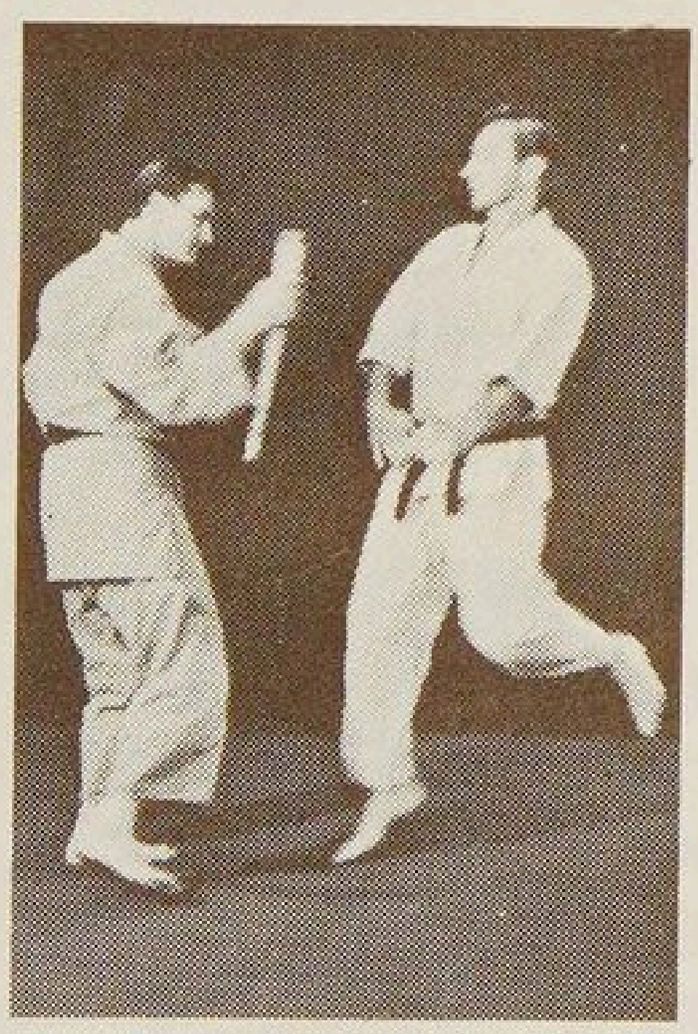


538

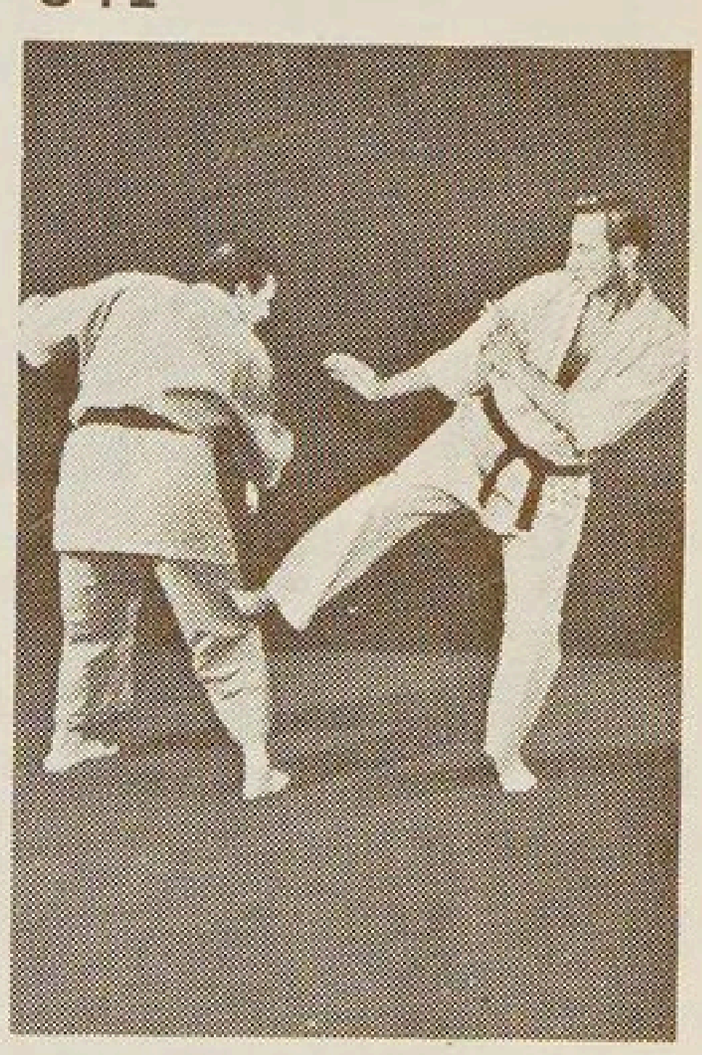
539



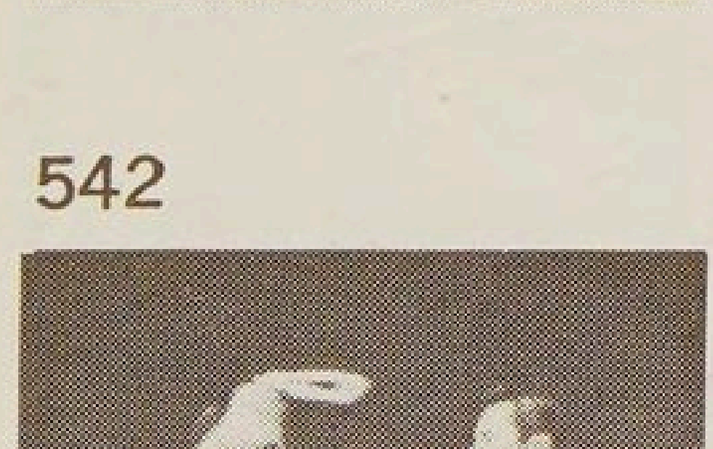
540



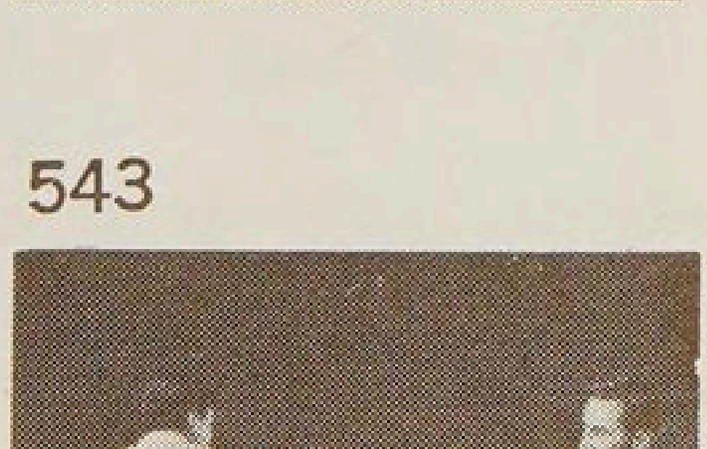
541



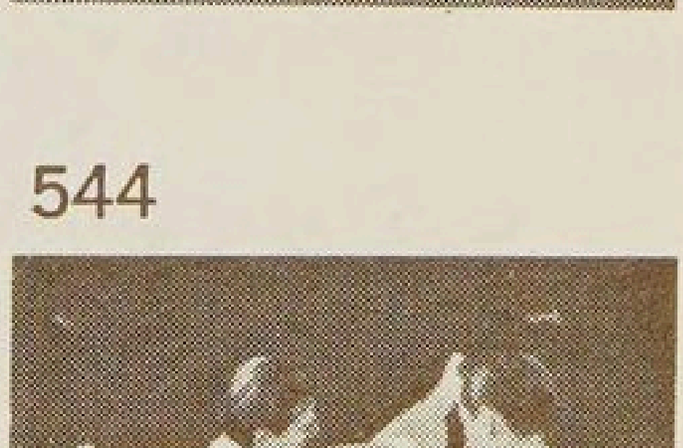
542



543



544



Knife Attack — Cornered Front Threat

545. Left partner simulates threat of knife attack; you are presumably cornered and cannot move from your position.

546. Using subtle movement with your right hand, distract his attention.

547. While he is diverted, reach across and grip his knife hand wrist and lock it out so that it cannot bend; at the same time, stab into his eyes or throat with your right hand.

548. Immobilize his knife hand by gripping it with your right hand also; continue kicking until he is subdued or drops the knife.

Knife Attack — Cornered Back Threat

549. Left partner simulates threat of knife attack from the rear; you are presumably cornered and cannot move from this position. Casually glance over your shoulder to see which hand holds the knife.

550. After knowing which hand holds the knife, you distract by making a subtle hand gesture to the opposite side — away from the knife hand.

551, 552. In the instant of diversion, turn to the outside of the knife hand and at the same time slash at the wrist or forearm of his knife hand. The turning action must be circular to bring you to his side; if you merely turn around to face him, you are still very vulnerable to attack. With the slashing hand, grip and immobilize his knife hand, and kick until he is subdued.

Gun Defense — Hip Style Threat, Arm Lock Ending

553. Left man threatens attack in style typical of experienced gunman. Distract with your right hand.

554. At the instant of diversion, grip his gun hand with your left hand, locking the action, twisting the muzzle away from you; as you grip, shift your weight to the right; then stab into the eyes or throat.

555, 556. When he is hurt, grip the gun with your right hand too and apply the bent arm lock as shown. Take the gun away from him when his arm is raised overhead; this is important, otherwise, as you finish the lock, the gun muzzle will pass in front of you.

545

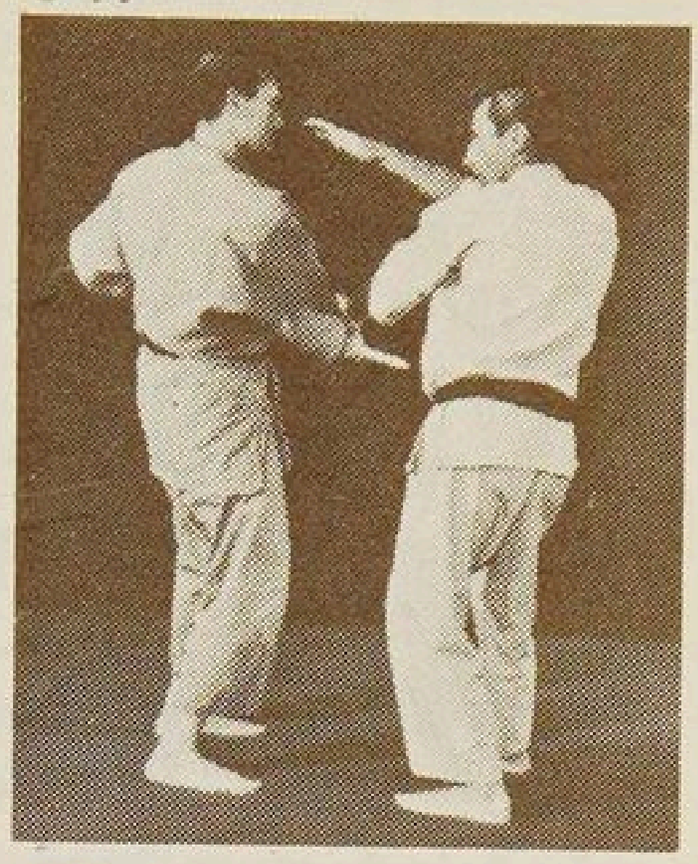
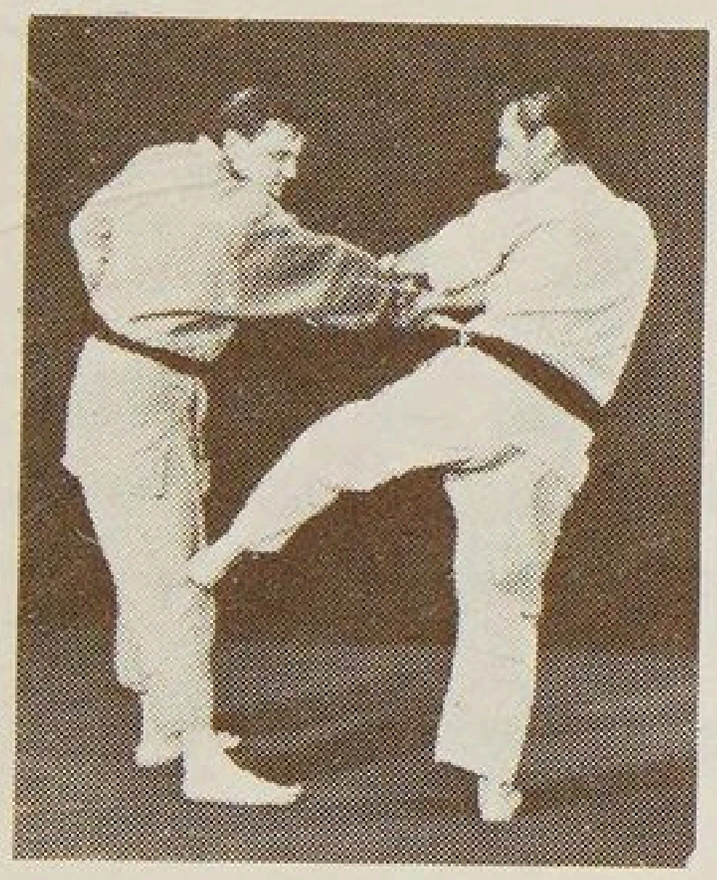
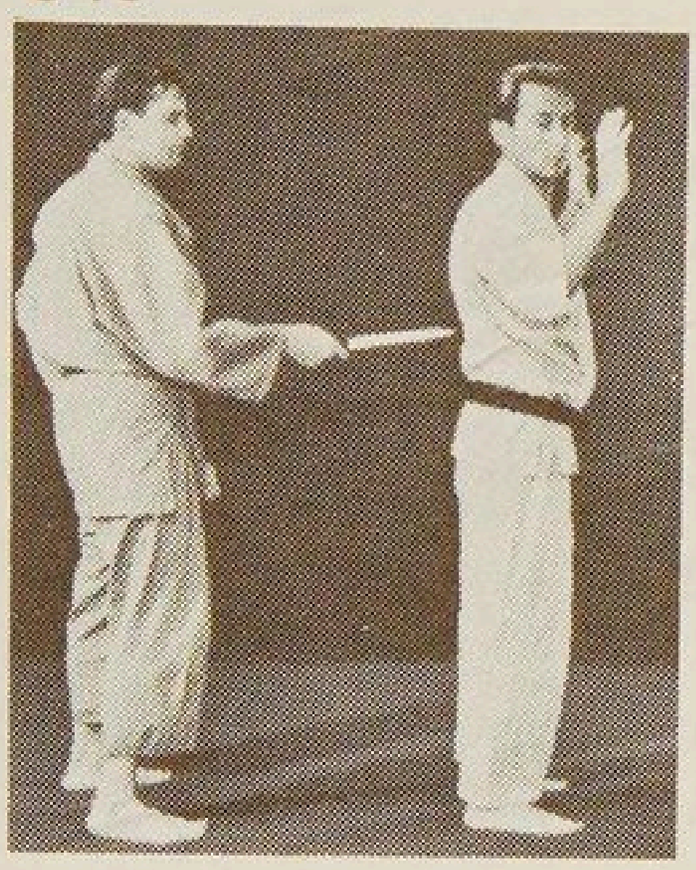
547



548

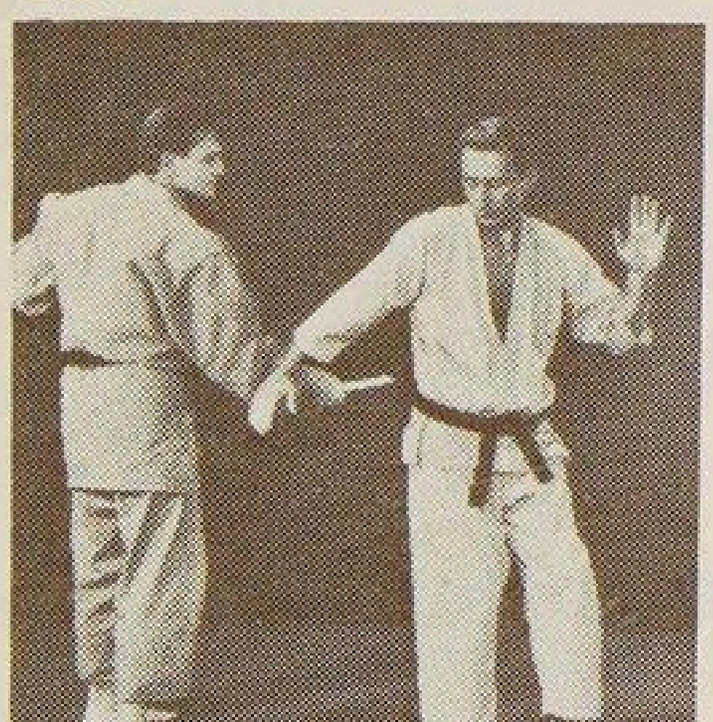


549

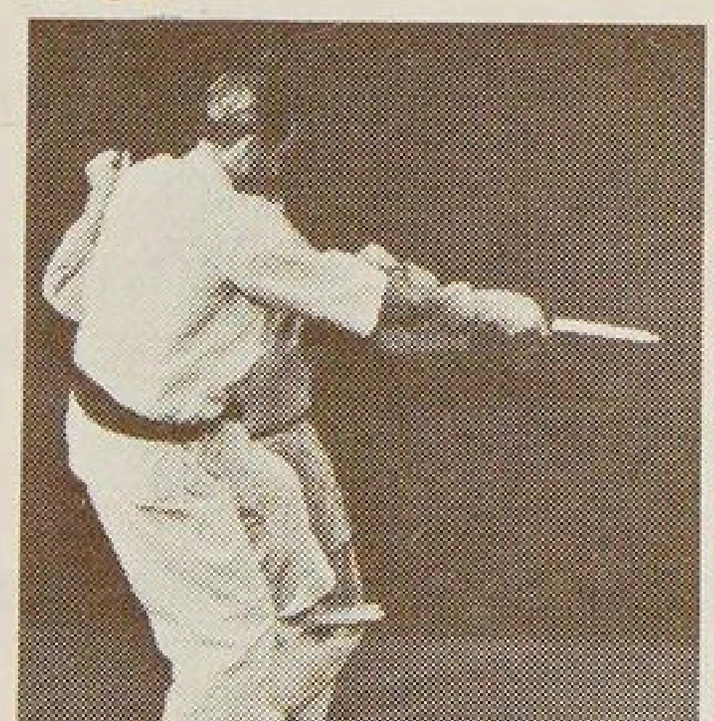


550

551

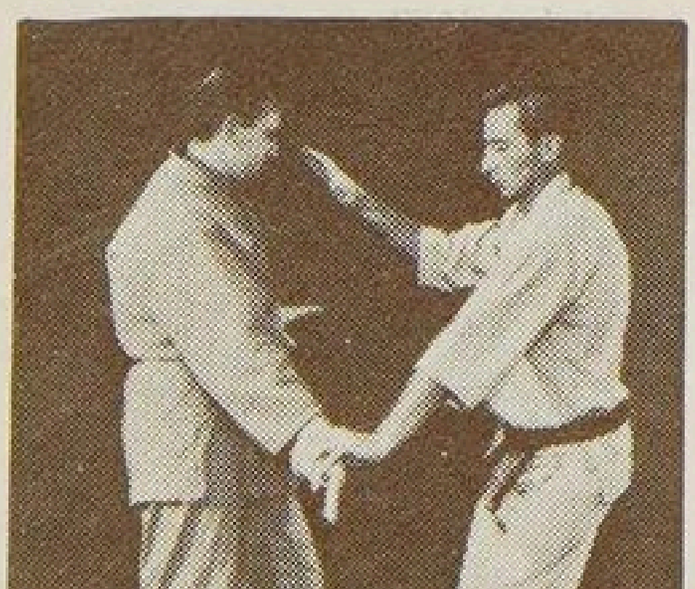


552



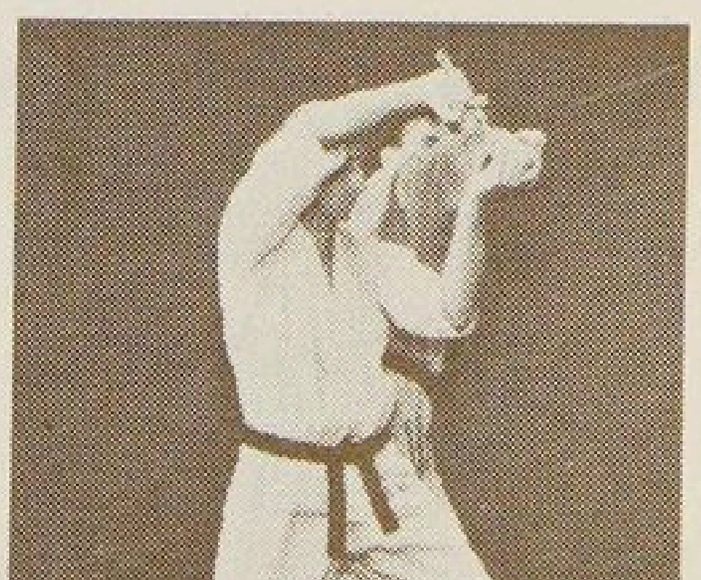
553

554



555

556



557. If necessary, you can use the gun as a striking weapon.

Gun Defense — Rear Threat, Arm Lever Ending

558. Right partner simulates threat of gun attack from the rear. Casually, glance about to see which hand holds the gun.

559. Distract to the opposite side of the gun hand with a subtle hand motion. (Following directions assume that the gun is held in right hand; most people are right-handed.)

560. Turning swiftly clockwise, slash at the wrist of his gun hand as you move your body out from the direction of the gun muzzle.

561. Continue your pivot to place yourself behind the adversary and strike into his throat with your left forearm; your right forearm has locked his gun arm at the wrist, pulling back sharply.

562. The two actions above should completely subdue him and allow you to take the gun away from him.

Gang Attack Defense — Assailants Front and Back

563. As the assailants move in or threaten attack, deliver simultaneous blows. Shown here are an elbow blow to the back assailant and a kick and stab to the front.

564. Reverse the blows, kicking to the rear and striking front.

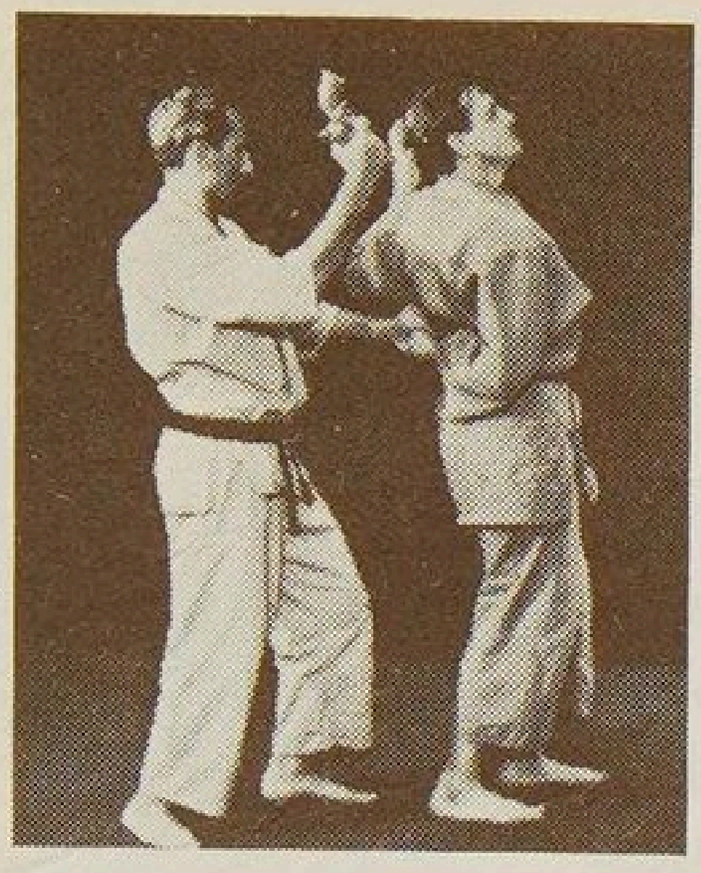
565. Repeat the above as needed; when one of the attackers is visibly hurt, move around in back of him and shove him into the other person.

566. Continue kicking and striking as required.

Gang Attack — Back to Wall

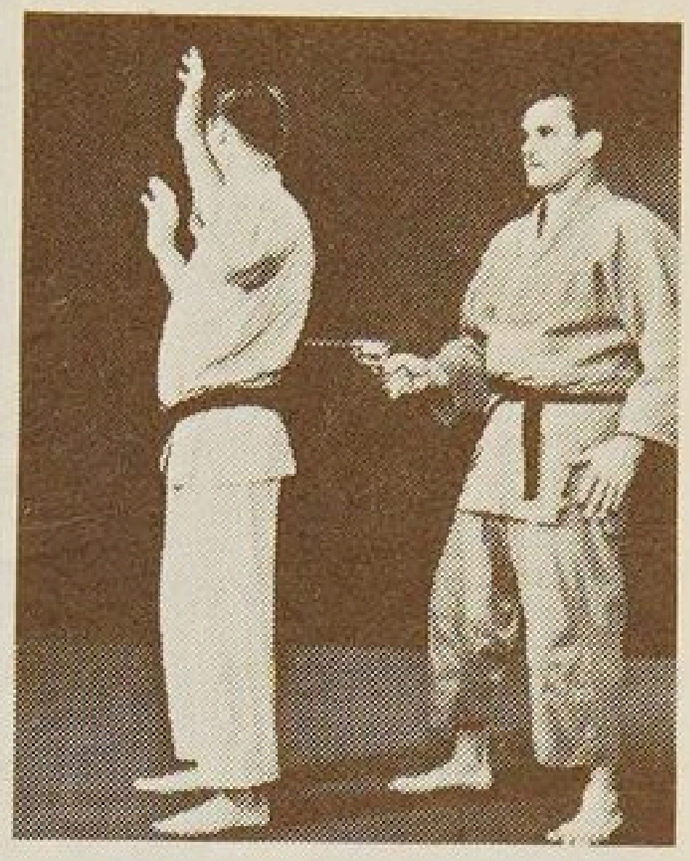
567, 568. From a completely cornered situation you are threatened by two attackers. As you kick into one opponent, both your arms should block their hitting arms; immediately kick the other opponent while you continue to block their arms with your forearms. Your main tactic is the kick.

557

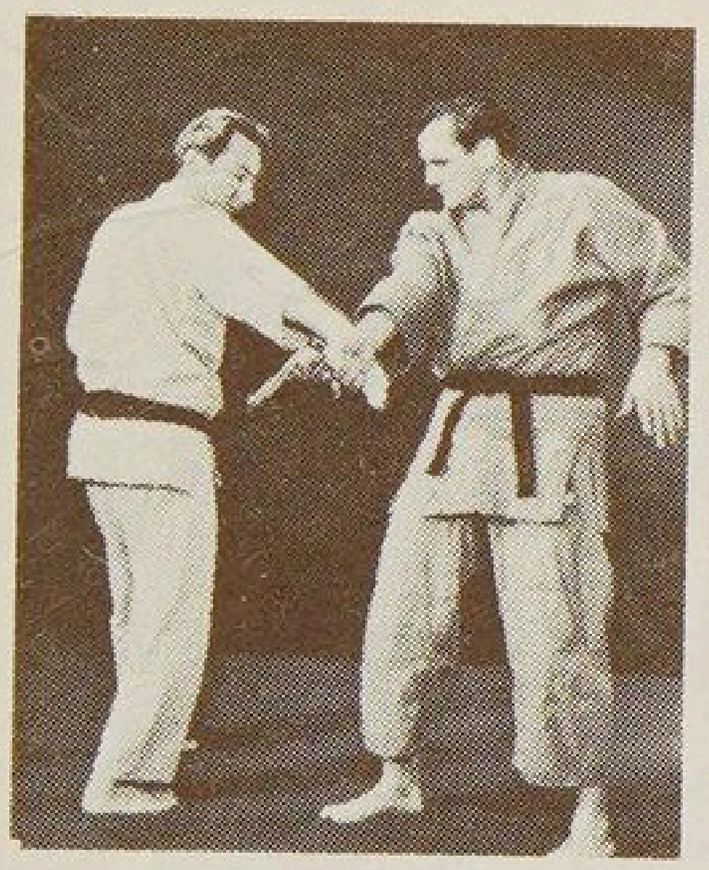


558

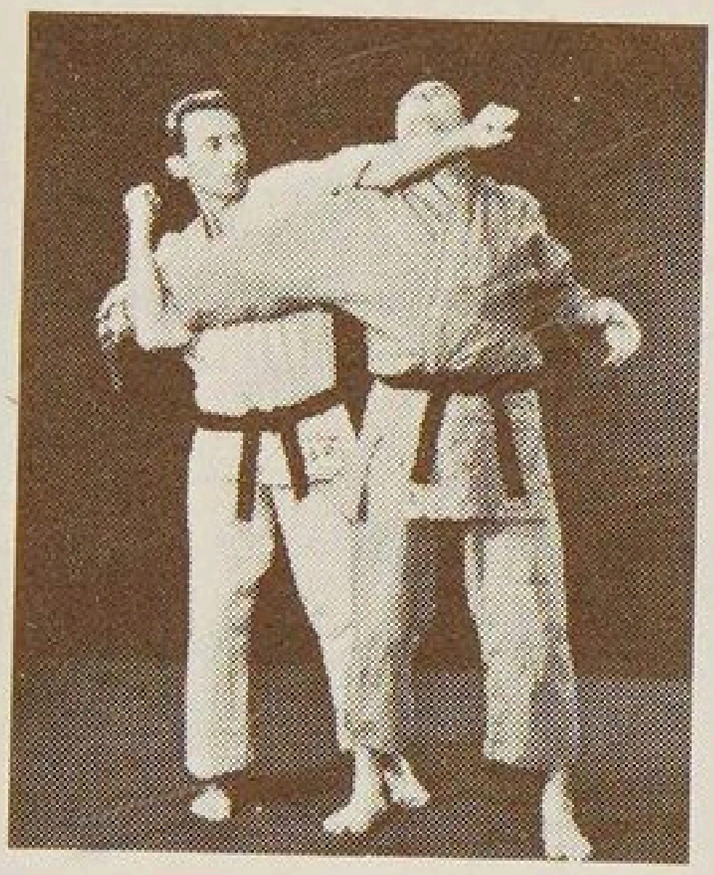
559



560

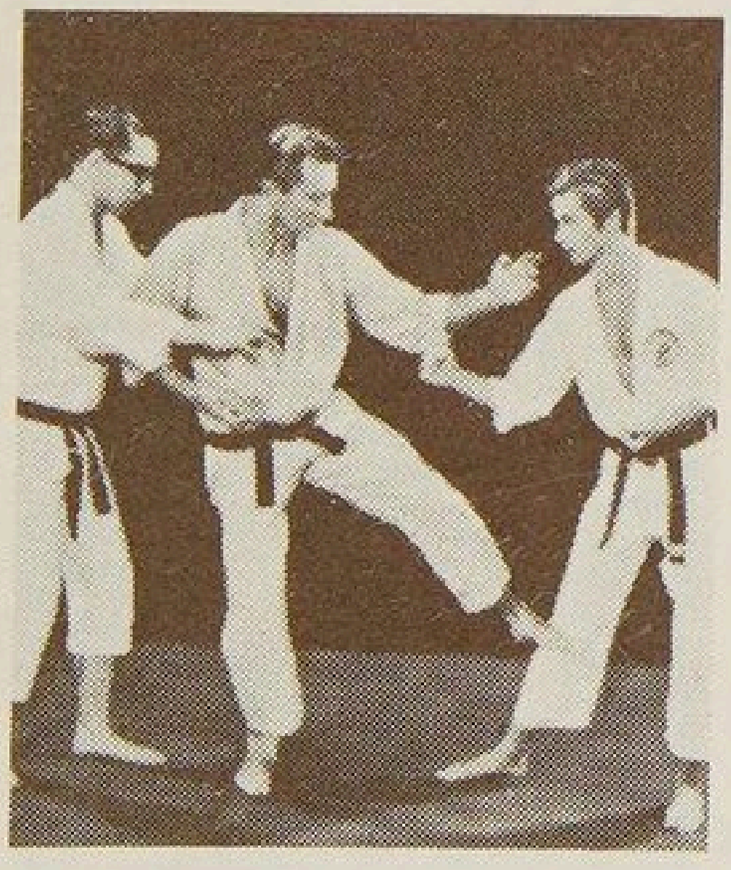


561



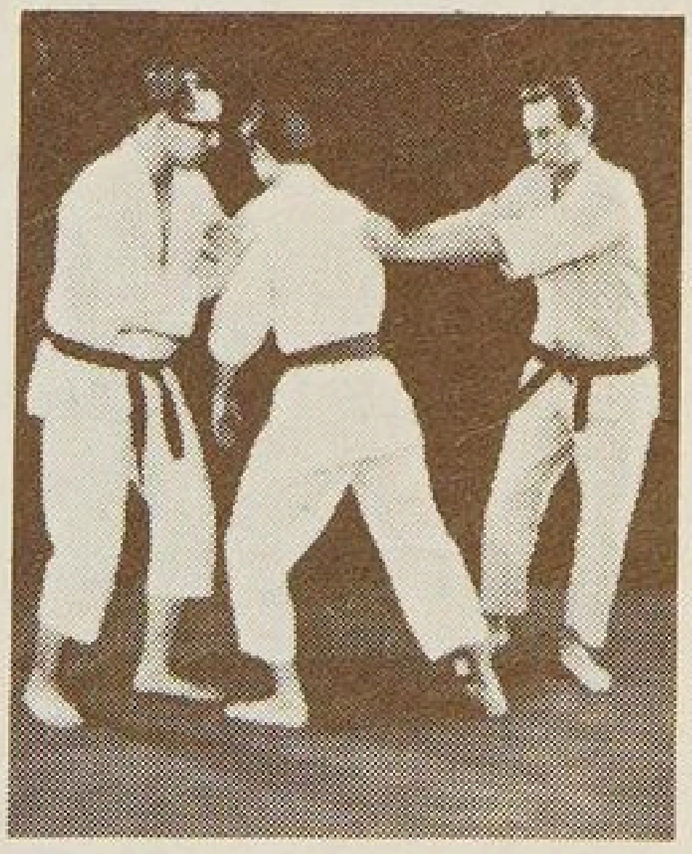
562

563

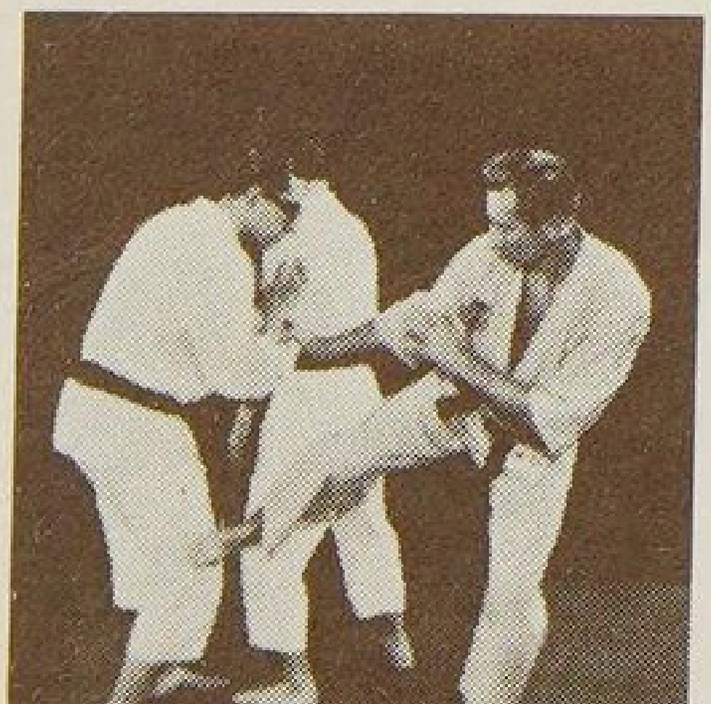


564

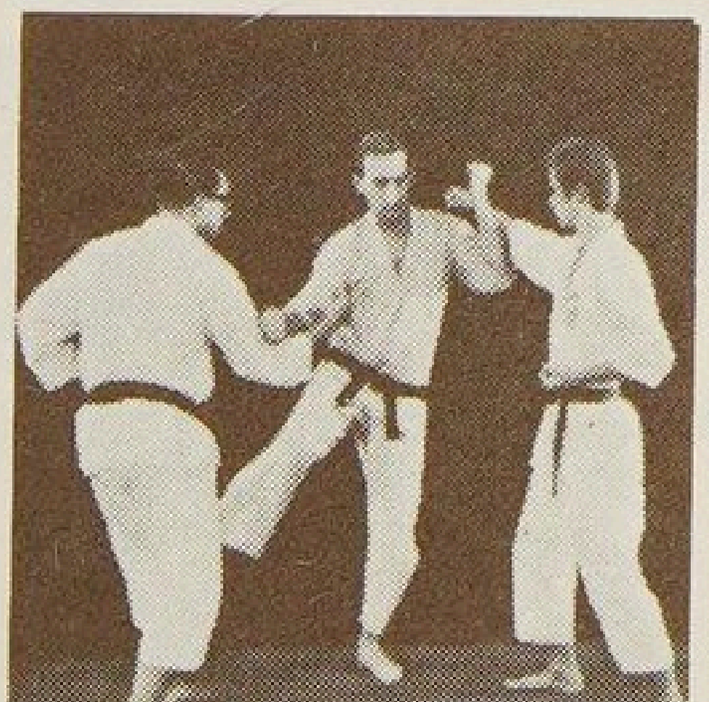
565



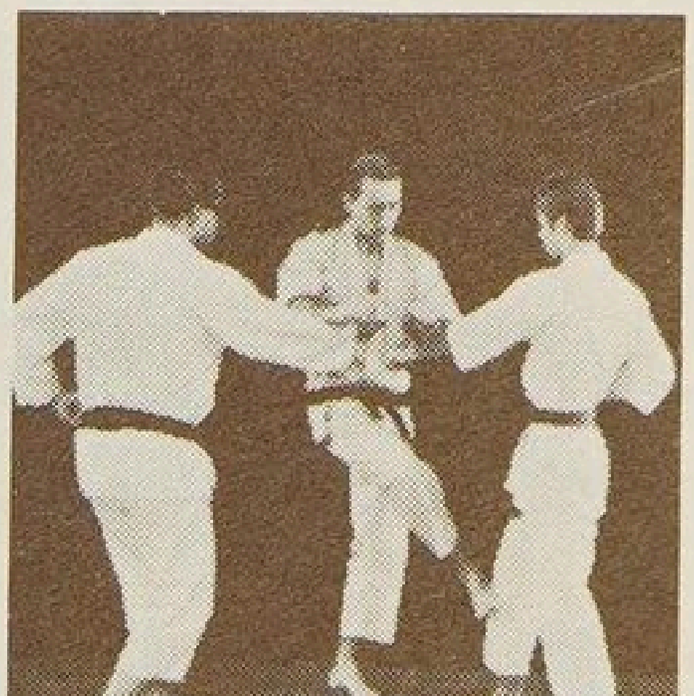
566



567



568



569, 570. Continue kicking until one assailant is visibly hurt, then move around behind him; shove him into the other man.

571. Carry on with kicks as needed.

CREATIVE ADAPTATION

The creative work for this rank requires five examples of original routines; each example to include: 1. Stopping the attack; 2. Application of lock, hold, or choke; 3. Use of judo throw (not a takedown); 4. Hold, lock, or choke on the ground.

The sample of creative work shown here for your guidance was developed by Don Phillips and was demonstrated by him during his test for advancement to this rank.

572, 573. Don Phillips, left, responds to threat of attack using a kick to the knee and slash to the arm.

574. He applies an under arm pin.

575, 576, 577. He pivots back into position for leg lifting throw and executes the throw.

578, 579. When his partner is on the ground, he hesitates just long enough to demonstrate that it was a clean, full throw, then drops down into position to apply the bent arm lock.

FREE-STYLE SPARRING

One or two minutes of free-style exchange of hand and foot blows against two opponents simultaneously.

DEMONSTRATION OF RESPONSE TO UNREHEARSED ATTACK

Five examples of response: two are unarmed attacks; three are weapon attacks.

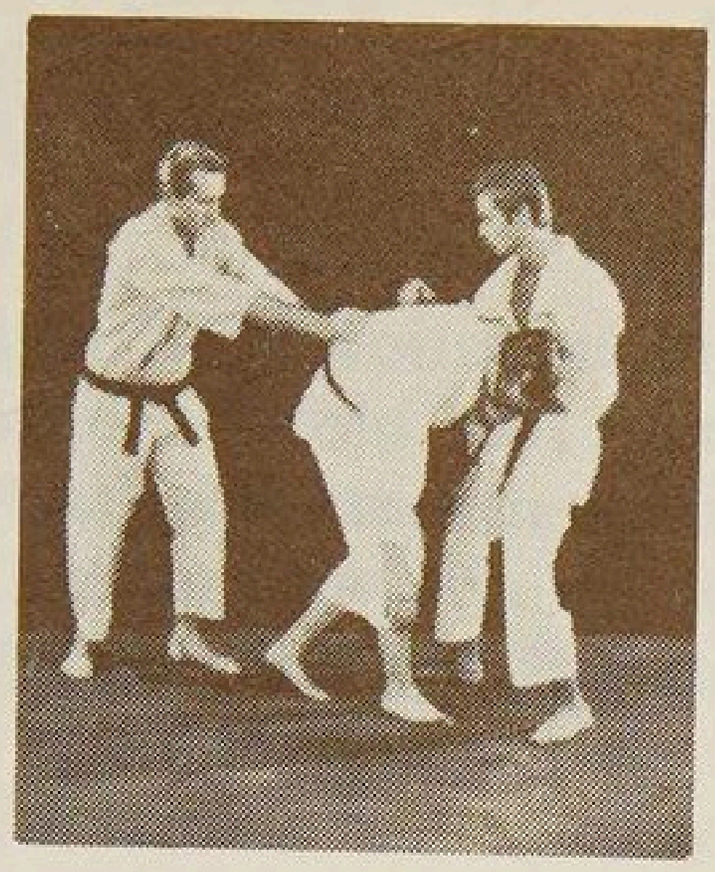
HOW TO TAKE THE TEST: BROWN RANK (Three Stripes)

This test must be given and graded by a person holding the rank of black belt, with a second person of black belt rank approving the advancement.

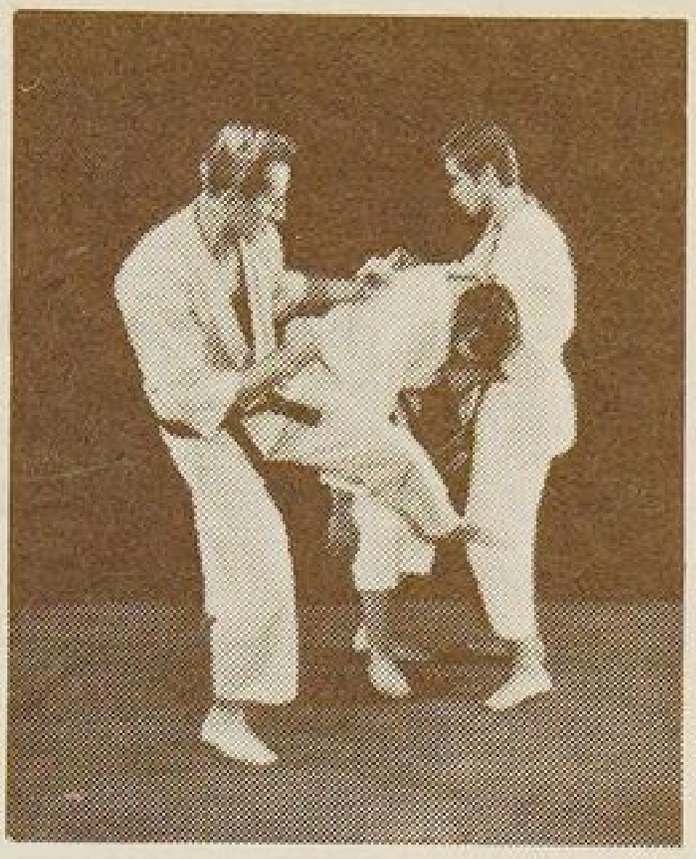
As in all previous tests, the student must show an increased ability to do the techniques. For advancement to this rank, a greater degree of creativity and inventiveness is expected, as well.

569

570



571



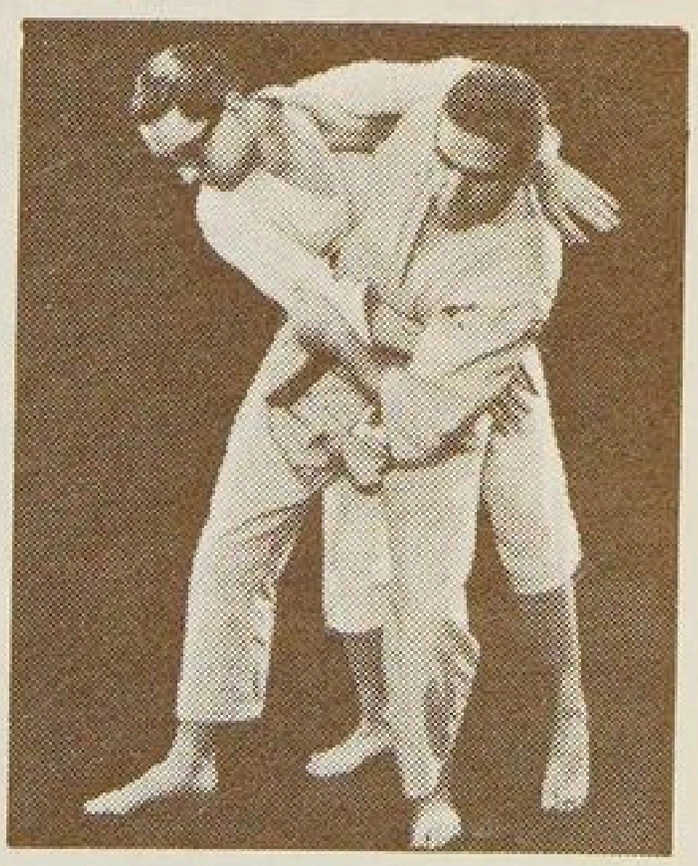
572

573

574

575

576



577

578

579

For the first time in the rank advancement tests, the student will be graded on receiving ability. Receiving must be better than acceptable, it must be excellent in form.

Sparring must be a demonstration of versatility. The student must use a variety of hand and foot blows. He must show the ability to move his attack and defense from opponent to opponent in a quick and varied sequence of actions without hesitation. The two other participants in this phase of the demonstration do not make contact and observe all safety rules, but try to test to the full the ability of the student making the demonstration.

Response to the unrehearsed attacks must be fast and appropriate. The partner simulating weapon attacks will use a stick to represent the weapon; *how* he makes the attack will be the clue indicating which weapon he is using.

THROWS

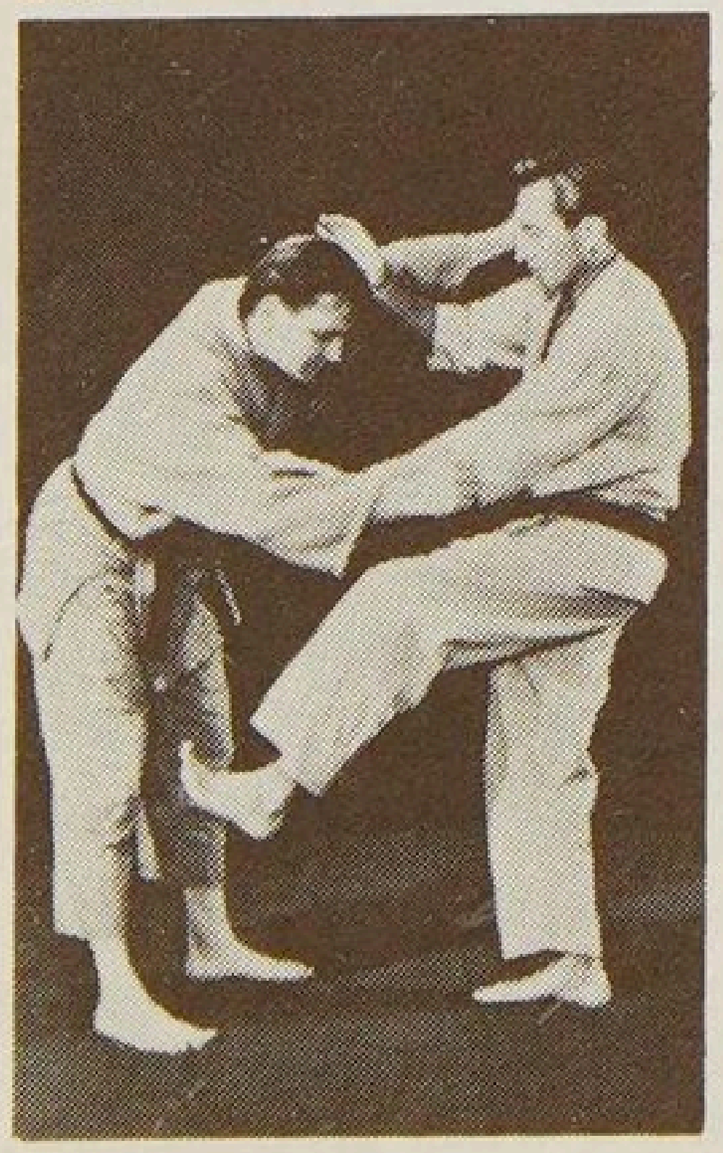
Pulling Down Straight Foot Throw

580. Pre-throwing action breaks left partner's balance well forward, putting him into position for this throw. Or if you are being pushed or thrust into backward off-balance, the choice of a sacrifice throw is sensible.

581. Using his forward motion to assist, and holding onto him to ease your downward action, place your left knee toward his left side.

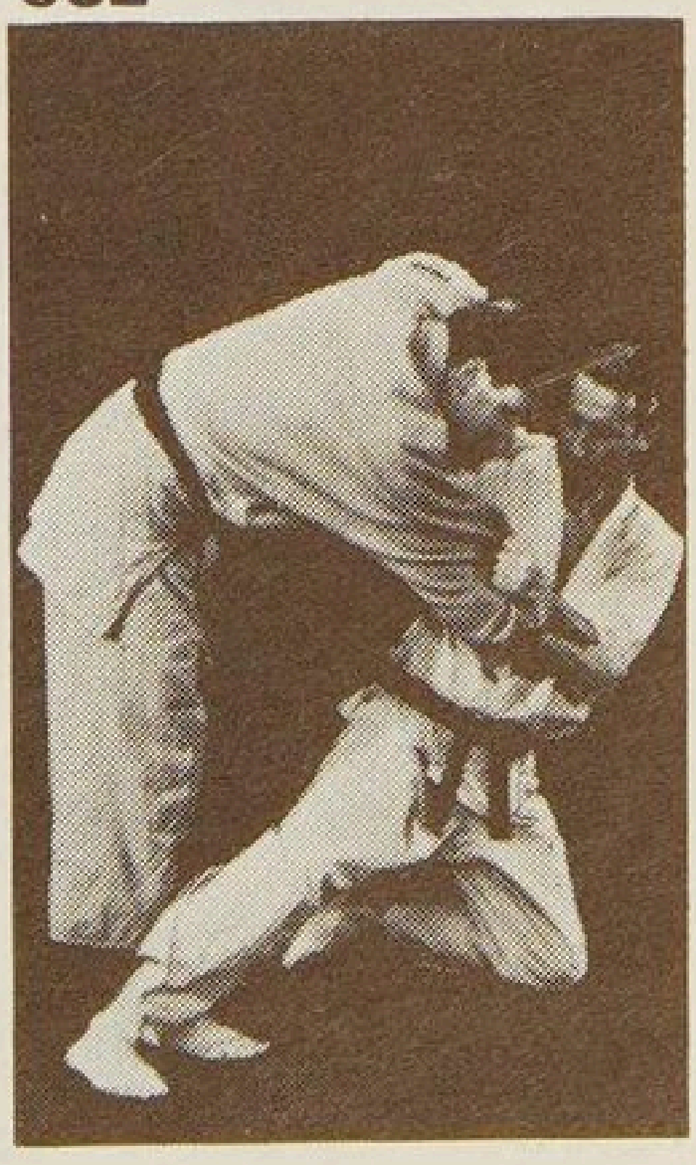
582. Extend your right leg, locking your right ankle into his right ankle, continuing the pulling action with your arms.

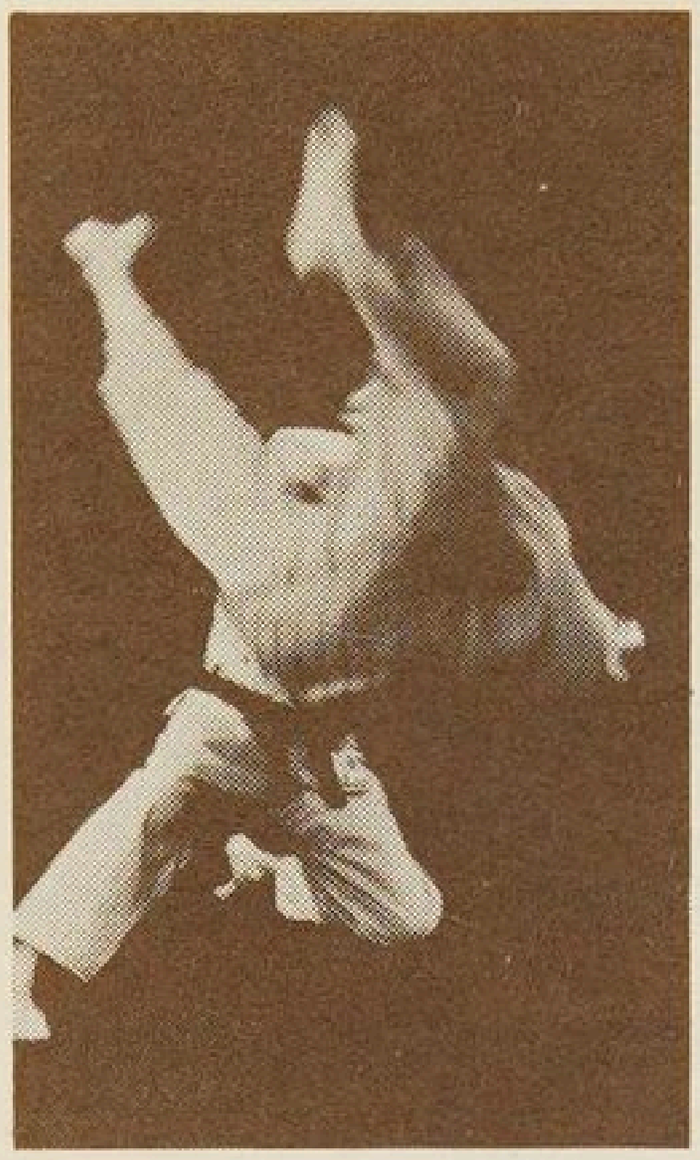
580



581

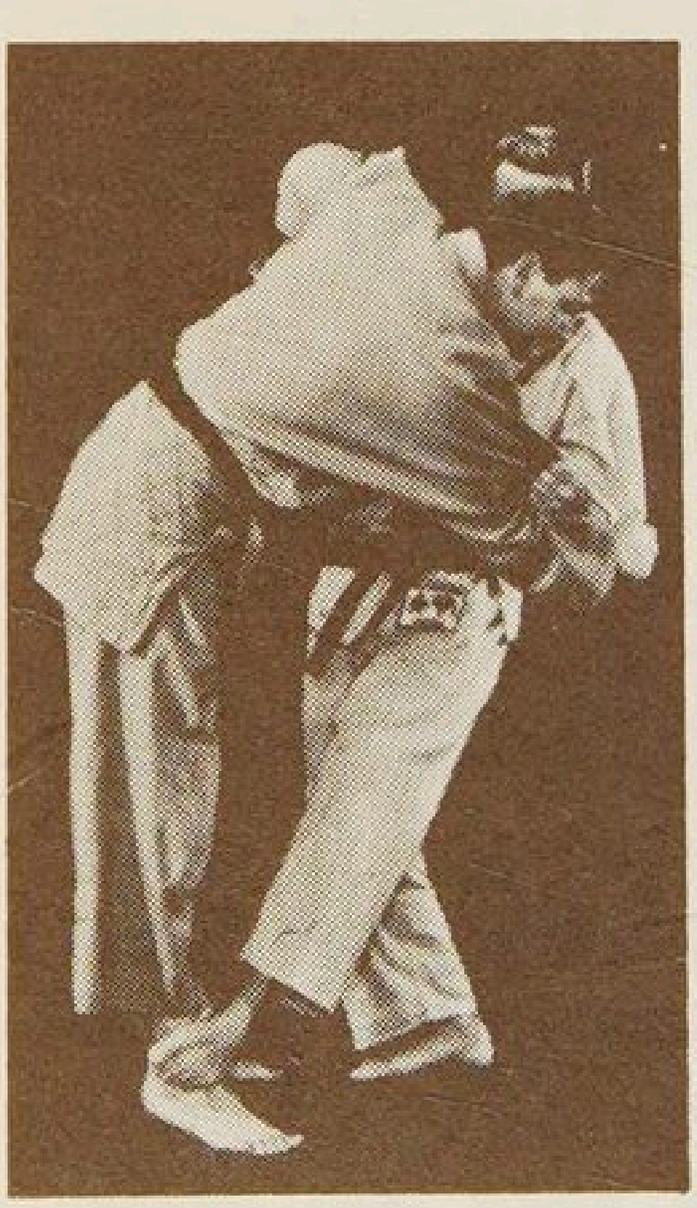
582





583

584



585

586

583. Complete the throw by pulling him sharply into your chest and then down and around to your left side.

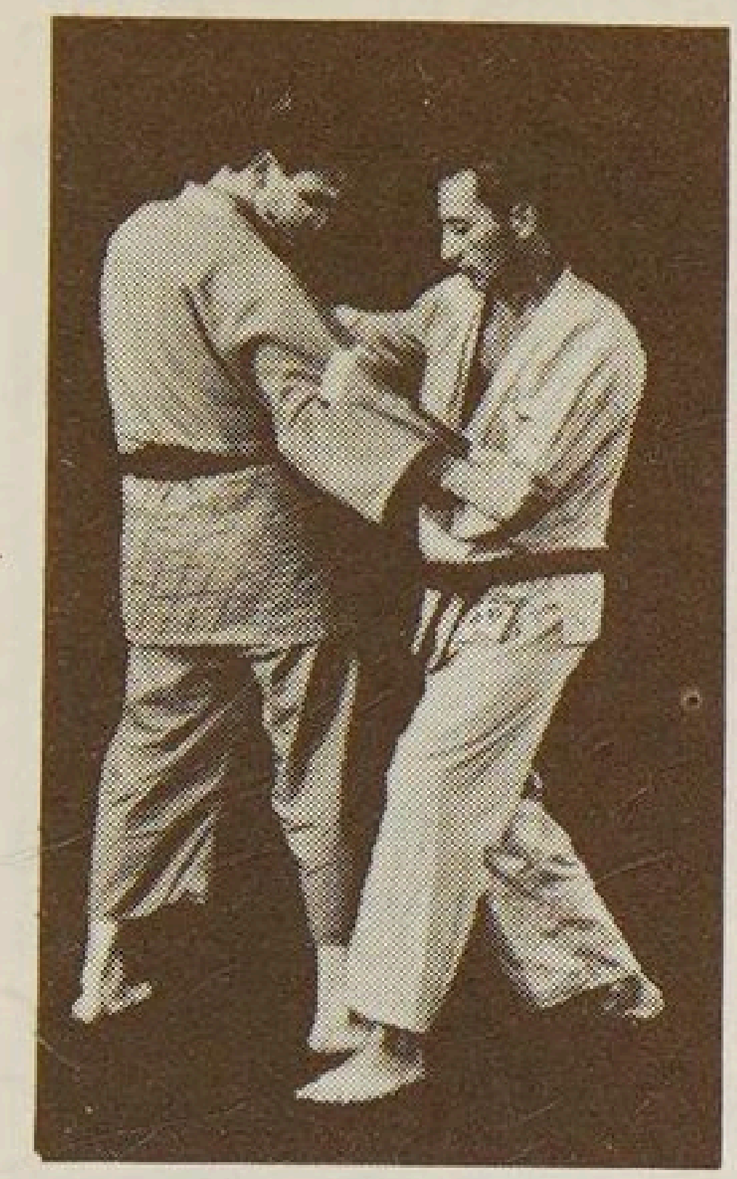
Lifting Sweeping Foot Throw

584. Pre-throwing action will weaken your opponent and allow you to maneuver him into awkward off-balance position.

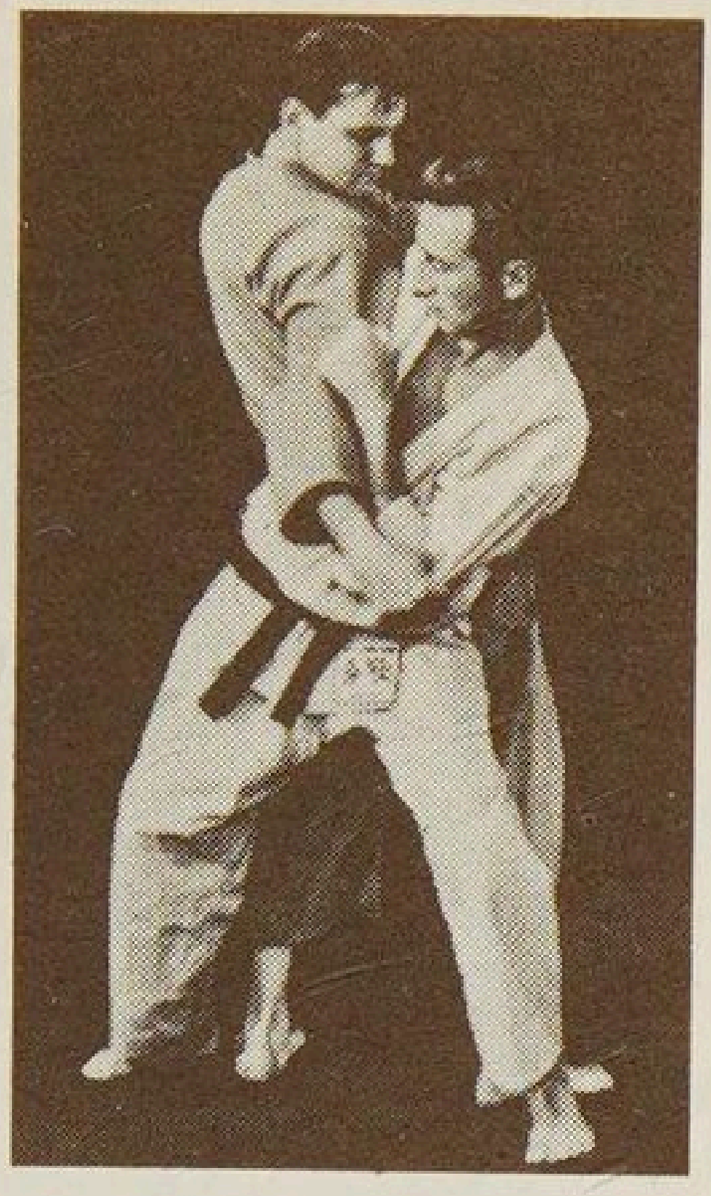
585. Rock his weight forward and to your right so that his left foot is weakly set on the mat; with your arms pull him into your chest, as you sidestep to his left and place your left foot at his right ankle.

586. Complete the throw by sweeping his right foot with a lifting swinging action as you pull around and down with your arms.

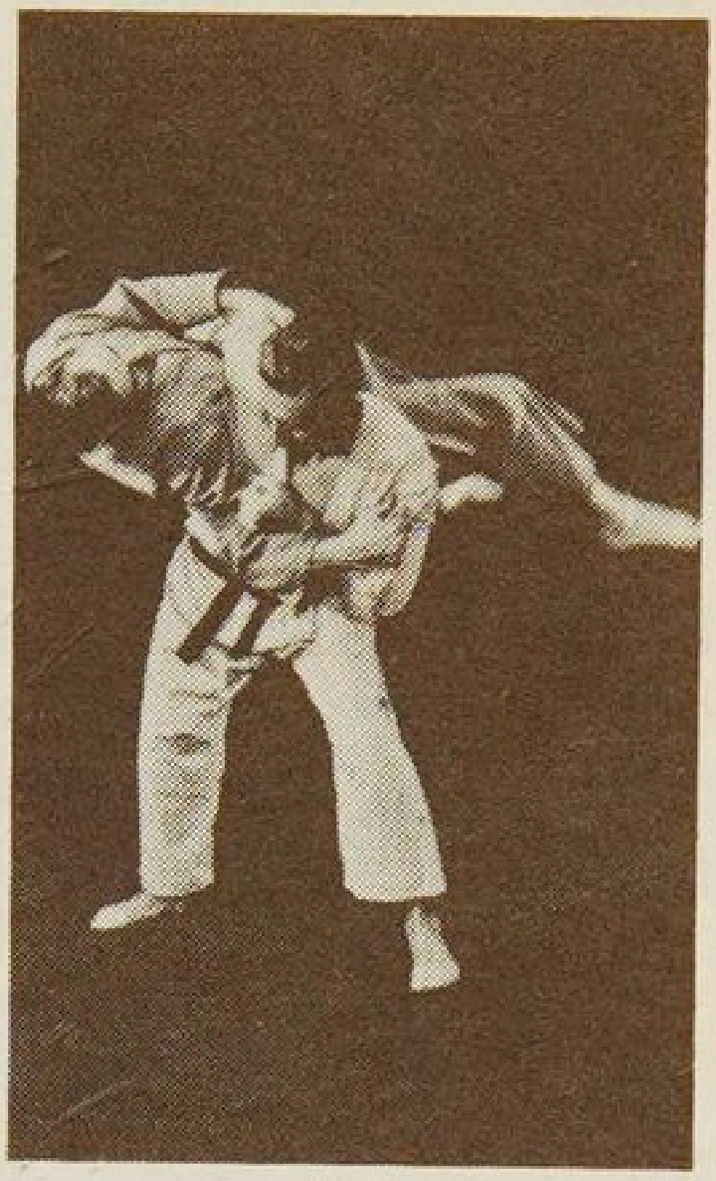
587



588



589



Rear Hip Throw

587. After the usual pre-throwing action, take a deep step forward with your left foot to his right side, as shown.

588. Take another deep step forward so that your right foot is directly behind his left foot; maintaining standard throwing grip, place your right hip against his right hip and begin pulling him back.

589. Topple him over backward as you twist around and down with your arms. Avoid the error of pulling him around your leg; he actually goes over your hip when the throw is done correctly.

DEFENSES AGAINST ATTACKS

When to Assume the Offensive: Close-In

As an advanced student of self-defense, you are expected to use your judgment *and* your training in such a way that you avoid fighting whenever possible, but do not run the risk of being hit first if a fight is unavoidable. Because street fighters can be very fast and are often capable of delivering a one-punch blow that could knock you out, you cannot afford to let even one punch reach you. Even a blow which does not knock you out could hurt or disorient you, making effective defense difficult. The "offensive" in this case is actually a defense because of the situation. No matter who strikes out first, the aggressor is the one who insists on fighting. If you have done everything in your power to persuade the opponent that you don't want to fight, if you have done nothing to encourage him to think that you intend to fight, then you are absolutely justified in going into action before he lands a blow. The response shown here is versatile and offers good guard as well as the advantage of double action blows.

590. Faced with an adversary (left) who threatens or insists on a fight, first try to dissuade him.

591. At the first sign of physical action, draw one leg up and across your body to protect your groin and prepare to kick; draw one hand in a high guard to protect your face and throat, the other hand in middle guard . . .

592. . . . and, without hesitation, kick into the knee as you strike out with your favorite hand blow. Follow up with hand and foot blows as needed, working your way behind him when you can; takedown if necessary.

593, 594. The advantage of the above technique is that it will stop a fist attack as you retaliate with the kick, or, if he kicks, it would block the kick as you retaliate with a hand blow.

For the test, it is enough to demonstrate the action as shown in the photos; in actual self-defense, you would carry on the defense as needed.

When to Take the Offensive — Distance

Though the use of this technique is limited, it is required of advanced students. Again, you must use your good judgment to determine when you should make a strong attack on an adversary who is out of hitting range. Examples would be: an adversary who is obviously closing in on you for attack, more than one assailant, or if he seems to be reaching for a weapon.

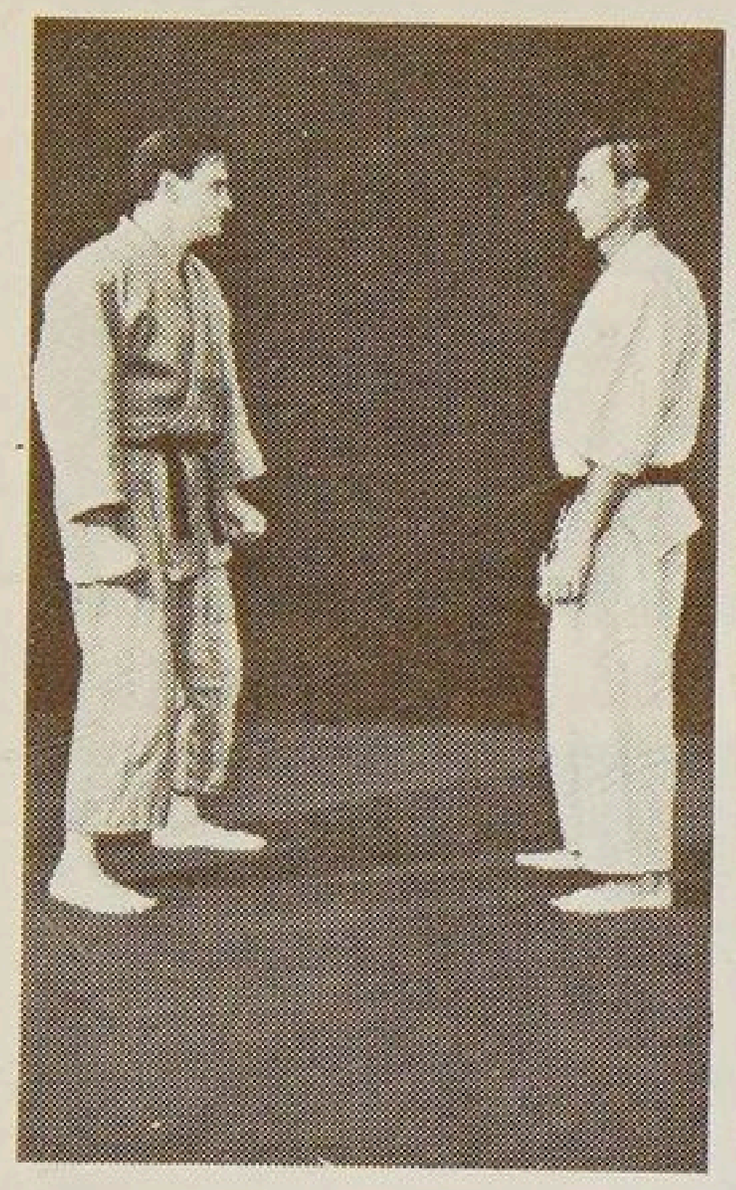
For the test demonstration, the simulated threat of attack is made from 12 feet away.

595. As left partner threatens attack, take one long step to gain momentum and deliver a high, leaping kick. For the test, and for training purposes, the high kick is required; in actual street use it is wiser to cover as much distance as needed without height. It is easier to recover from a middle or low area kick and very few students, even well-trained people, can maintain high kicking ability unless they continue to practice all the time. Low kicking is available to you even when you are not in top training condition.

596. As you drop down with both feet under you, deliver simultaneous hand and foot blows without hesitation. Repeat as needed. Then work your way around behind him for a takedown.

The takedown is not required for the test.

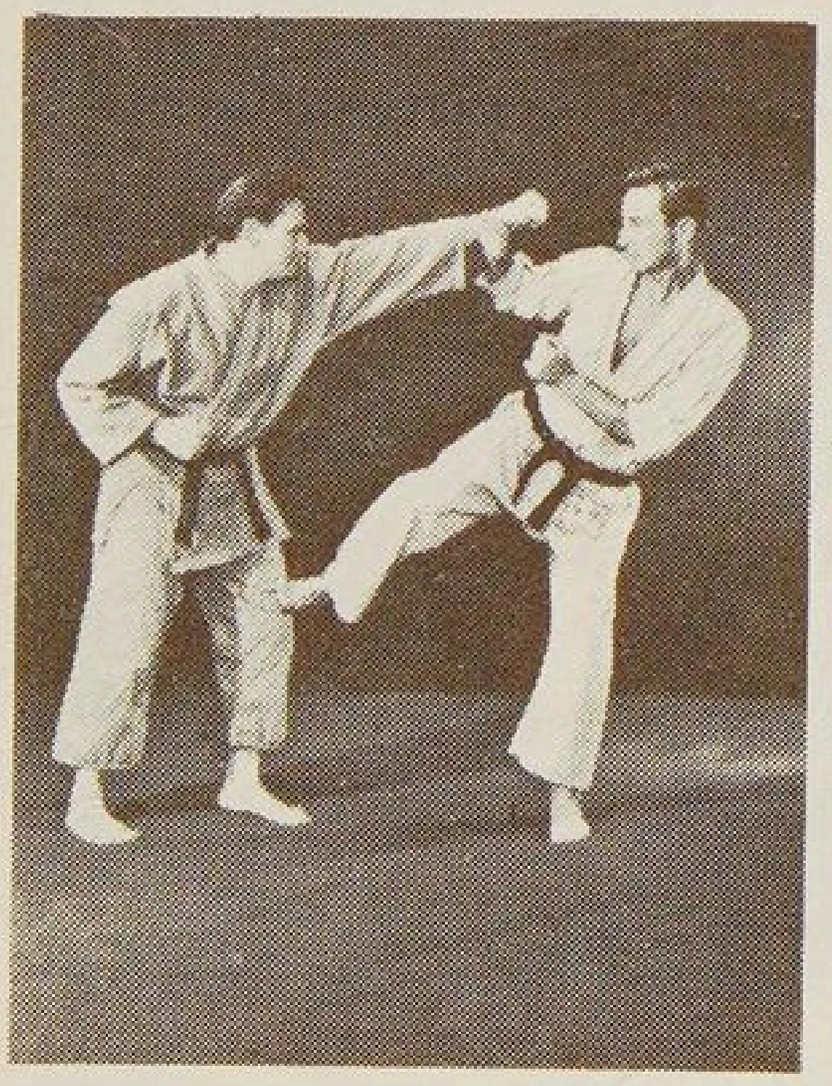
590



591

592

593



594

595

596

Defense from the Ground

There are times when you might need to defend from the ground. If you have been knocked down or you trip or fall, you need not be vulnerable to further attack. Because street fighters have no qualms about kicking a man when he is down, you should be prepared for this situation.

597, 598. Use your hands to move your body about, do not let your head touch the ground. The first action is to keep your head away from your assailant; pivot on your hips and swing around so that your feet are toward him; deliver forceful kicks into his legs. If he moves around to try to get at your head, move around to keep him at your feet.

599. When you have hurt him, or if he moves in very close, roll onto your side, hook the lower leg behind his ankle and kick at his knee with the other foot.

600. For the test, you pull with your lower leg and push with your other foot, lowering him to the mat gently.

601, 602. As soon as he is on the ground, rise and prepare to retaliate if necessary.

Sometimes, the first kicking actions will drive him far enough away to permit you to rise to your feet in safety.

In the test demonstration, the takedown is required; as soon as he is on the ground, rise quickly into strong balanced position.

Preventing Weapon Attack

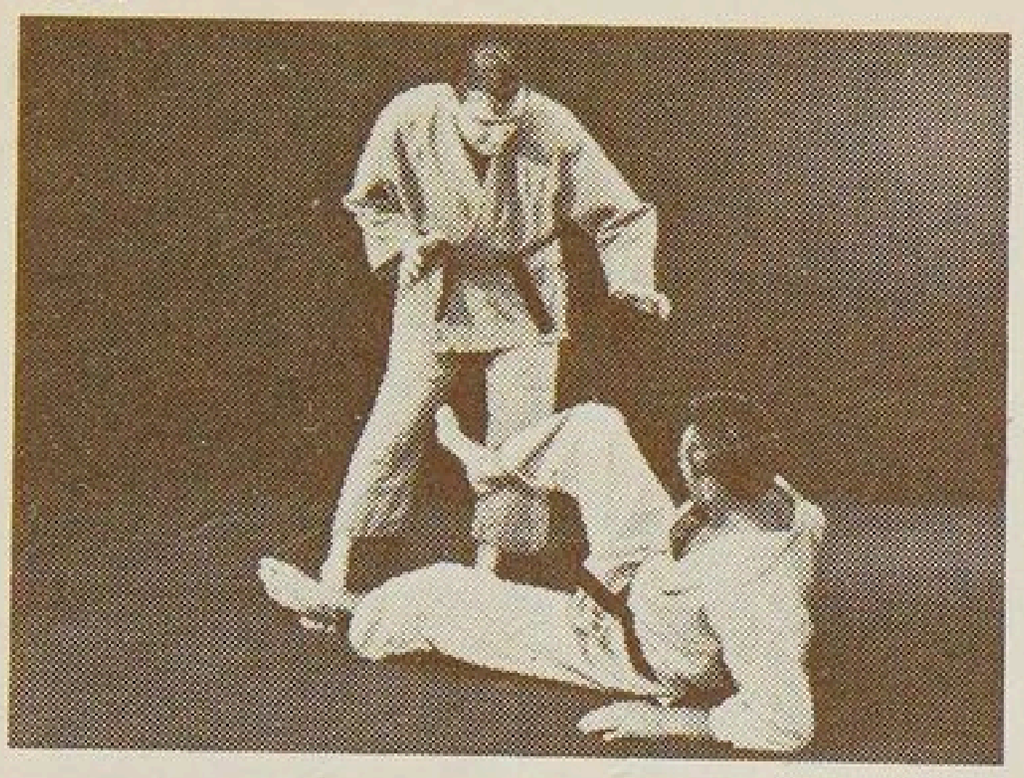
Statistically, there are very few unprovoked surprise weapon attacks. We read about them in the newspapers exactly for that reason — they are rare and unusual occurrences. Most attacks with weapons, especially gun attacks, are in situations where there is ample warning. In this situation, you are certain that the assailant intends to use the weapon, not merely show it for the purpose of robbery. For the test, the partner simulating the attacker uses a stick to represent knife or gun.

603. As left partner reaches to his right side with his right hand, you slash at his reaching arm with both your hands . . .

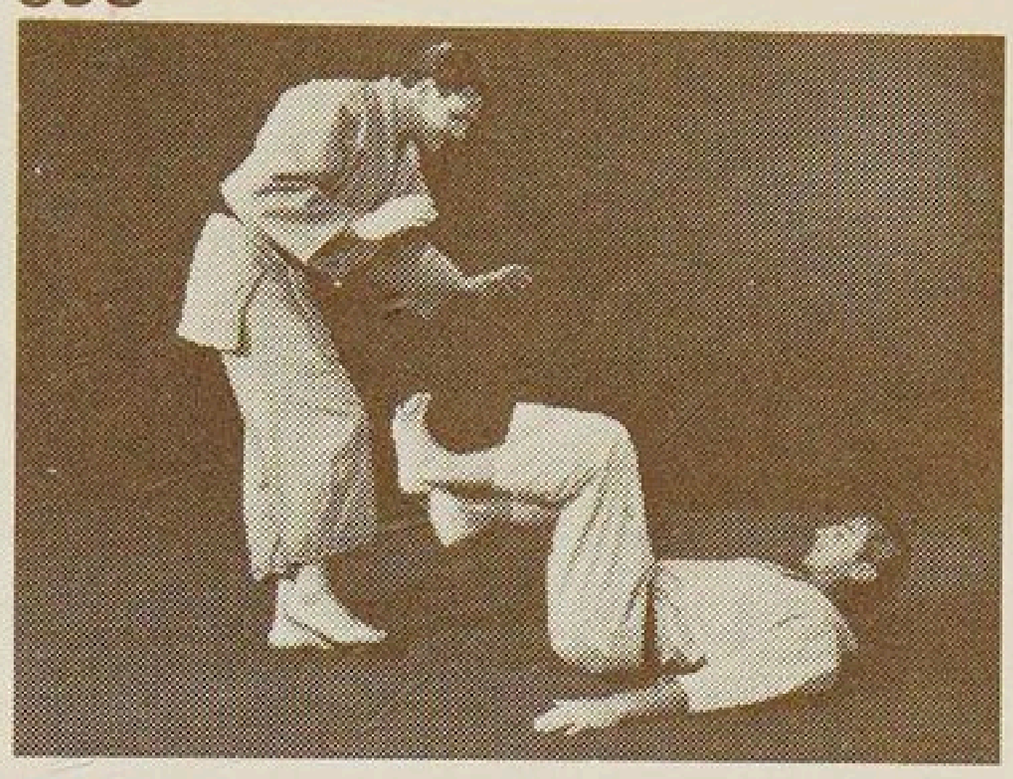
604. . . . and, without hesitation, pin his reaching hand at the forearm as you kick and hit.

605. The same procedure is used when he reaches cross-body.

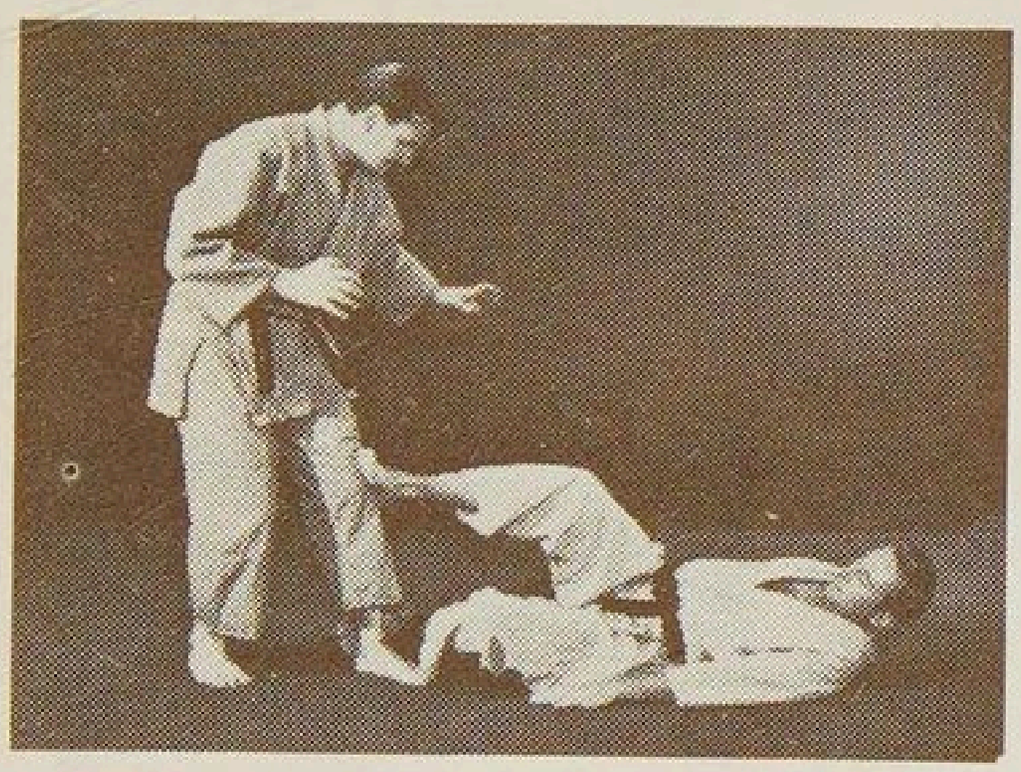
597



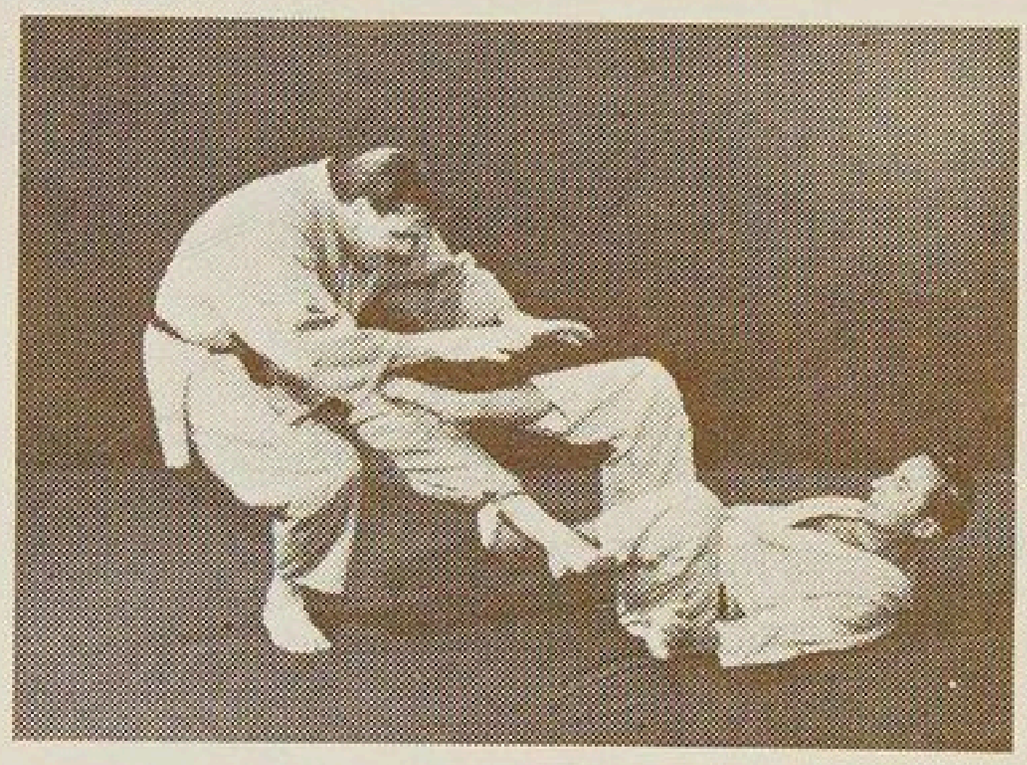
598



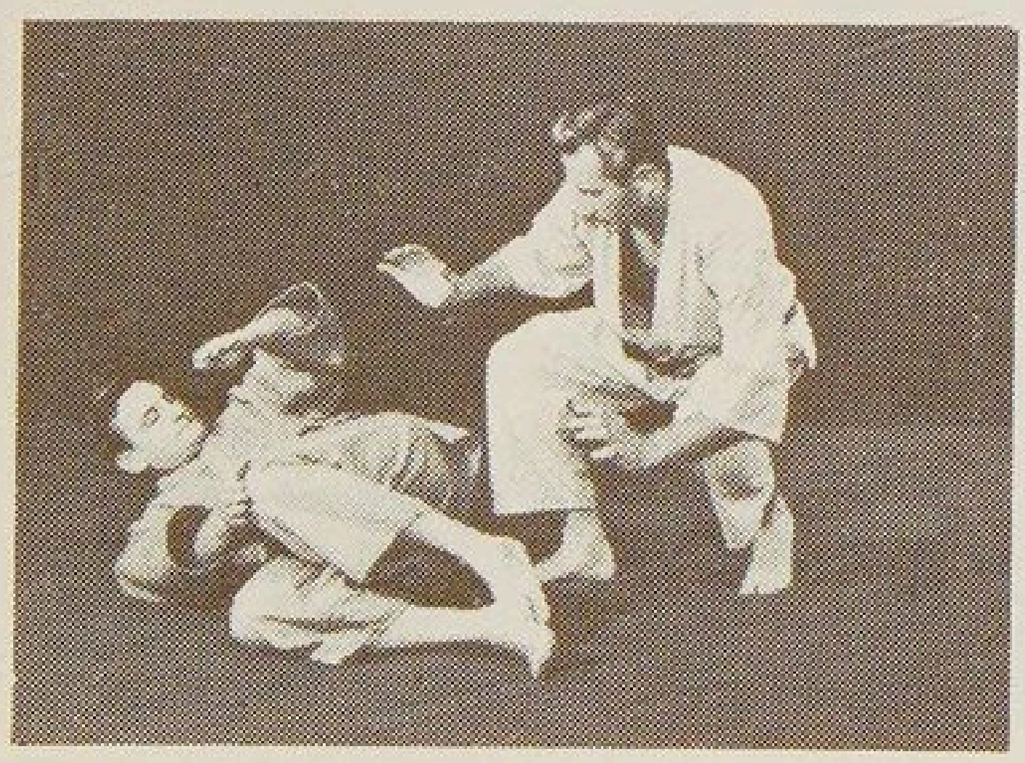
599



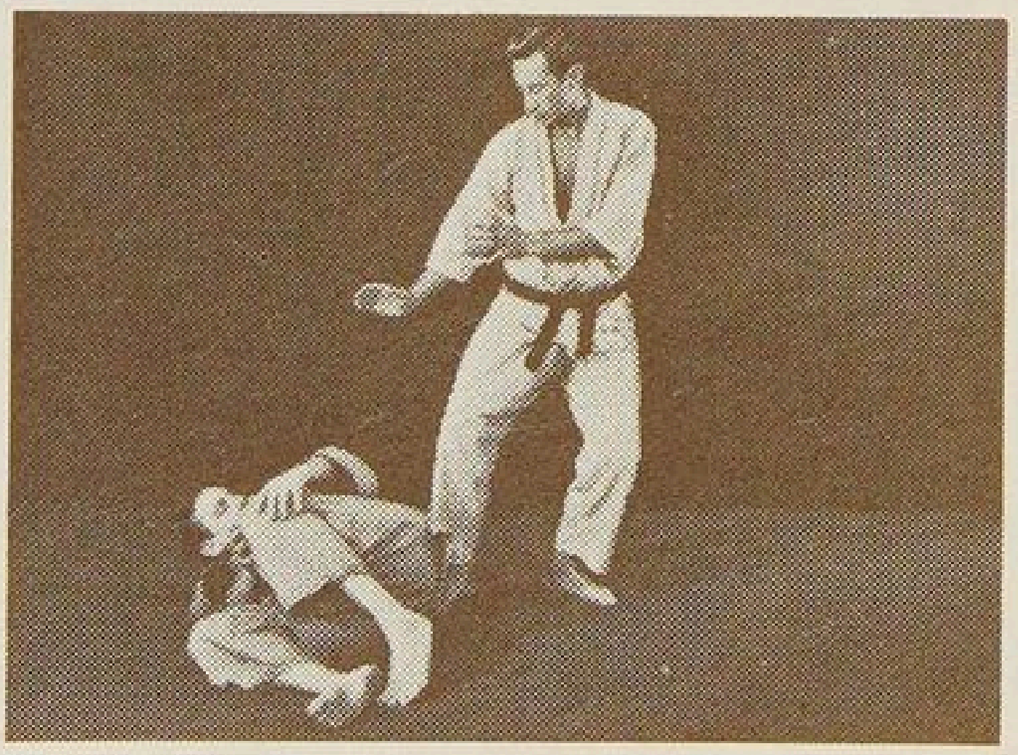
600



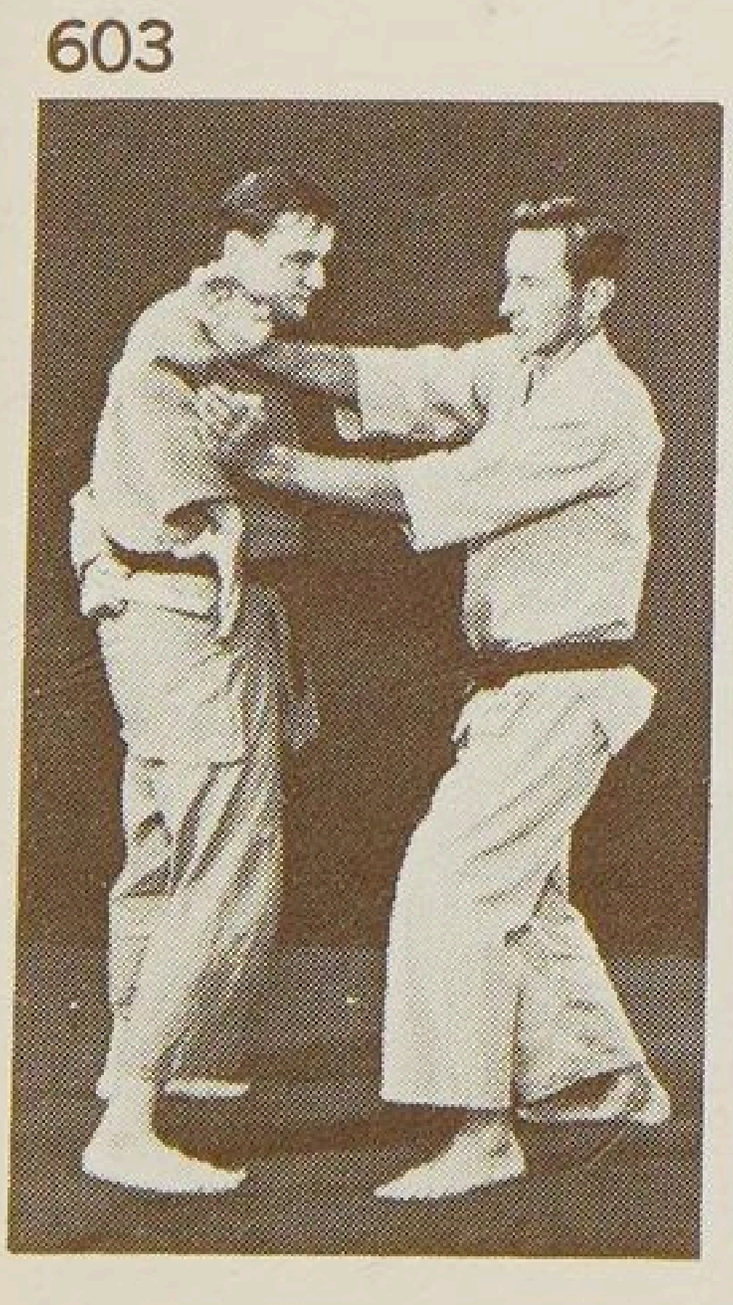
601



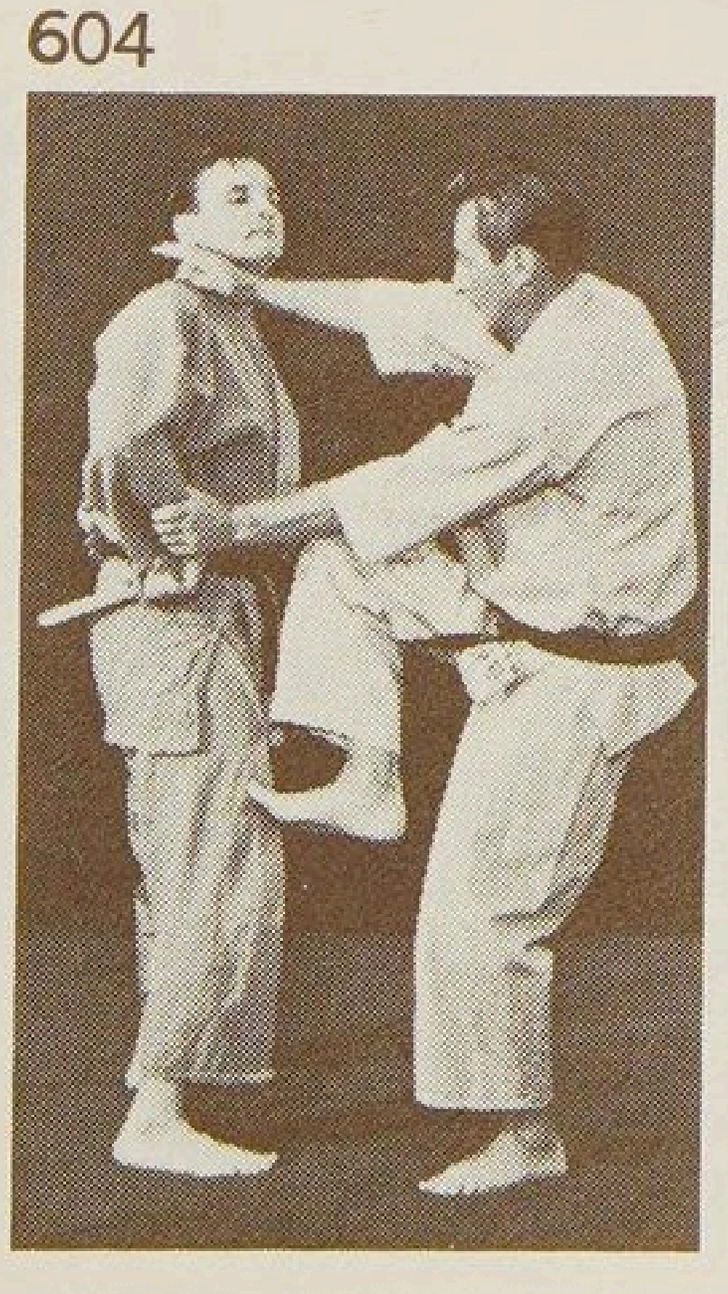
602



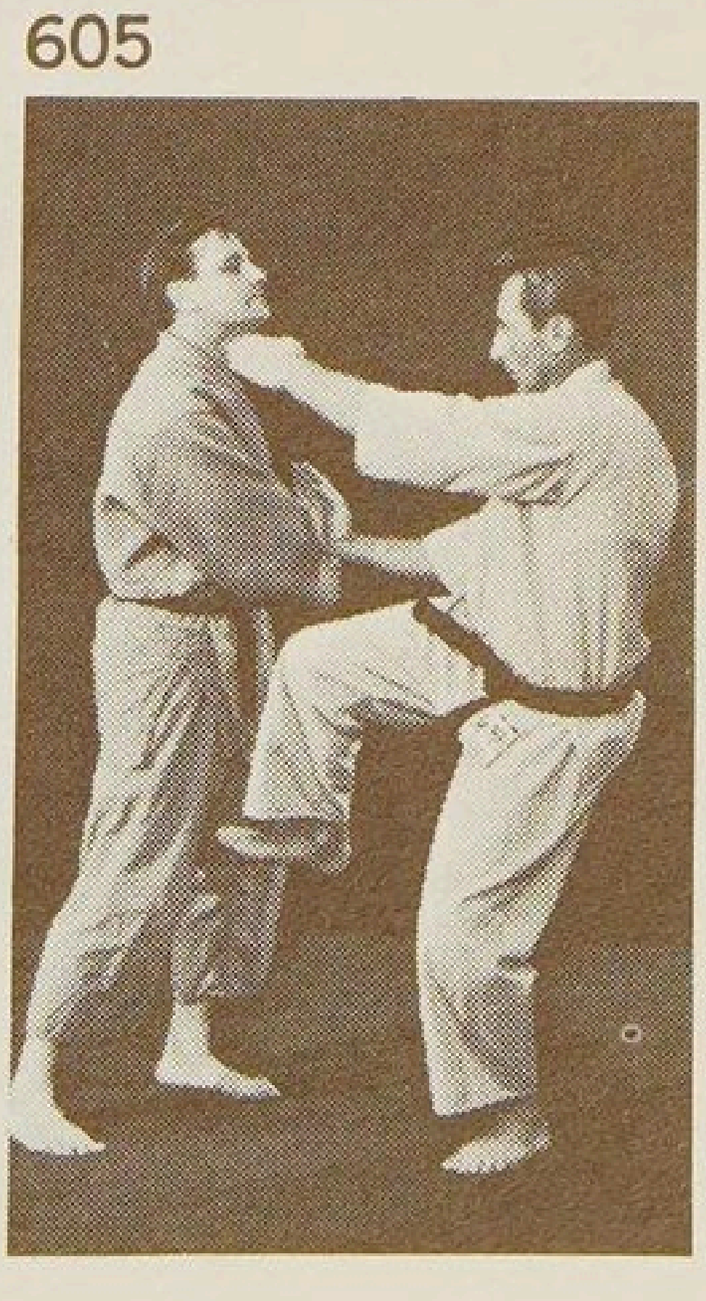
603



604



605



606. The same general procedure is used if he reaches out as to a table or counter.

After stopping his intended attack, continue kicking and hitting; when he is weakened, disarm him.

The test demonstration requires only that you apply your defense to the point of immobilizing the weapon arm.

Long Stick Defense

607. Left partner simulates attack with cane (or umbrella or long stick). As his arm moves forward, take a long leap back out of range.

608. Allow the weapon to go past you and then, without hesitation, leap back into kicking range and kick as you leap.

609. Immobilize his weapon arm and continue kicking until he is subdued.

For the test, demonstrate the defense to the point of immobilizing the weapon arm.

Knife Defense — Cornered, Close

610. You are cornered and partner simulates very close-in threat of knife attack, making a short, thrusting, low stab from the side. Move your hip away from the knife thrust as you slash at the knife arm and stab into his eyes.

611. Continue stabbing blows into throat or eyes and kick into knee or shin. Continue as necessary until he is weakened.

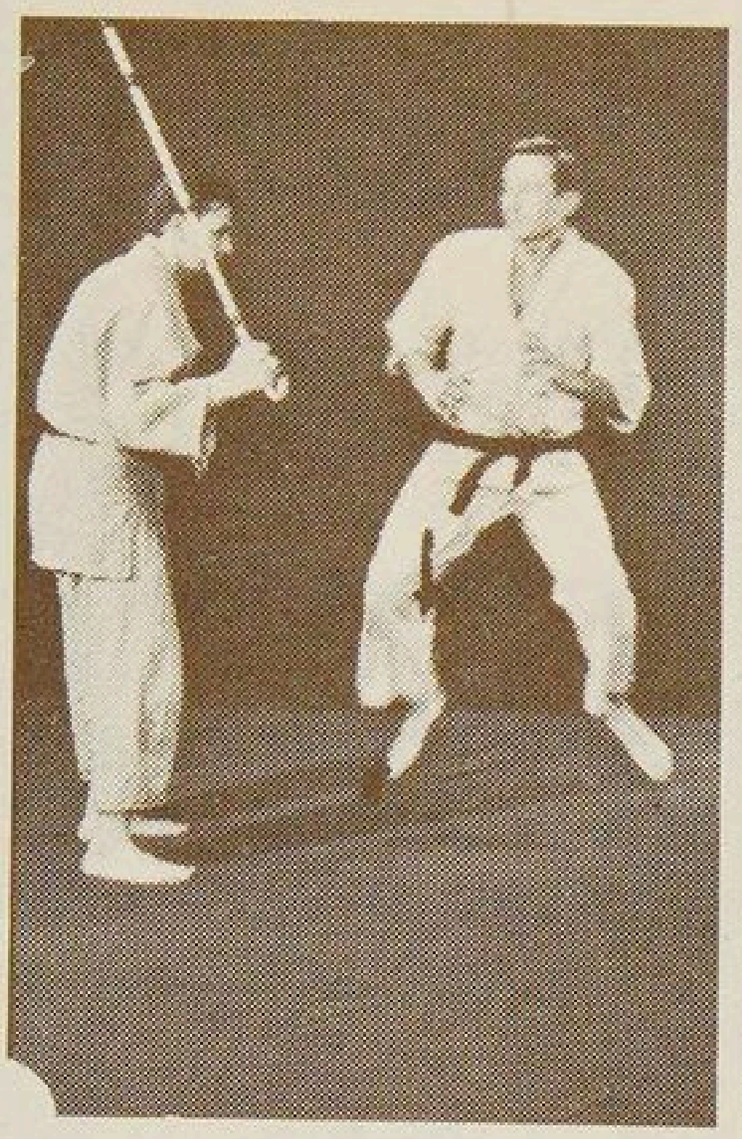
612. Moving away from the weapon side, get around behind your assailant and immobilize his arms as you continue to kick until he is subdued or injured.

613. Attack is made from overhead; you move your head out of the direction of the knife thrust as you slash his knife arm with one hand and stab into his eyes with the other. Follow-up action as before.

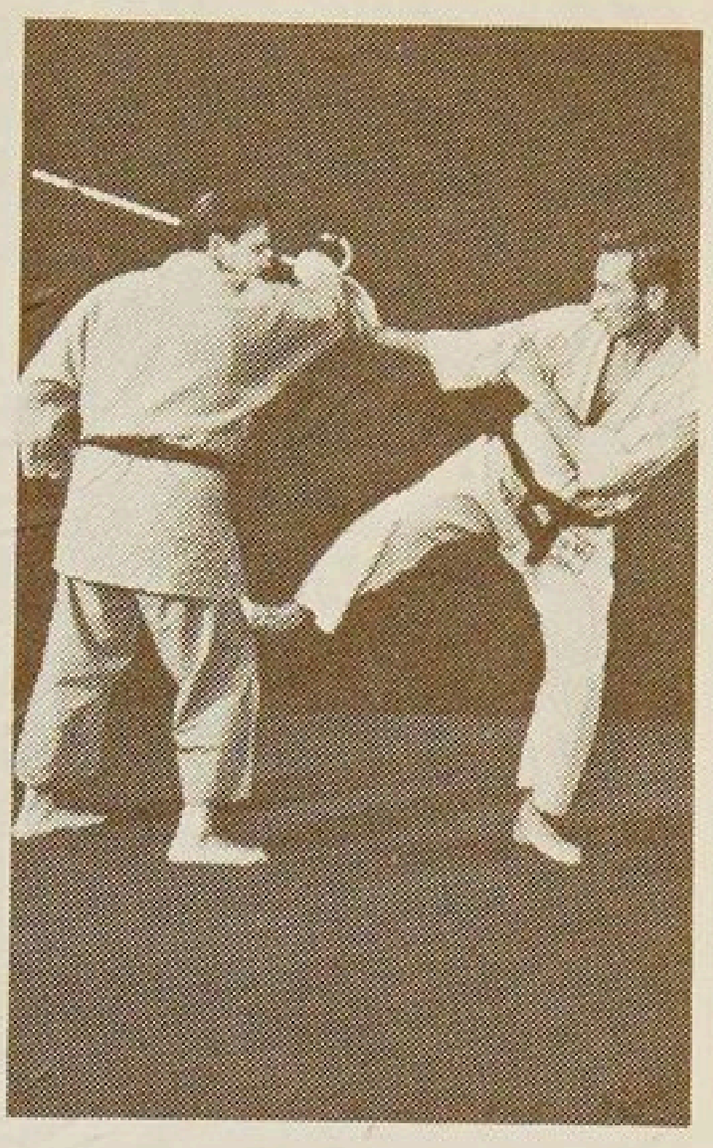
614. Attack is a back-hand stab. You move your head away and slash at his upper arm as you stab into his eyes. Follow up as before.

606

607

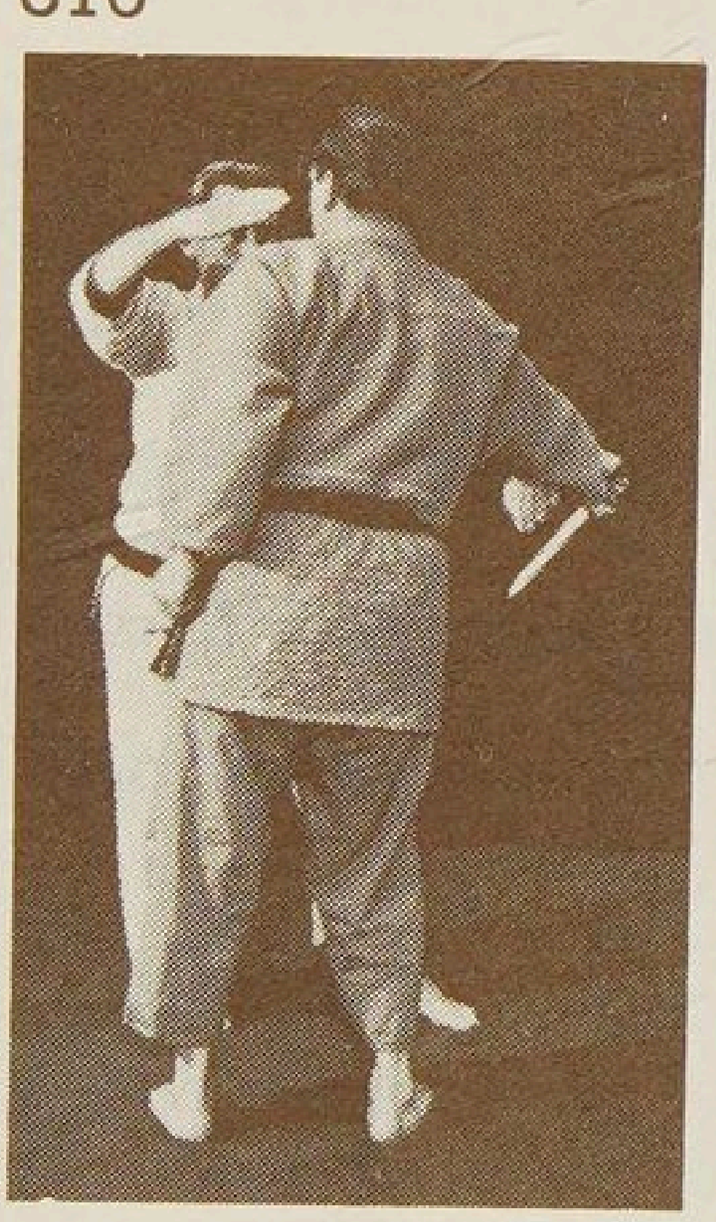


608



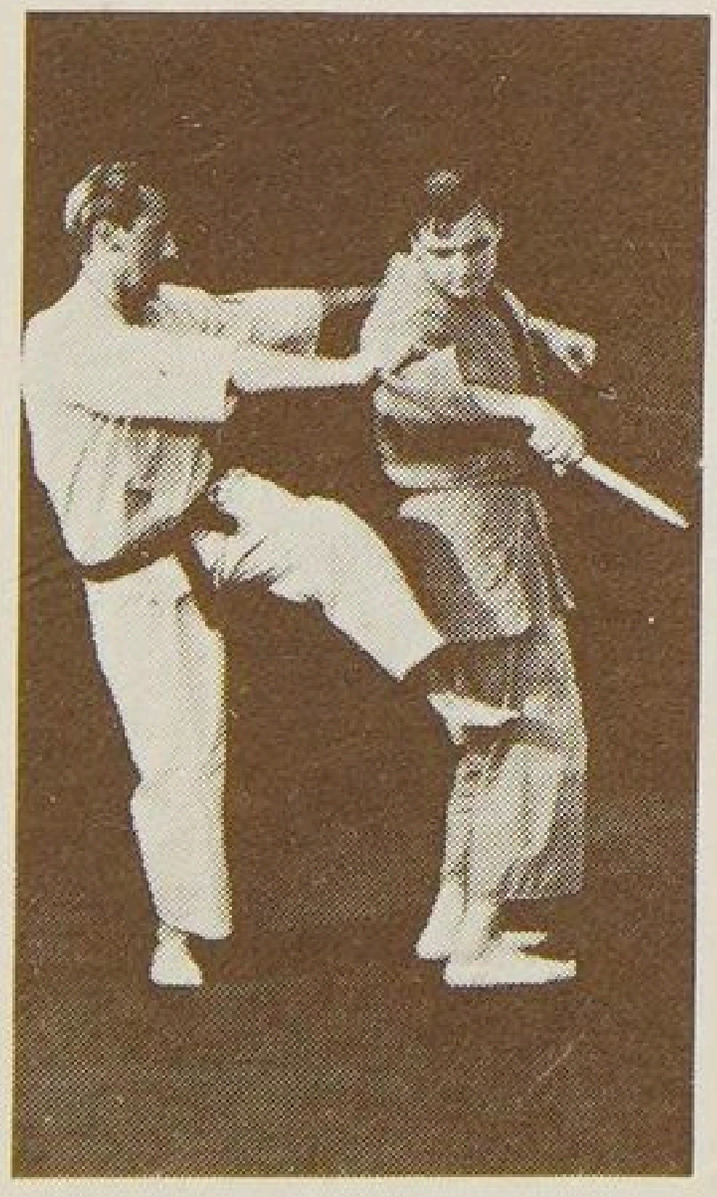
609

610

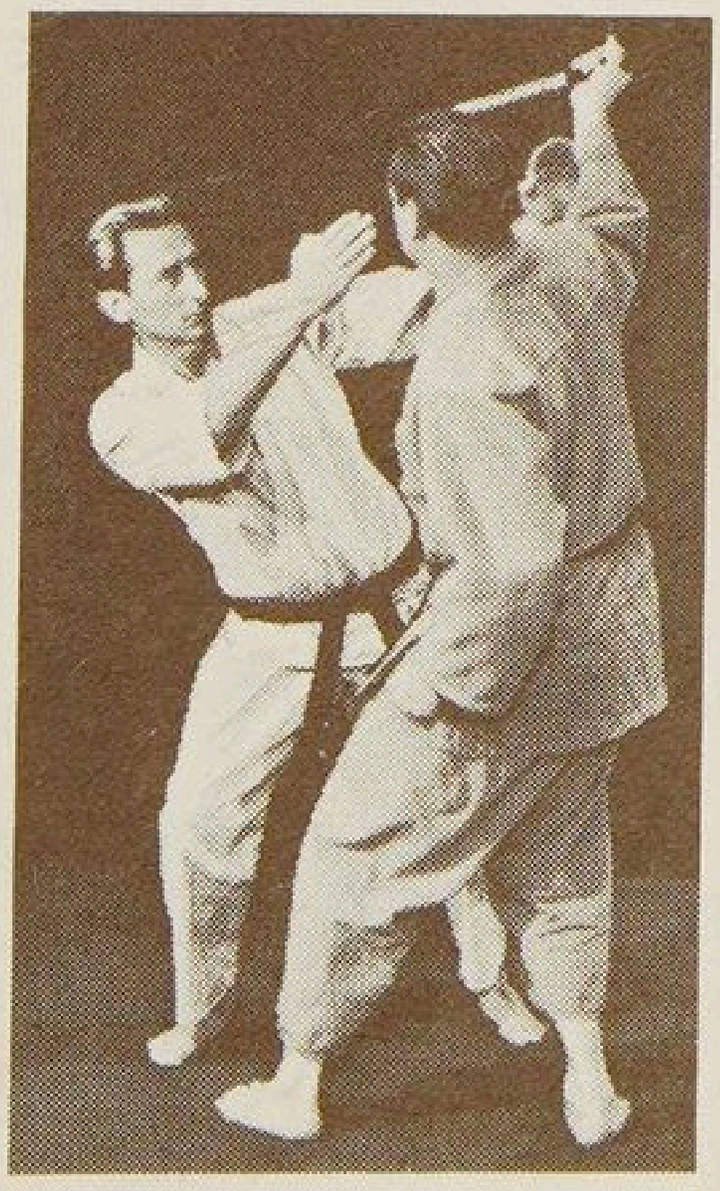


611

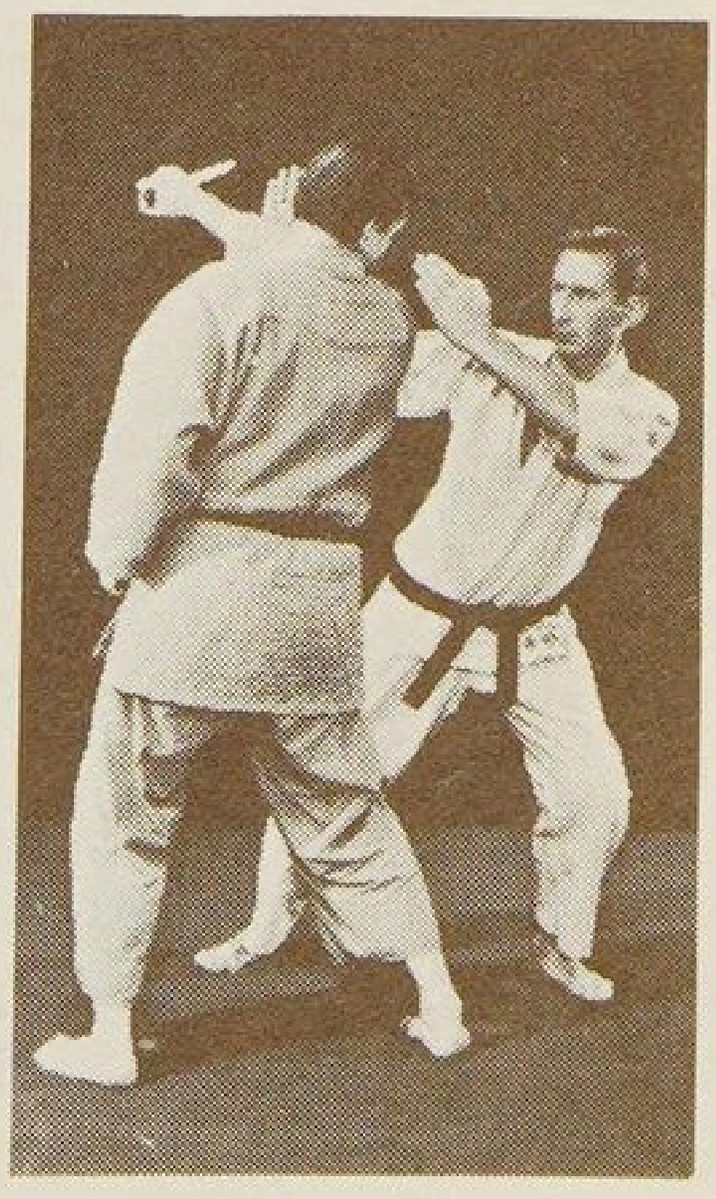
612



613



614



615. Attack is a straight-in thrust. You parry his knife arm with a back-handed blow as you move your body away from the knife thrust and stab into his eyes. Follow up as before.

The demonstrations for the test need only show control of the assailant, the ending blows are not required.

Gun Defense — Rear Threat, Wrist Lock Ending

616. Left partner simulates threat of gun attack from the rear. First, glance back to see which hand holds the gun. Then, distract his attention to the side away from the gun hand; then, striking back with your forearm into the gun hand, turn clockwise.

617. At the completion of the turn, grip the gun and gun hand, locking the hammer to prevent firing.

618. Deliver several forceful kicks into his knee; then apply first wrist hold. swiftly. Disarm him and put him on the ground if necessary.

For the test, disarm the opponent; takedown is not required.

Gun Defense — Walking, Rear Threat

619. Right partner simulates threat of gun attack with gun at your back, forcing you to walk.

620. First glance back to see which hand holds the gun, which in this case is the right hand. Your defense action must, therefore, begin when your right foot is advanced; at that point, instead of taking your next step forward with your left foot, take a quick, deep step back with your left foot as you strike the inside of his gun arm with your left forearm, and without hesitation . . .

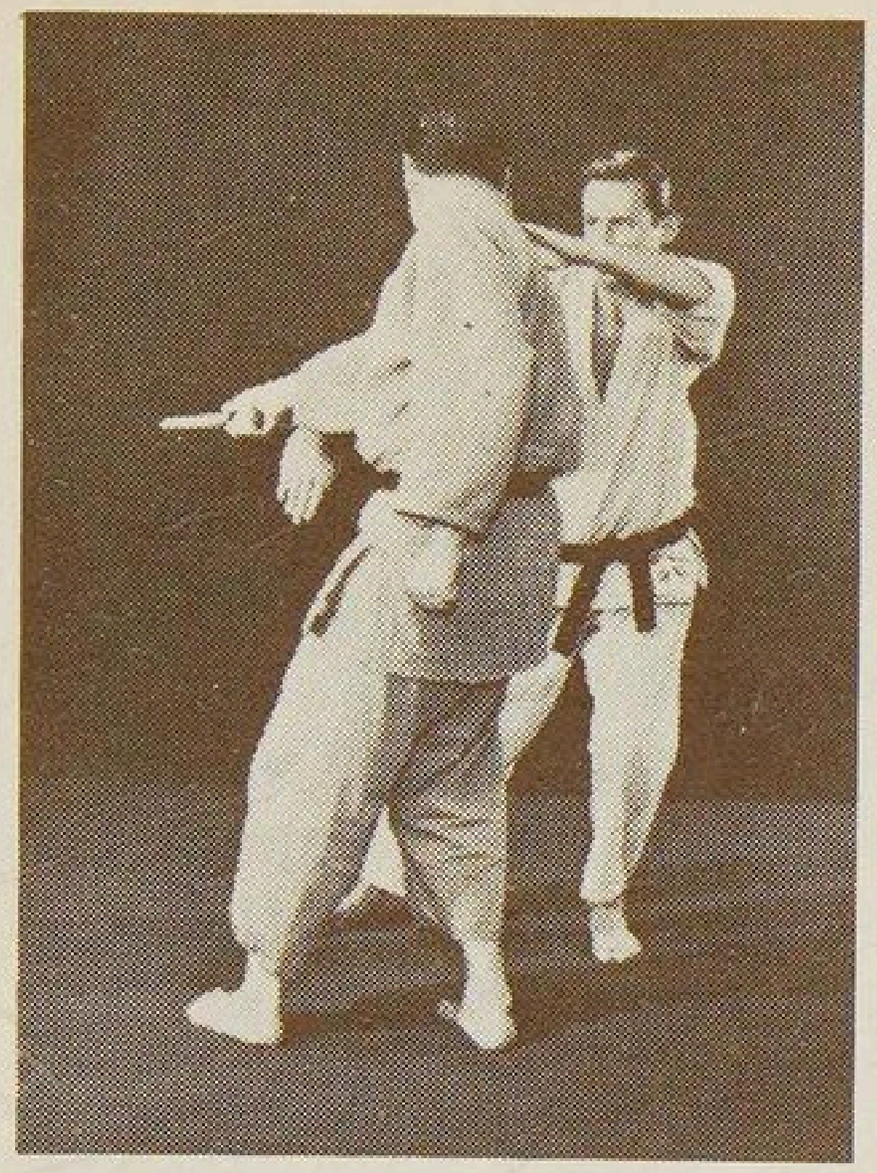
621. . . . apply straight up arm lock firmly, applying pressure to drive him into the ground. Disarm him.

The opponent must be disarmed and put on the ground for the test demonstration.

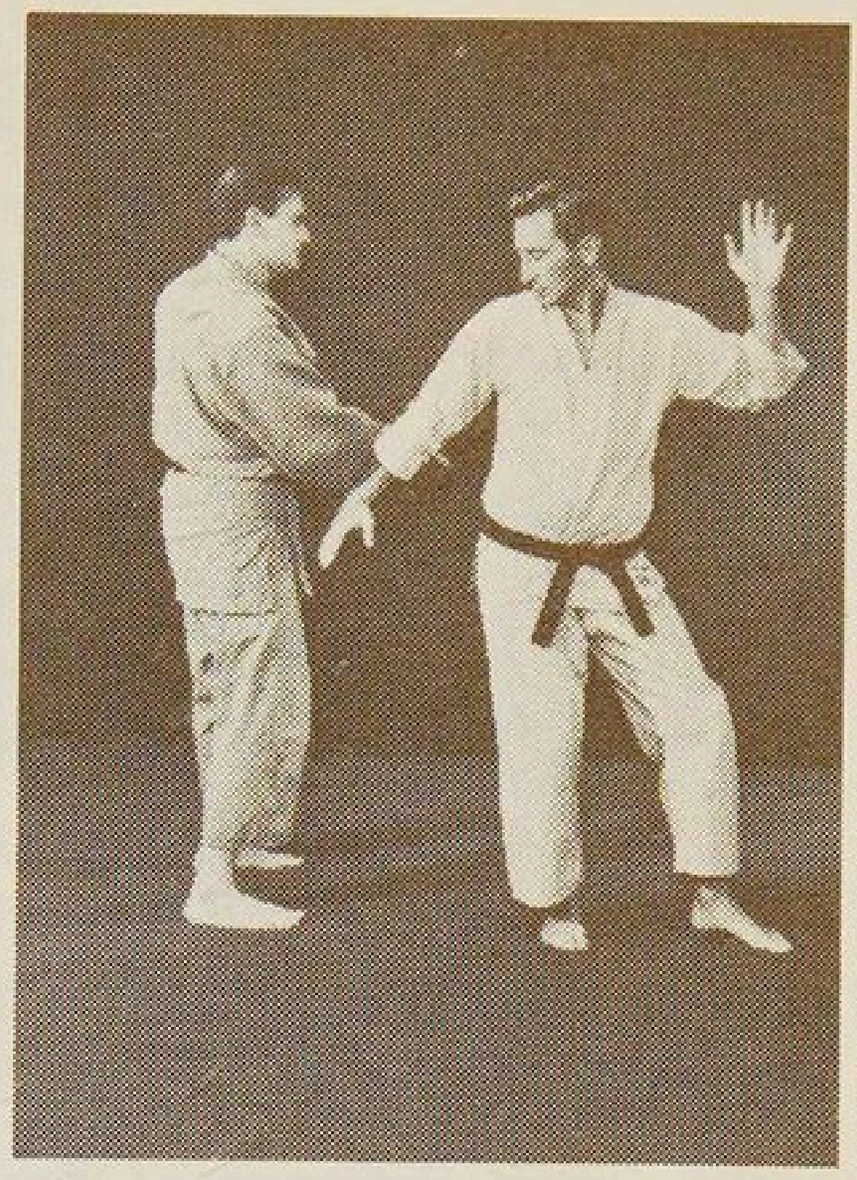
Gang Attack — Four Opponents

The general method of defense against four opponents is based on the same procedures that have been taught previously. For test demonstration for black belt rank, the student is expected to respond swiftly and with greater technical proficiency than before. On the street, the simple fact of making a defense against four

615



616

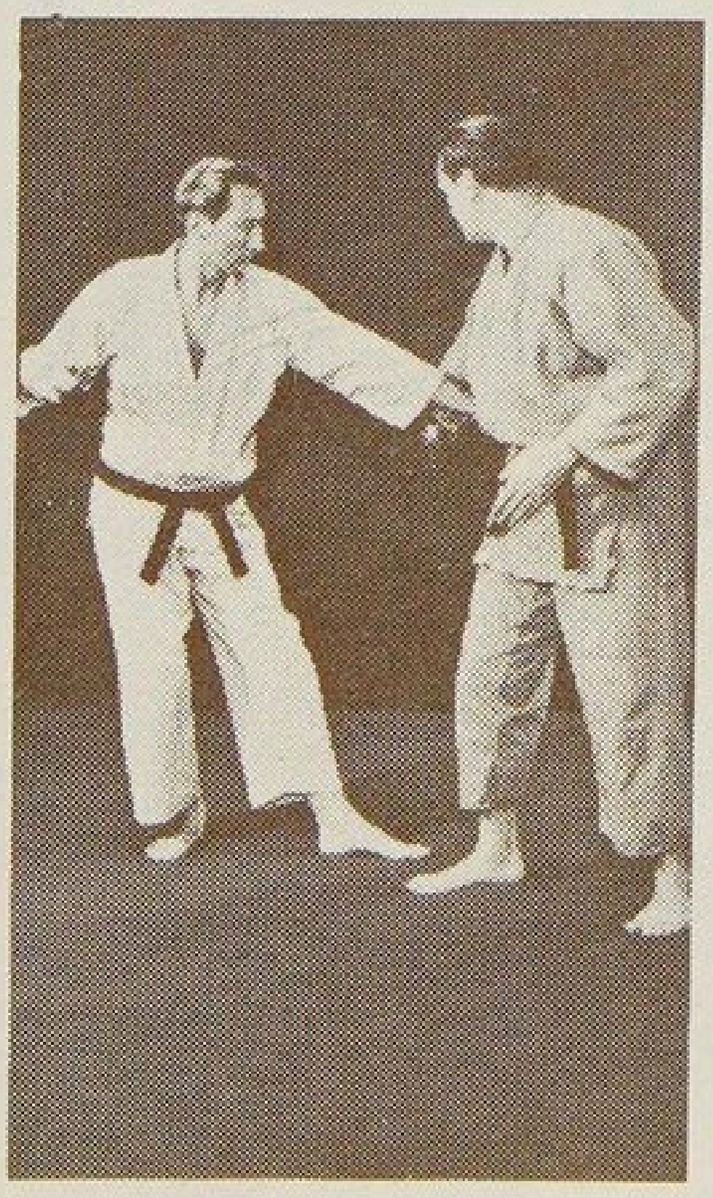


617

618

619

620

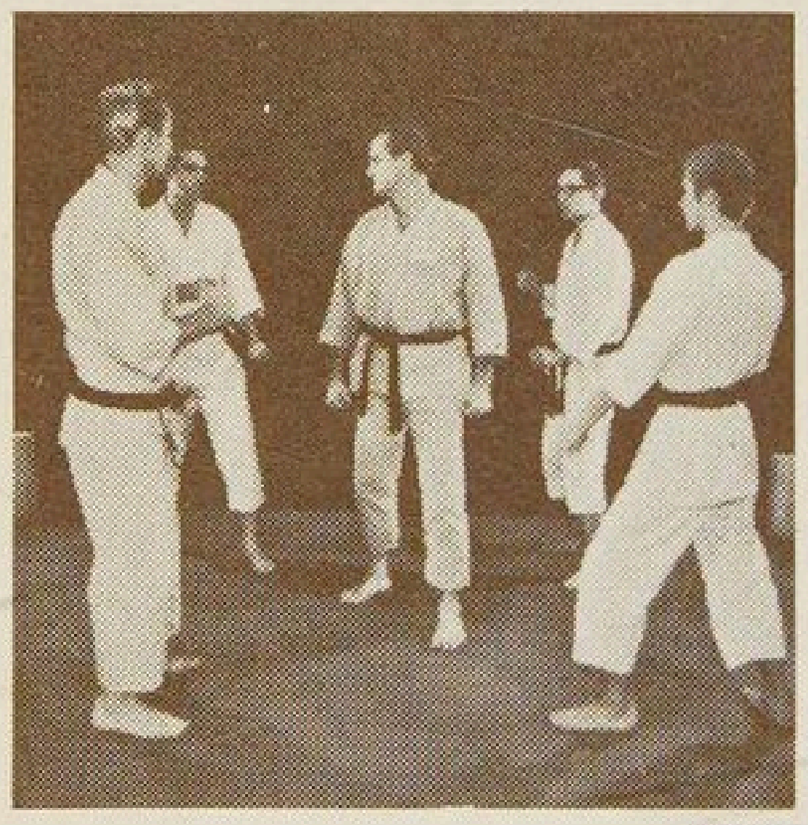


621

opponents is half the battle. If you move about from attacker to attacker, with great show of courage and much yelling, you could successfully defend *without* technical perfection. But, since this rank is an indication of expert ability, the test must show high skill, coordination, control, and speed.

622 to 628. For your first move, attack the biggest assailant or the leader. Throughout the next series of sequences, you should be in action against three opponents simultaneously. By shoving the first man into the second and kicking at the third, you are preventing and retaliating against three people each time. Repeat this action, kicking the closest man and shoving him into the next closest and attacking another man. This is repeated, as necessary.

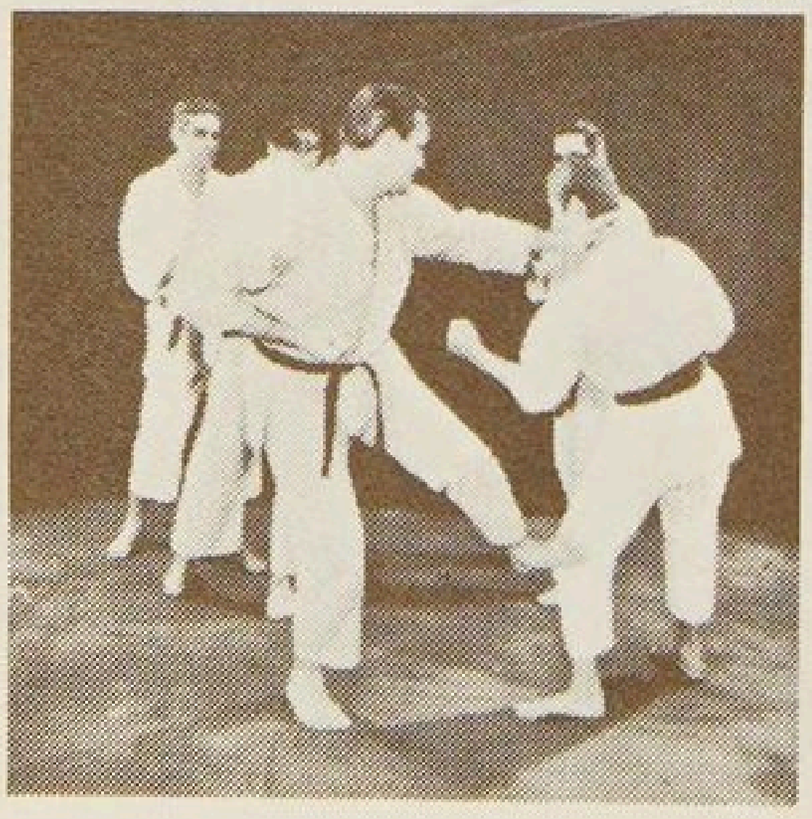
The same general procedure as in previous tests is used to demonstrate this defense. Of course, greater speed and precision are expected.



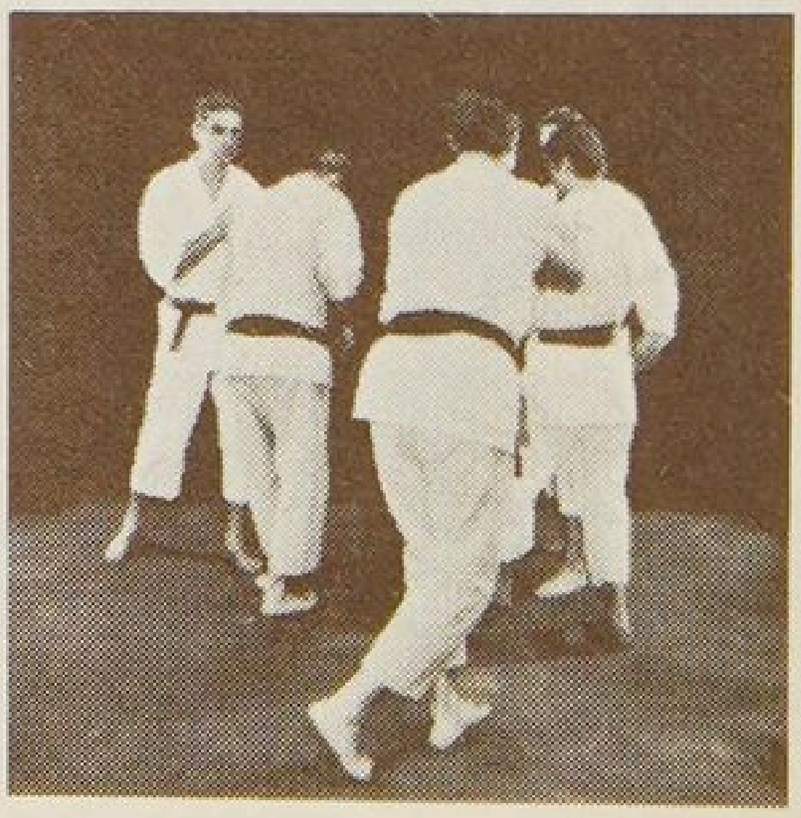
622

623

624

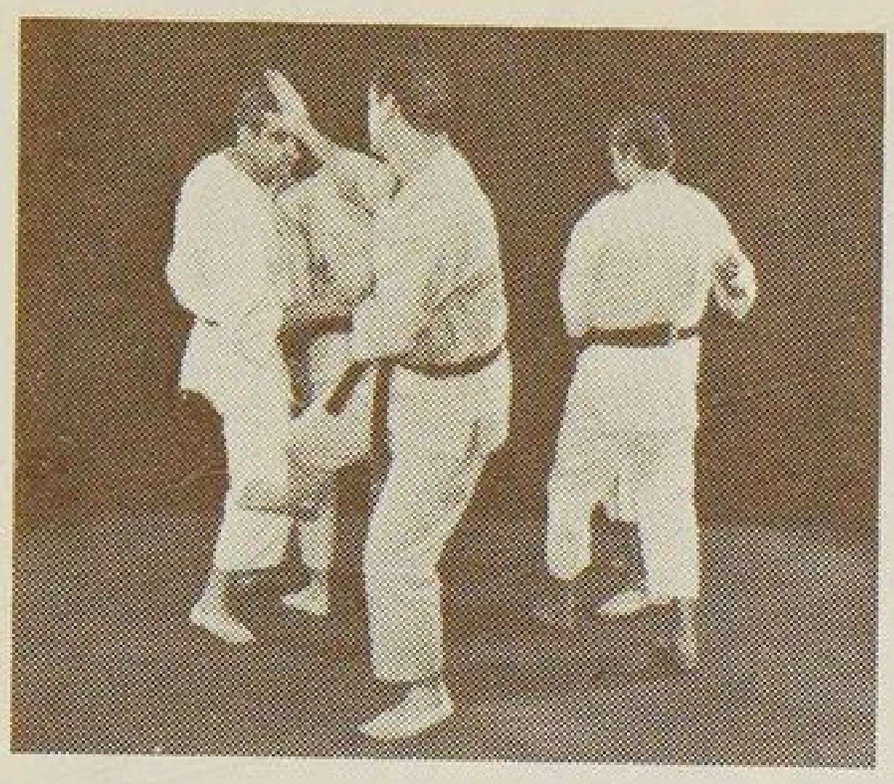


625

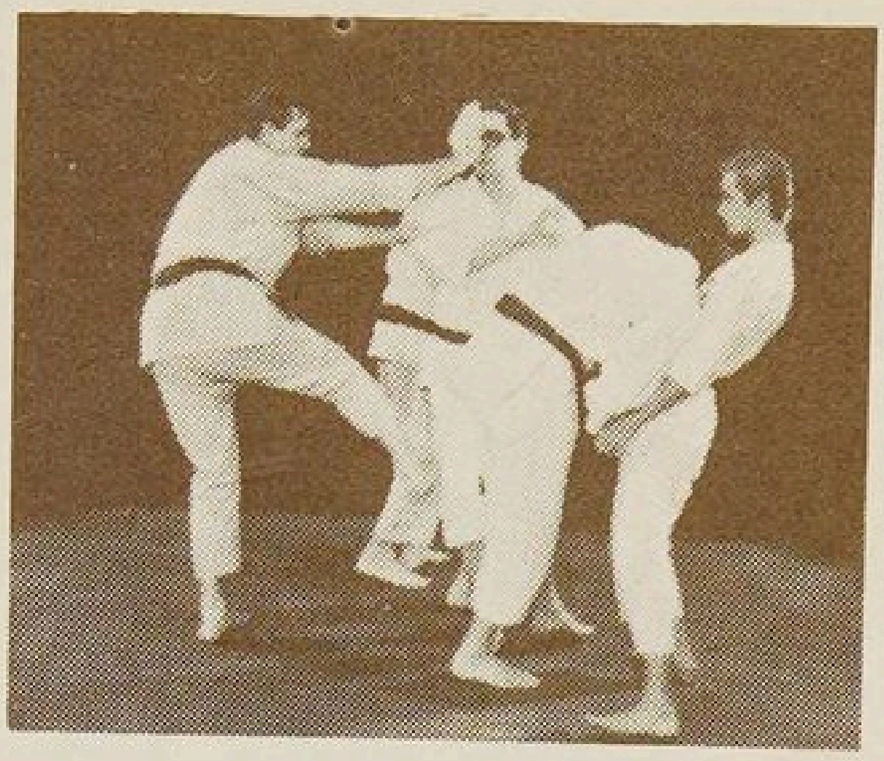


626

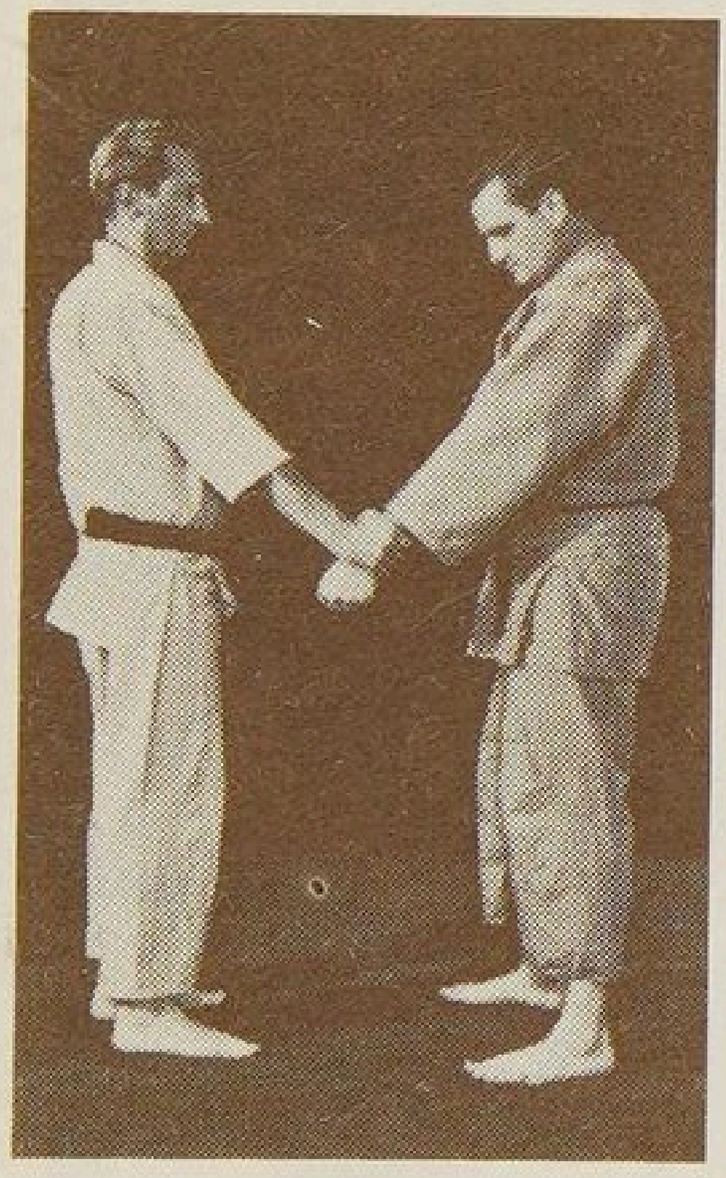
627



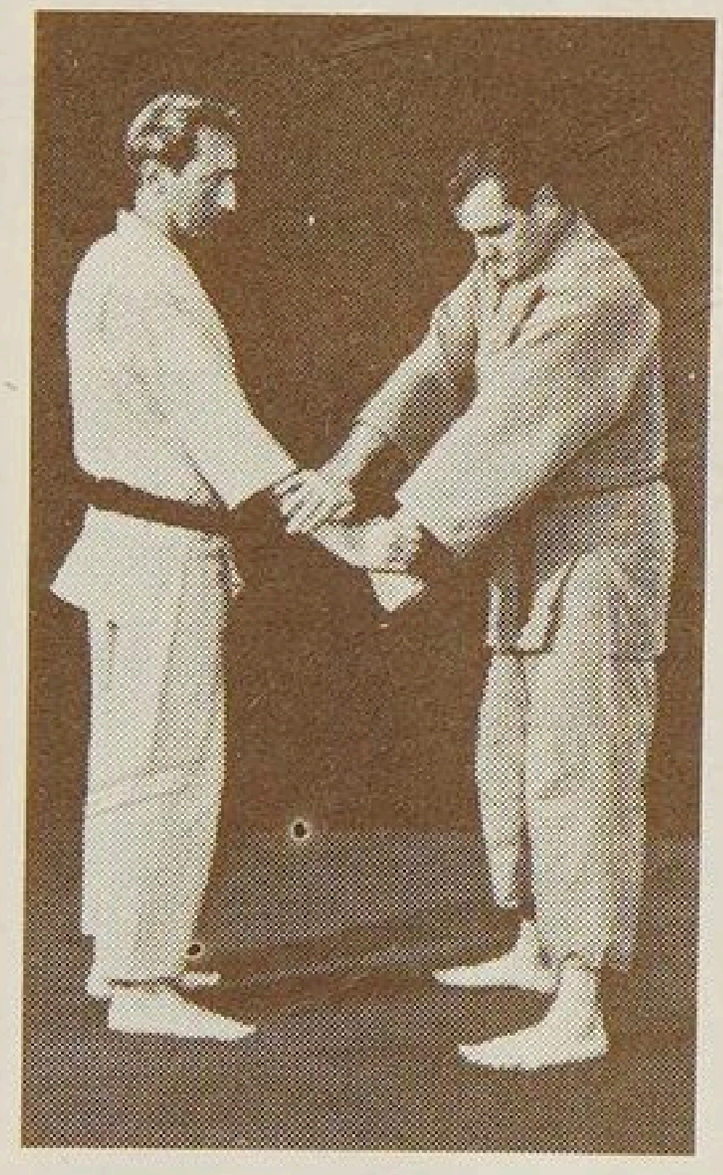
628



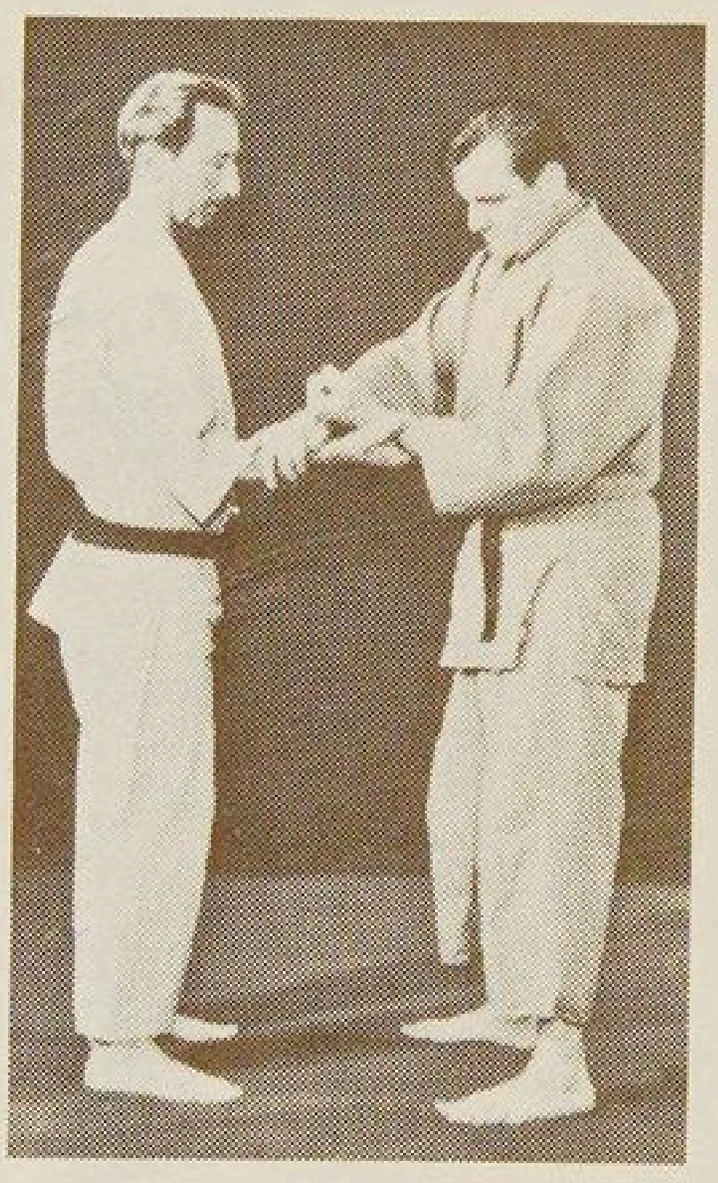
629



630



631



AIKIDO WRIST GRIP RELEASES

The aikido wrist grip releases are not altogether practical for street use; they are more intricate and require more precision and perfection of technique than the average student can manage. It is exactly for this reason that these releases are included in the test for black belt rank ; those of you who have reached this high level of skill should be able to demonstrate the precision and swiftness needed for successful use of aikido releases, even though you might choose to *use* others for actual self-defense.

Release from One Hand Grip

629. Left partner grips your left hand with his right hand.

630. Place your right hand onto his right wrist; make a fist of your captured hand and bend it double.

631. Roll your fist upright, as shown. Notice that the wide part of your wrist appears between his thumb and fingers.

632. Twist your wrist back so that the narrow part of your held wrist is at the opening between fingers and thumb and pull your captured hand cross-body for release. Your right hand stays in place at his wrist throughout the action.

633. With the freed hand, simulate retaliatory blow.

Release from Cross-Hand Grip

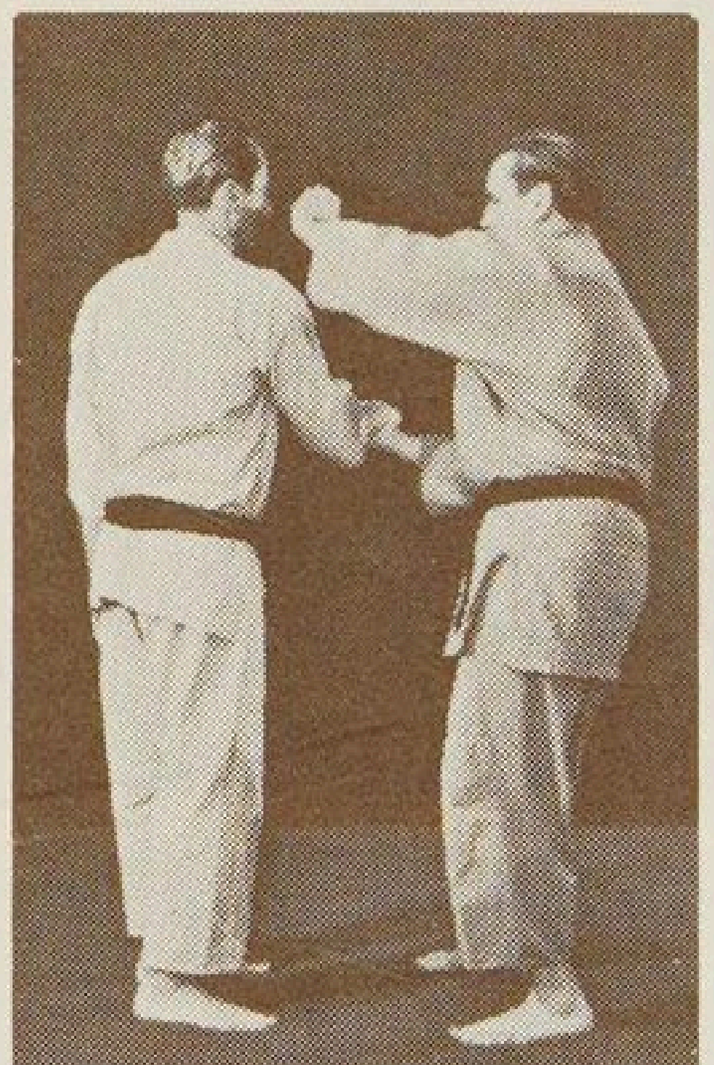
634. Left partner grips your right wrist with his right hand.

635. Place your left hand at the back of his right hand, pressing cross-body slightly.

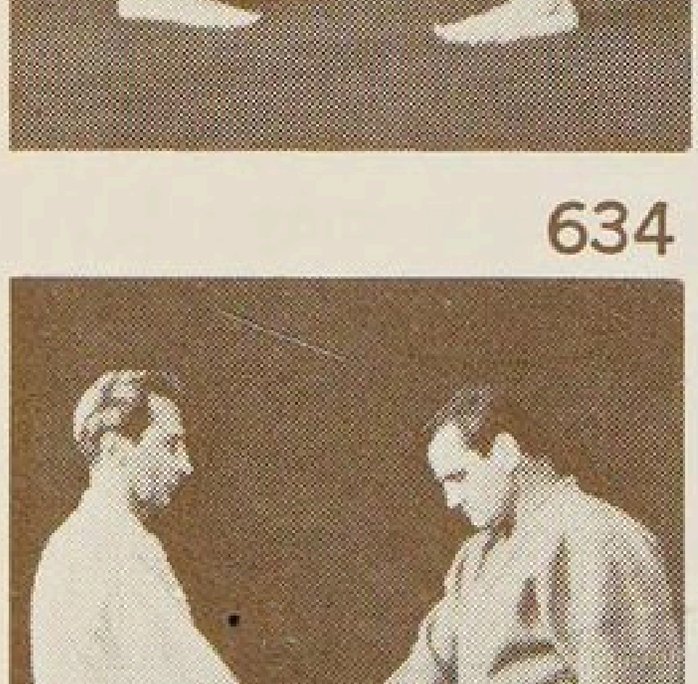
636. As he reacts to the pressing action by opposing it, use the force of his action to help you swing back and raise his arm up and over in a circular direction; during the circular action of his arm, you twist your captured wrist within his grip counter-clockwise.

632

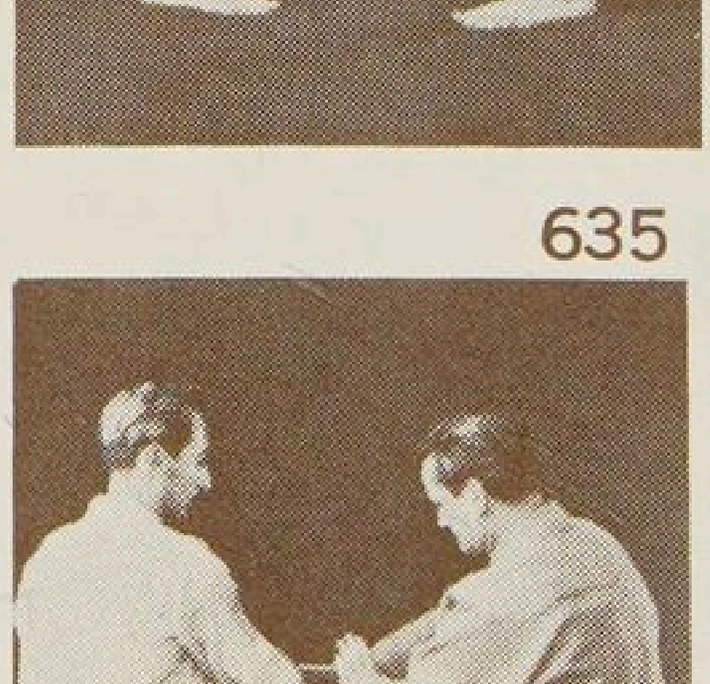
633



634



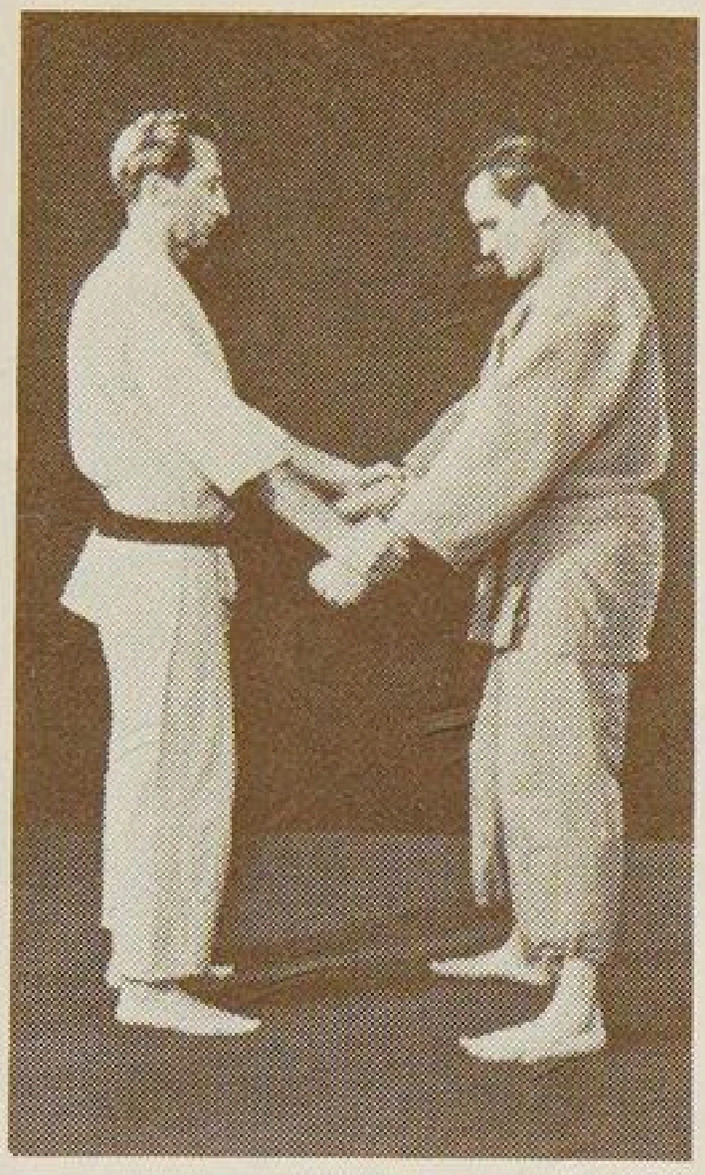
635



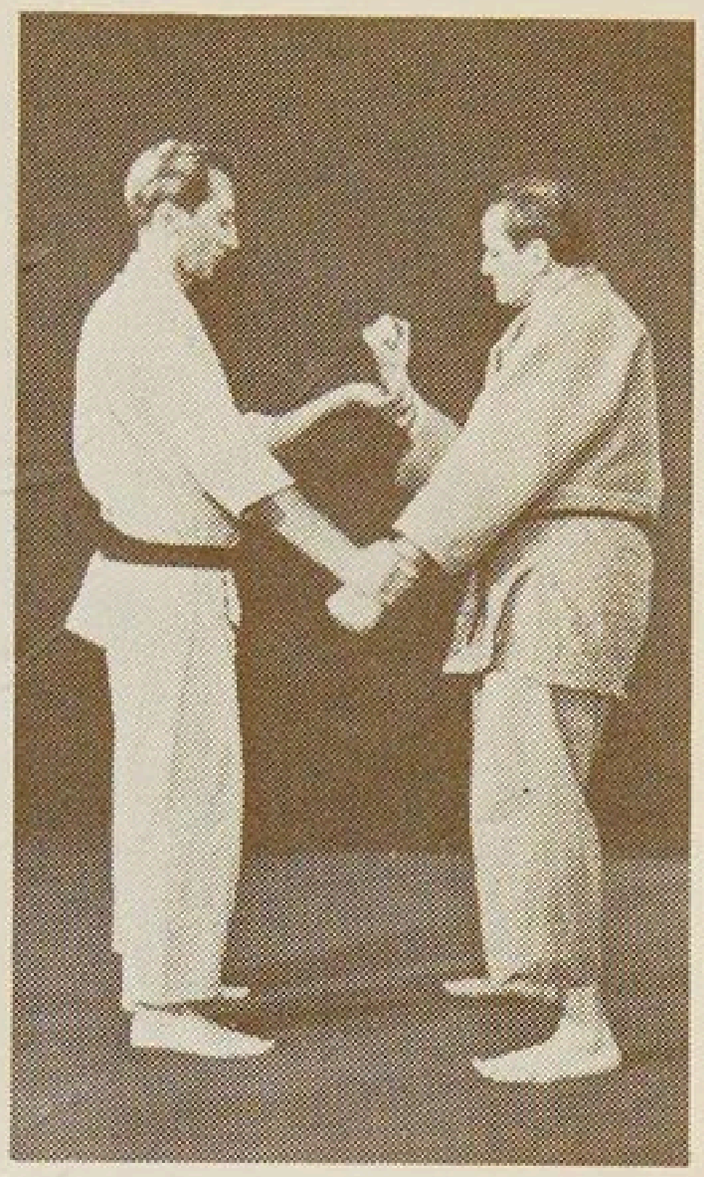
636

637

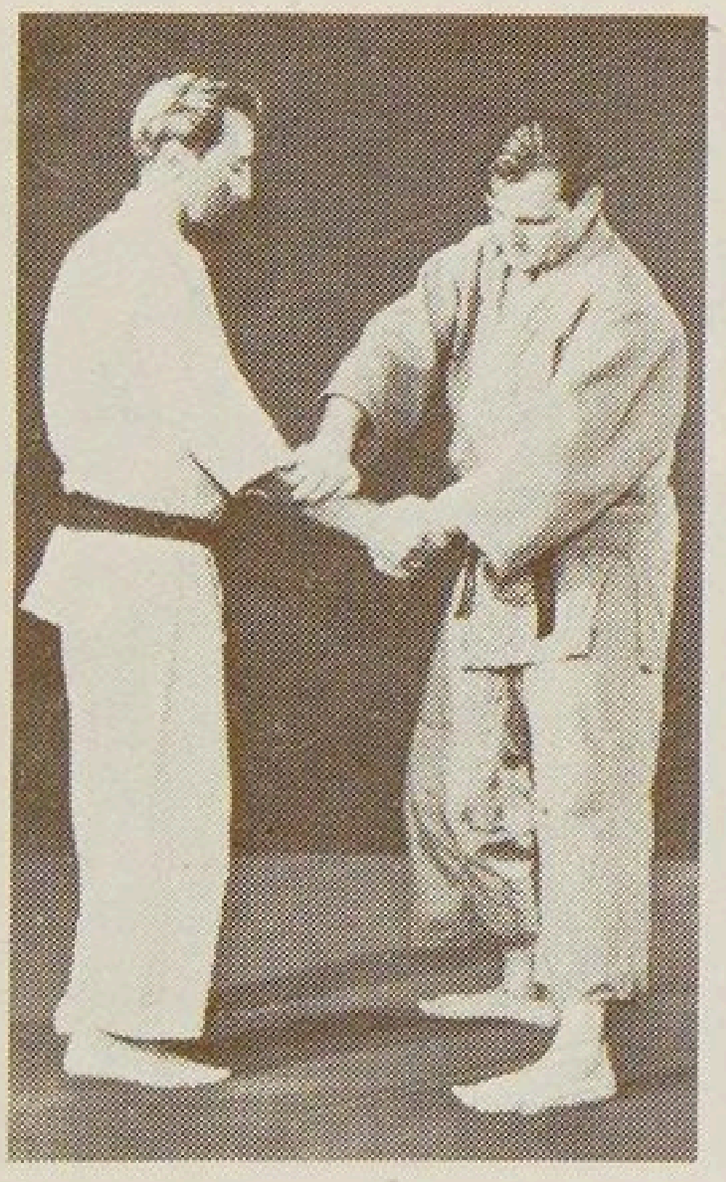
638



639

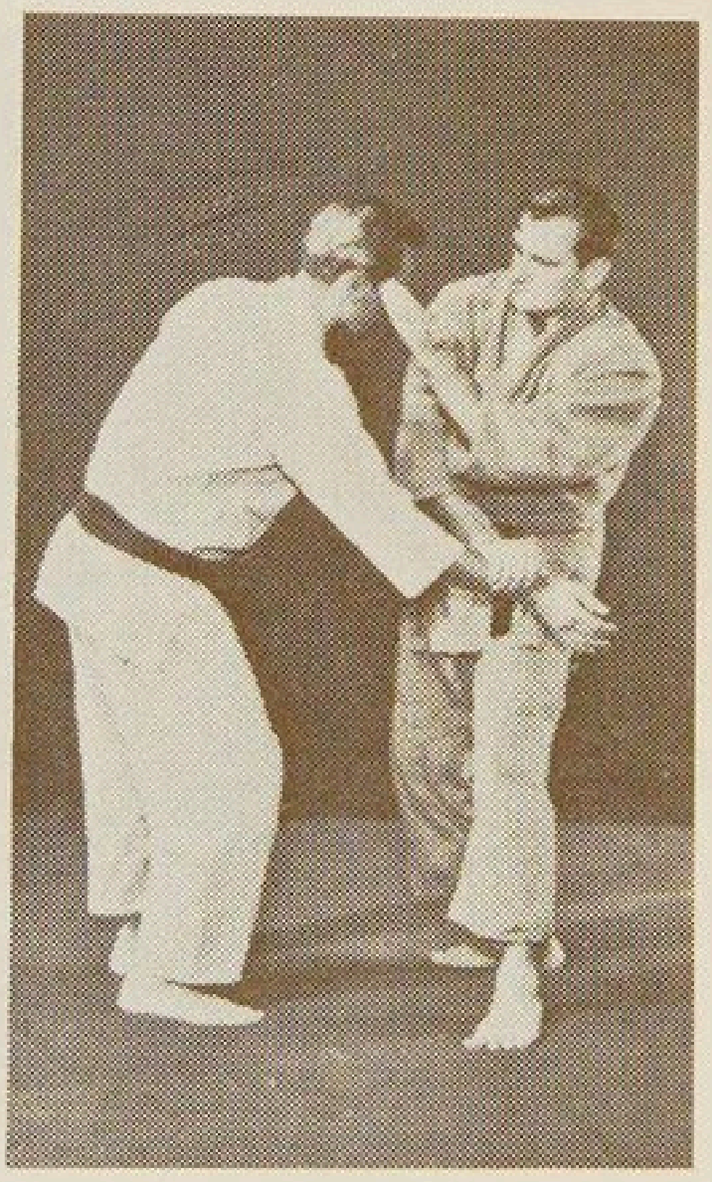


640



641

642



637. Grip his wrist with your captured hand; apply pressure by raising your elbow and pushing down with both hands.

Release from Two-Hand Grip

638. Left partner grips both your wrists with both his hands.

639. First release your right hand. Make a fist of your captured hand, roll it outward and when you feel his resisting opposition inward, change the direction and roll of your captured hand outward and release through the weak area of his grip between thumb and fingers.

640. Place your free hand at his right wrist.

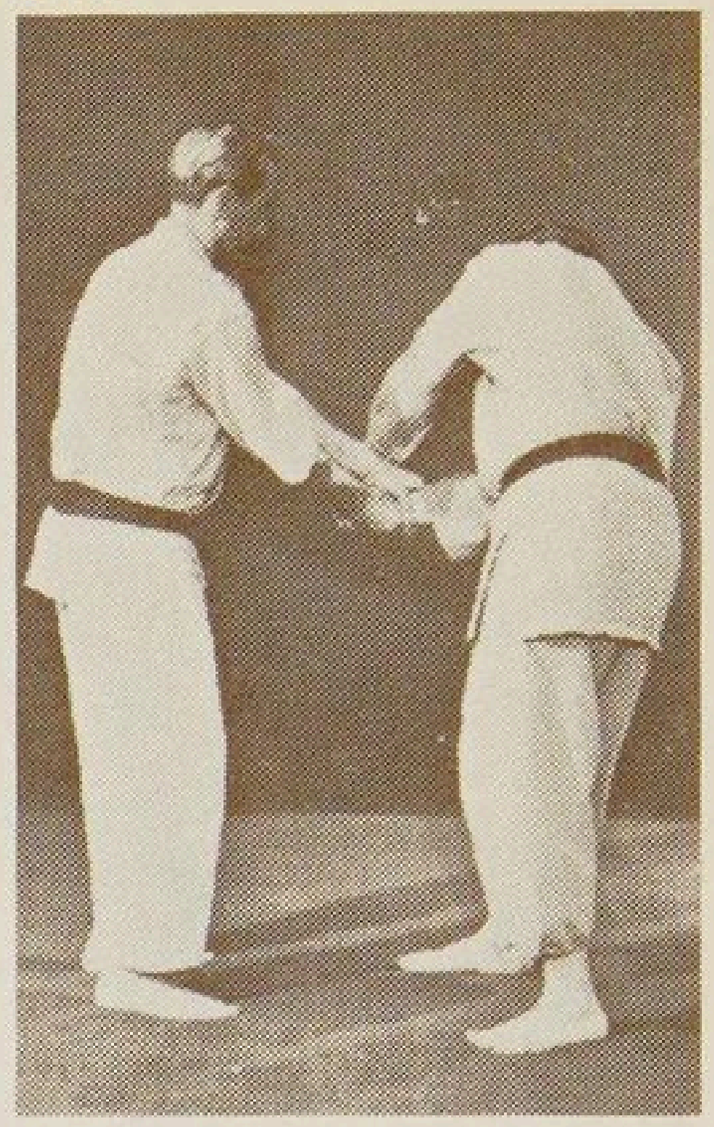
641. Roll your left hand up and outward in a circular movement and effect release at the weak grip area between his thumb and fingers.

642. Simulate retaliatory blow with left hand.

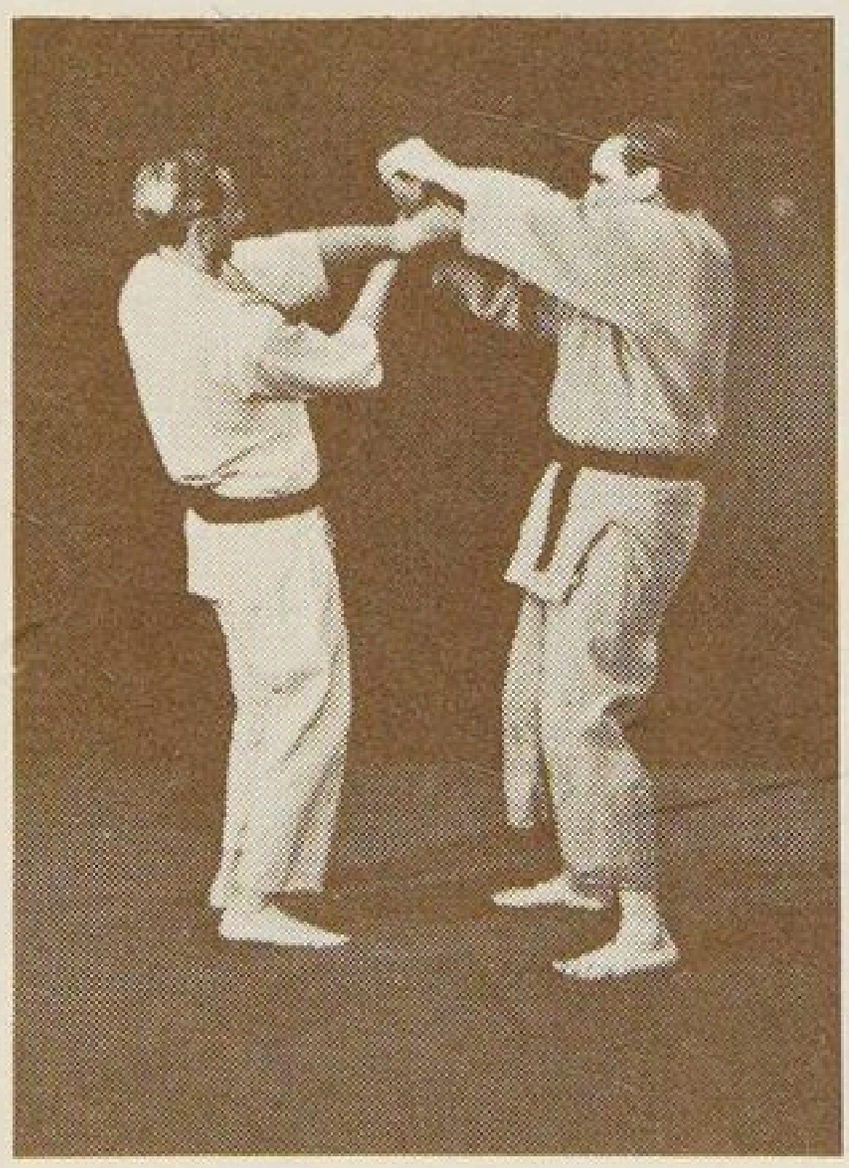
643

644

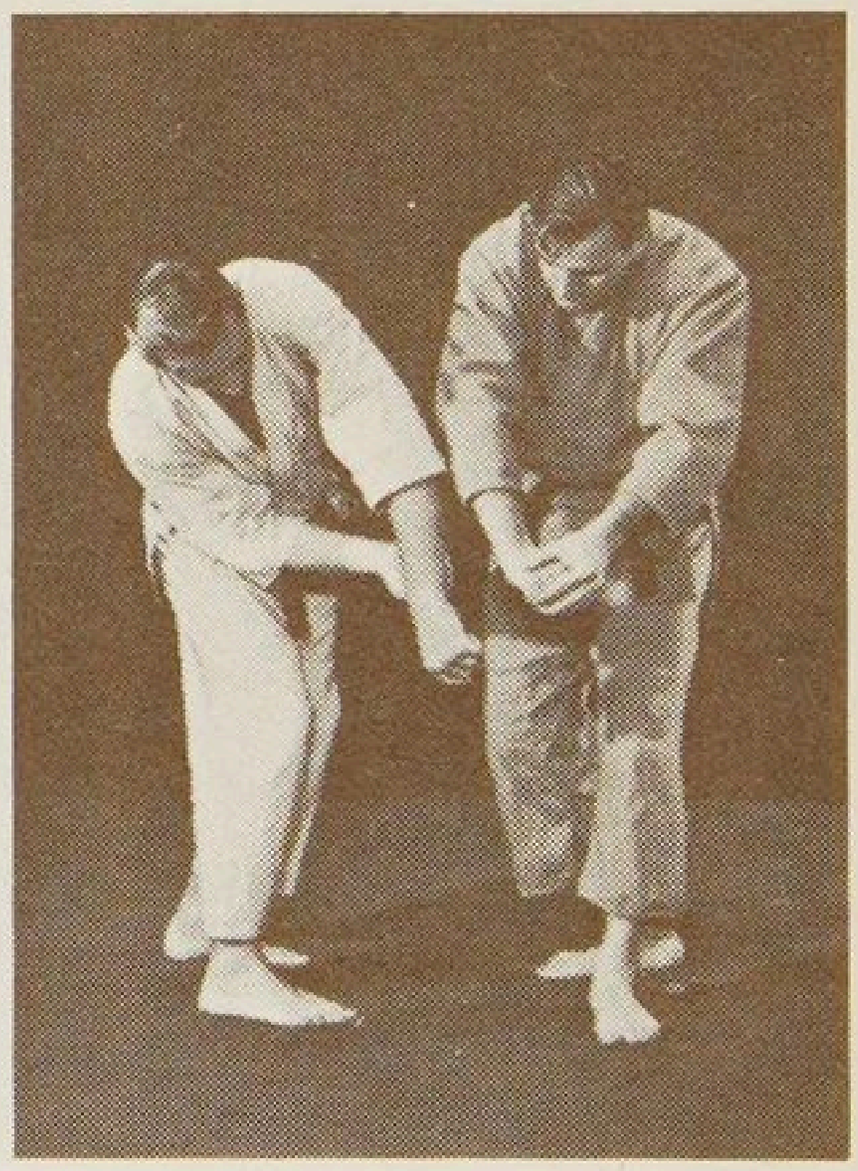
645



646



647



Release from Two-Hand Grip Against One Wrist

643. Left partner grips your right wrist with both his hands.

644. Pull your captured hand cross-body slightly.

645. As you feel his resistance to the opposite direction, swing your captured arm in the same direction and reach over to grip your captured hand with your free hand.

646, 647. In a high arc, move your hands counter-clockwise up, over, and then down toward the mat. Simulate a retaliatory back-handed blow.

STICK FIGHTING

Why Stick Fighting

Except in special and particular professions and situations, it is a great mistake to depend on weapons for self-defense. The exceptions are those in which the individual is faced with the possibility of grave danger in the course of his work: law enforcement officers, guards, night workers in unprotected areas, etc.; the other exception is when the individual is more than ordinarily helpless: invalids, the disabled, the very frail, etc.

The grave danger of depending on a weapon of *any* sort is that the person who expects to use the weapon is psychologically more helpless without the weapon than he needs to be. The other danger of depending on a weapon, and this is especially true when the weapon is a gun, is that the weapon will be used instead of other, more appropriate techniques of self-defense. There are more people killed in gun accidents, and more innocent people killed by guns than there are shootings of criminals!

Completely unsupervised and unregulated possession and use of guns in this country is a great threat to innocent people. Even the police, if adequately trained, could subdue and control many of the unruly people they are confronted with using less violent means than guns and with perfectly adequate protection to themselves. The police baton, though viewed with disfavor by most laymen, is certainly a more humane weapon than a gun. Properly used, the baton (and the yawara stick developed by the Tokyo police department) offer very effective protection to the law officer, while presenting much less danger of permanent and serious injury to the subject.

The situations in which a gun is the appropriate and necessary defense weapon are more rare, even for law officers, than the situations in which a stick weapon would do the job as well, or better.

Though jukado is intended primarily for the layman, training in the different forms of stick fighting is required as part of the test for black belt because this high rank, which indicates very advanced training in techniques of self-defense, should include knowledge of techniques which are special and exceptional.

HOW TO HOLD SHORT (YAWARA) STICK

The short stick is about six inches long and the striking edges protrude about an inch or so from each side of the fist. Short sticks of various types have been used as improvised weapons for as long as there is any record of fighting. The value of the stick is that it permits striking with extra force. The techniques which are shown here with the yawara stick may be utilized with a great number of improvised stick weapons including comb, pencil, pen, small piece of wood, etc. The yawara stick, developed by the Tokyo police department, is grooved for finger grips.

648. Although both ends of the yawara stick are exactly the same, we refer to the end which protrudes from the thumb side of your hand as the point. Here the stick is held point forward.

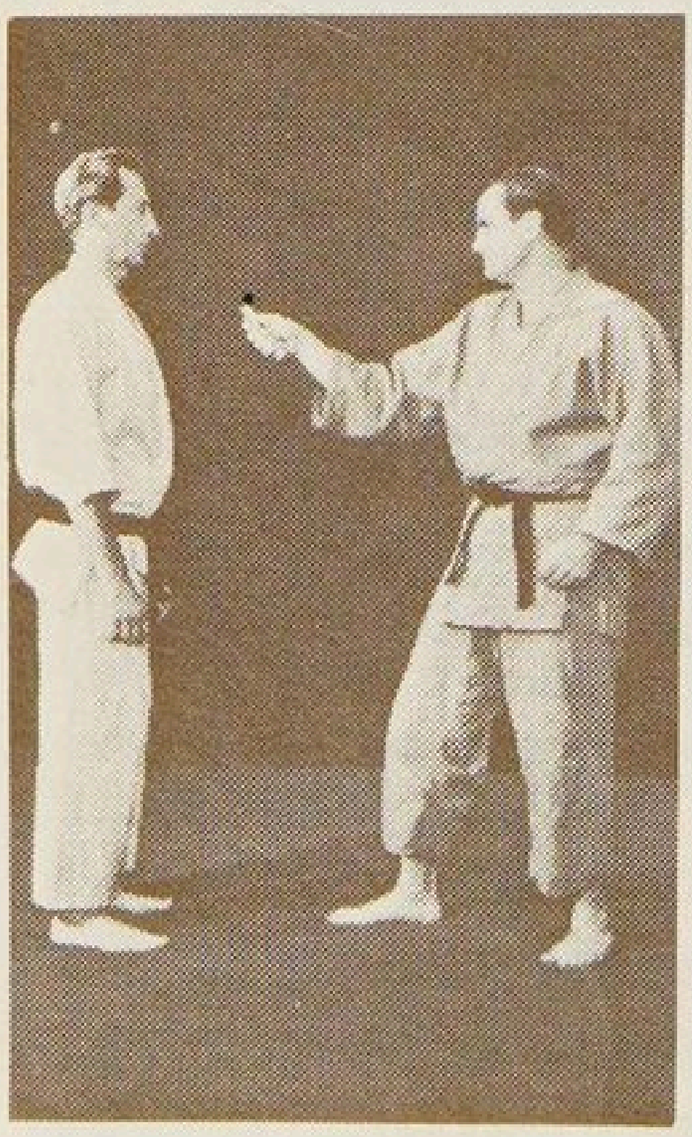
649. Butt forward.

650. Since the stick is best used in conjunction with hand and foot blows, here is an example of the stick held point forward, from the T-stance and high guard.

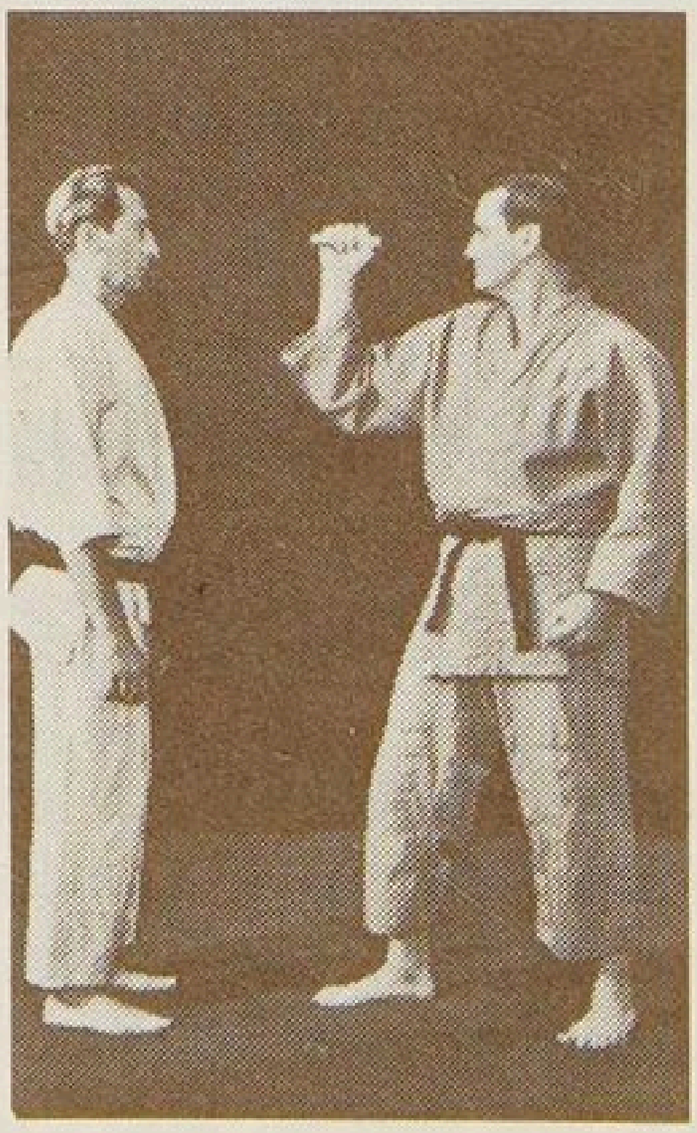
651. Spring tension, butt forward. This is similar to the spring tension ready stance; the left hand pulls back as the right hand holding the stick pushes forward. If necessary, the first blow is released with added power of tension.

652. The non-aggressive position; stick held downward at your side, ready to use, but not threatening.

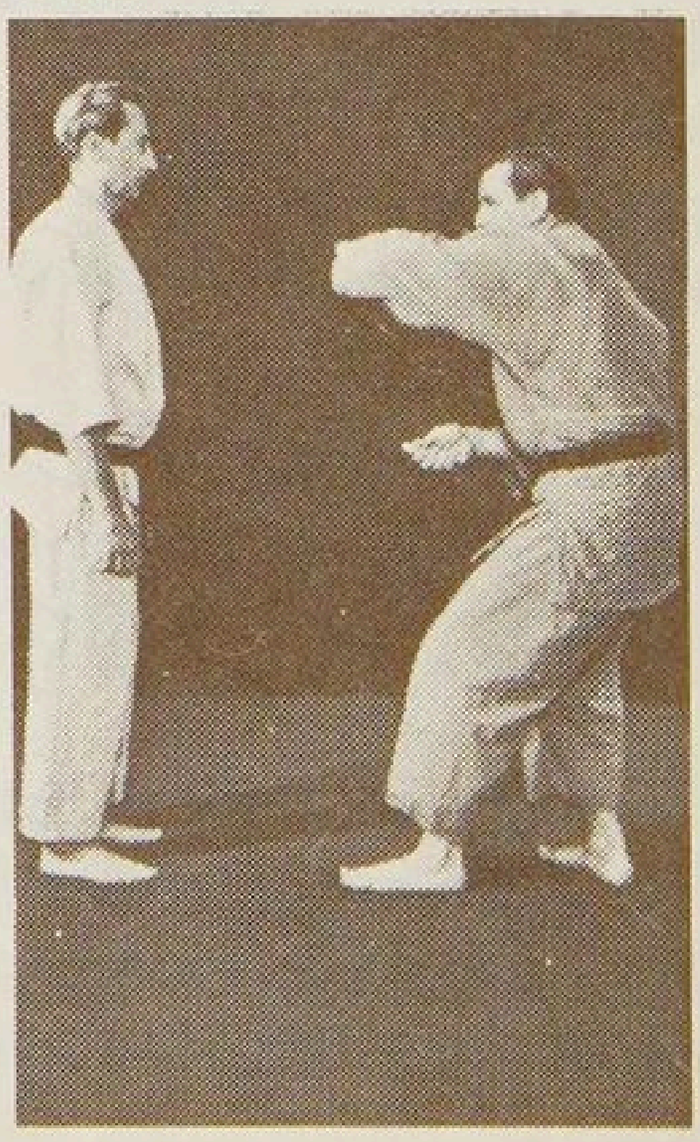
648



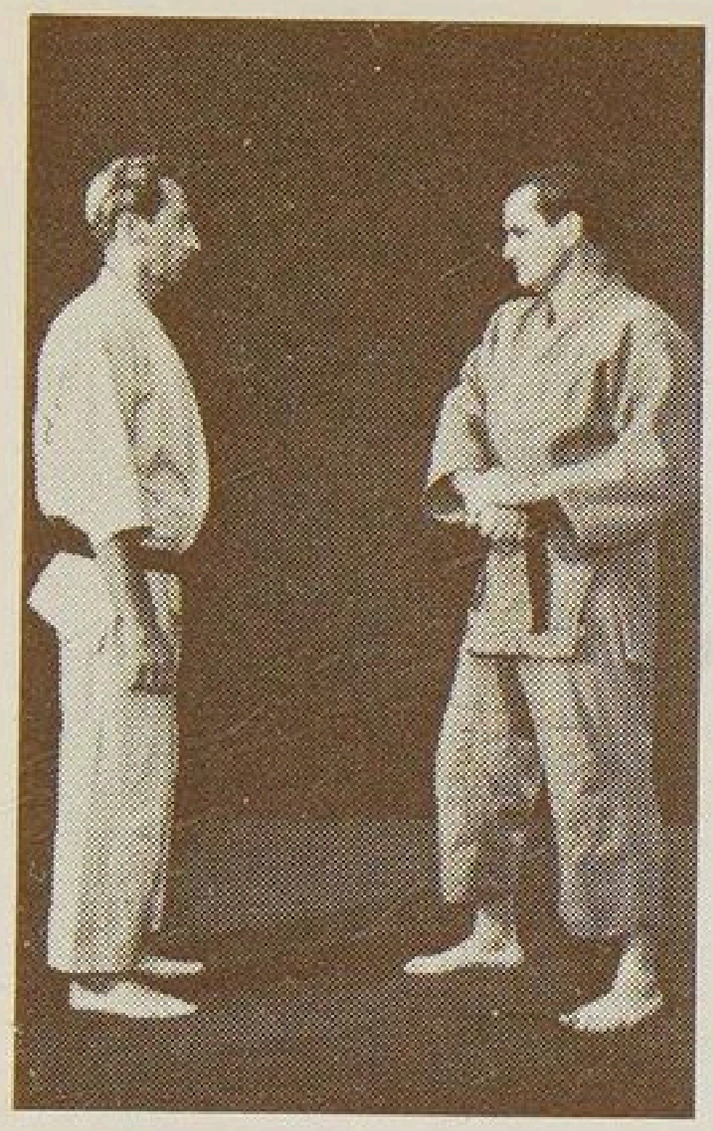
649



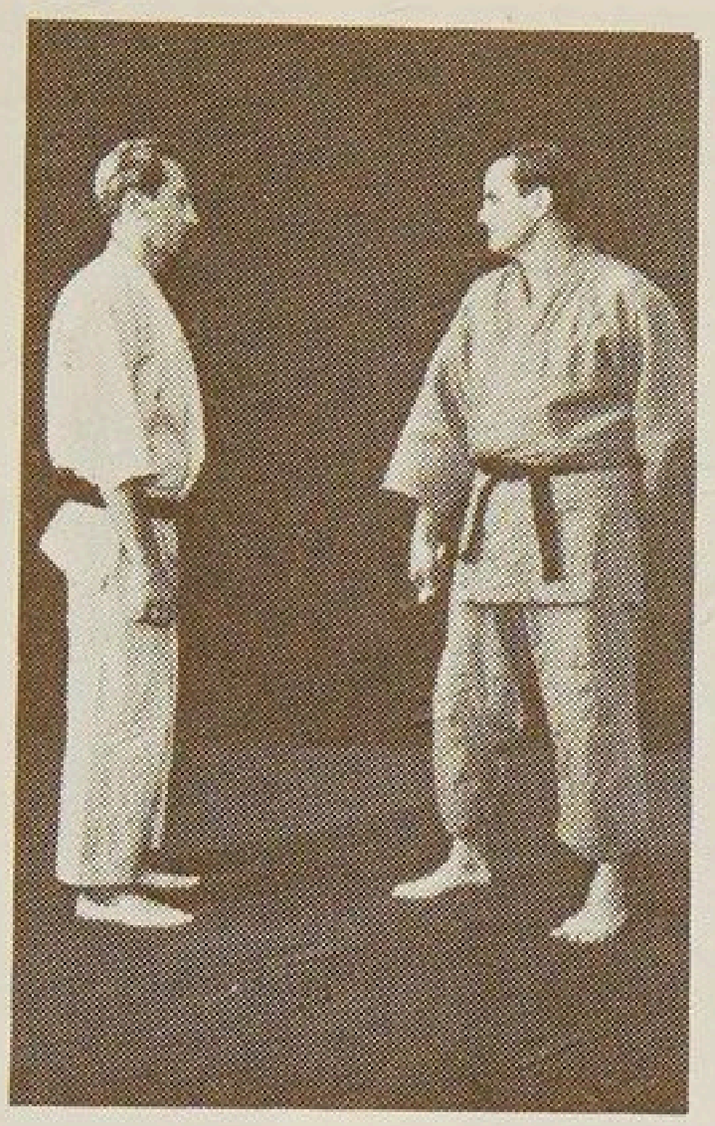
650



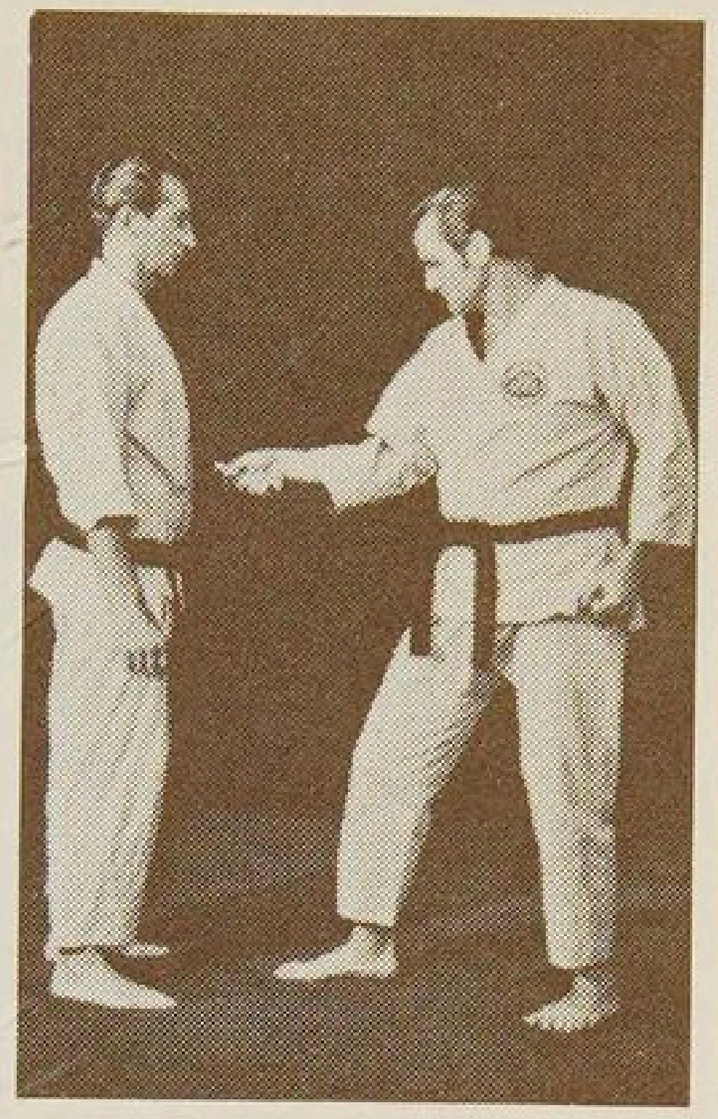
651



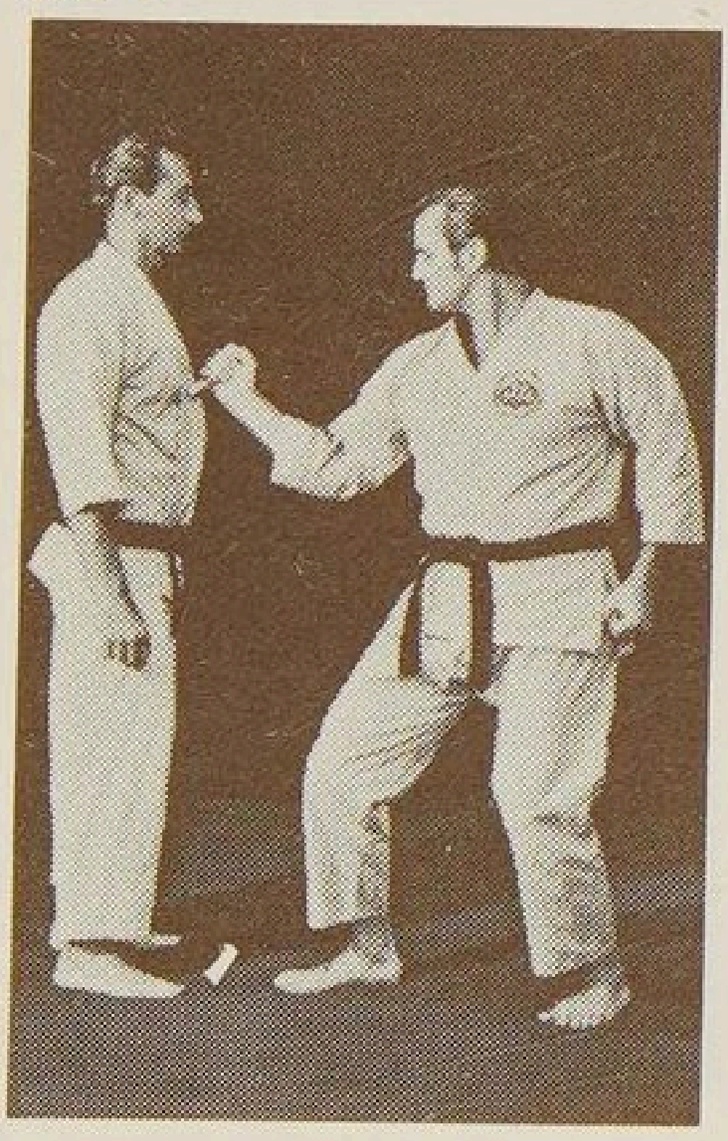
652



653



654



655

656

SMALL STICK (YAWARA) ROUTINES

Effective use of the yawara stick depends on the ability to deliver blows in combinations, quickly, smoothly, and with appropriate response to situations. Here are examples of three such combinations. For the test, they are to be demonstrated as shown.

Vertical Series

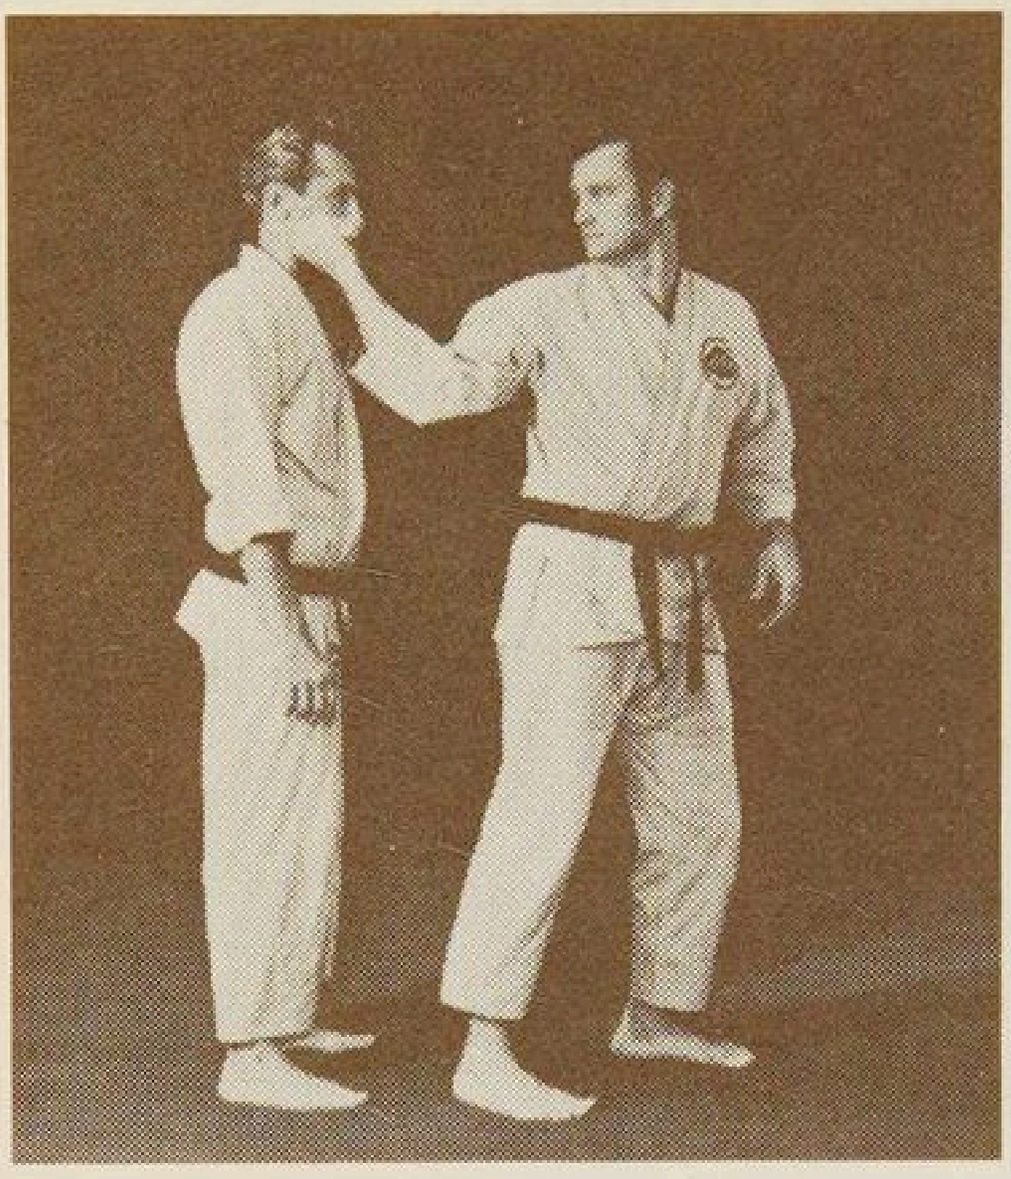
653. A blow into the midsection with the point.

654. Followed by a second blow into the midsection with the side of the butt.

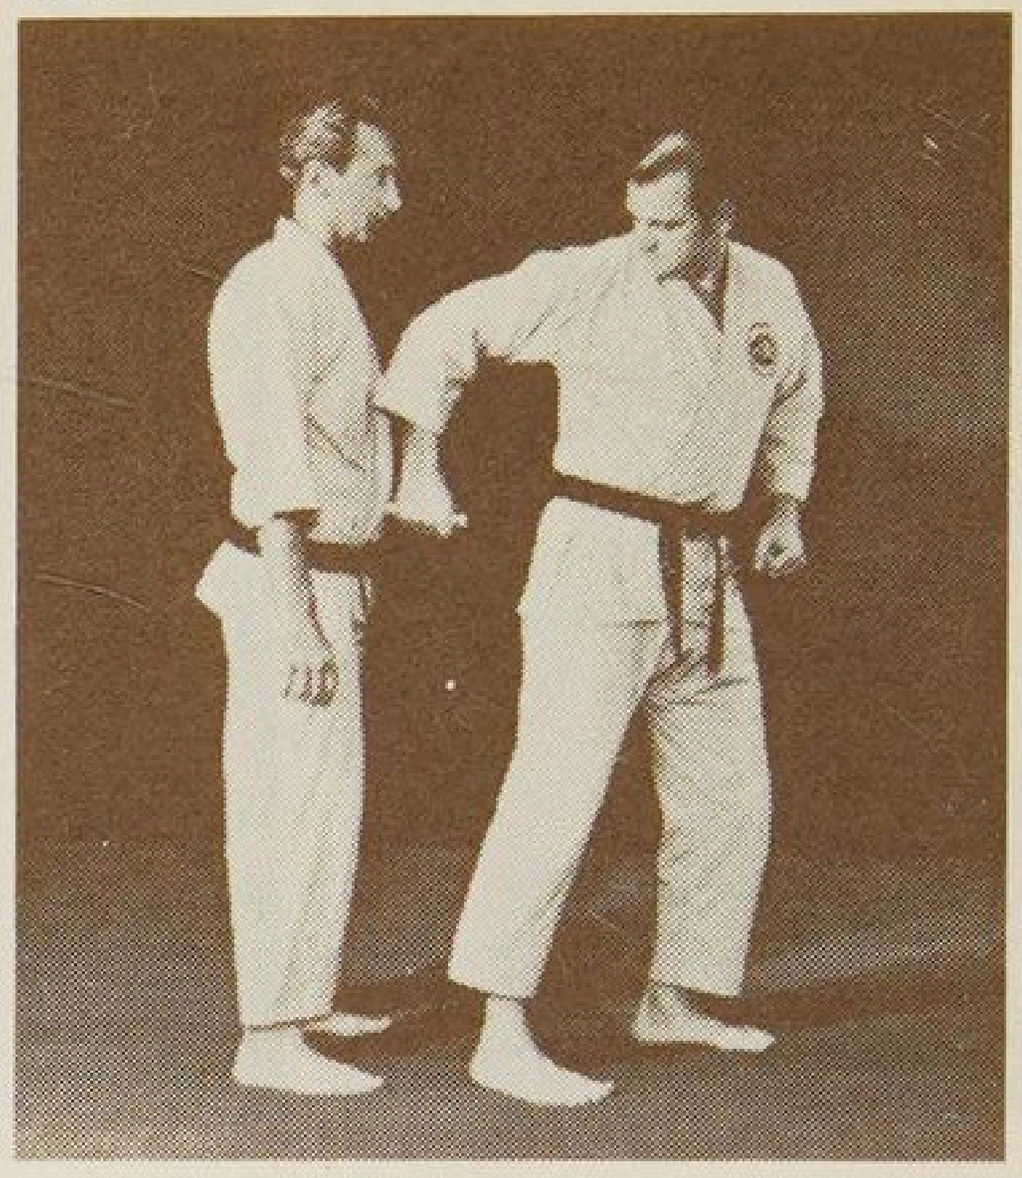
655. With the tip of the butt onto the shoulder muscle.

656. The side of the point to the shoulder.

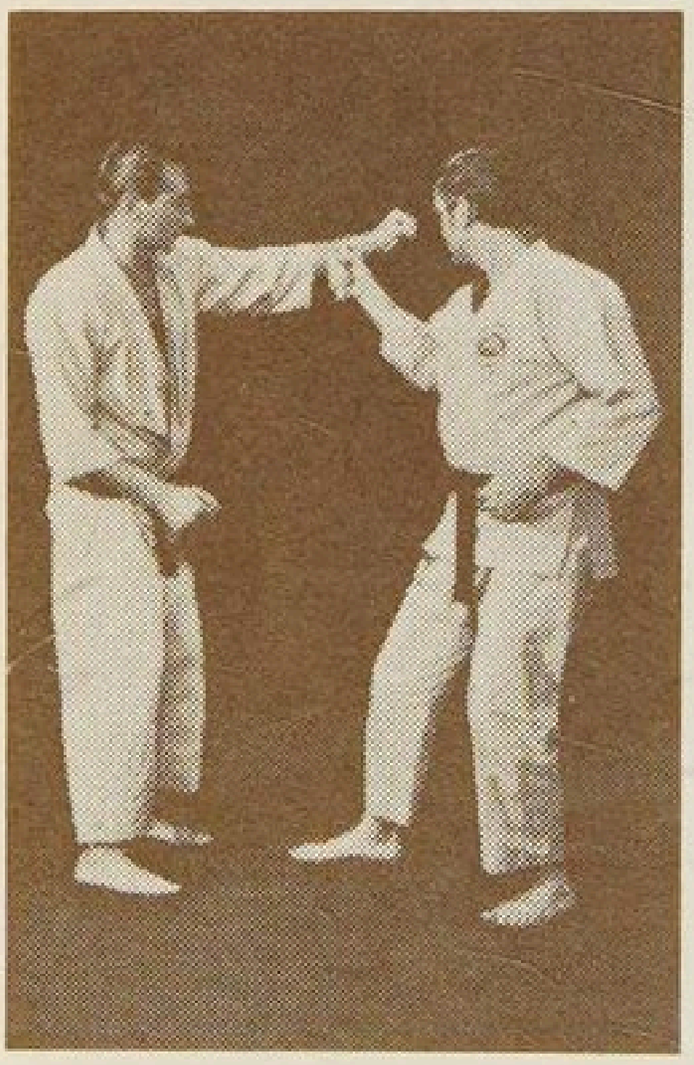
657



658



659



660

661

Rear Combination

657, 658. Using a backward jamming action, strike with the point of the yawara stick; without hesitation, reverse the arm movement and strike into the middle area with the butt.

Fist Defense Routine

659, 660, 661. The first two blows are into both arms of the opponent, in quick succession, followed by a retaliatory blow into the midsection.

HOW TO HOLD MEDIUM STICK OR BATON

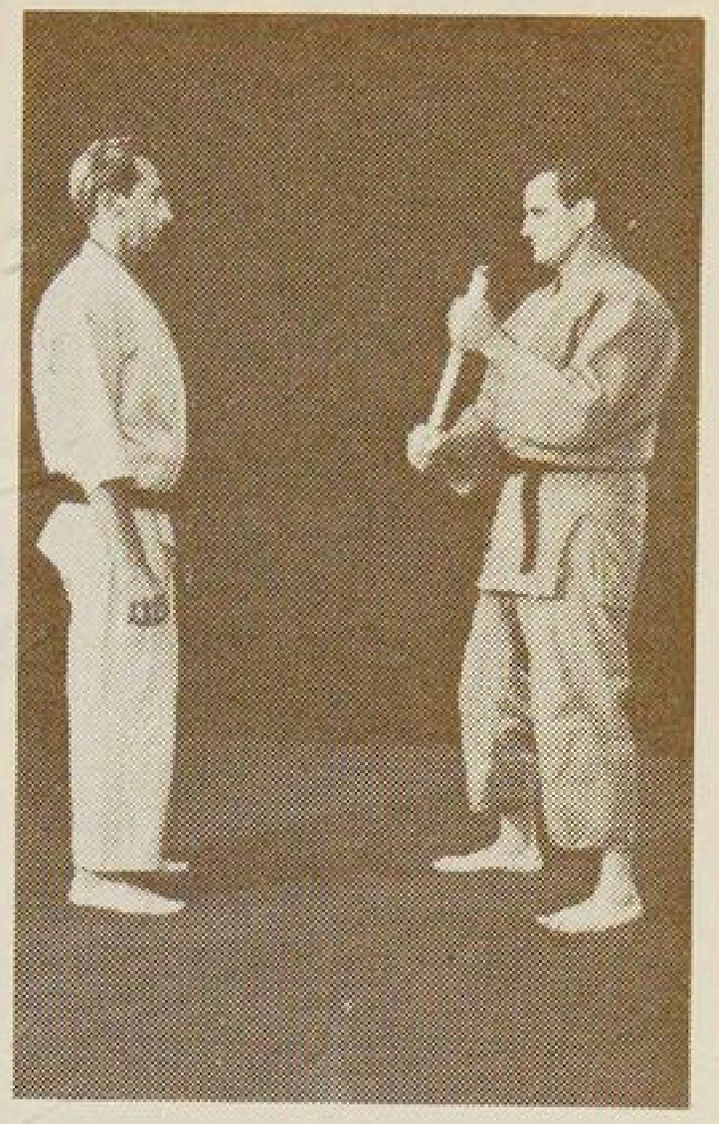
Left man is simply a point of reference in these photos.

662. Ready position Number One is with the stick held close to your body, as shown. This position does not indicate an aggressive attitude, though it clearly shows readiness.

662

663

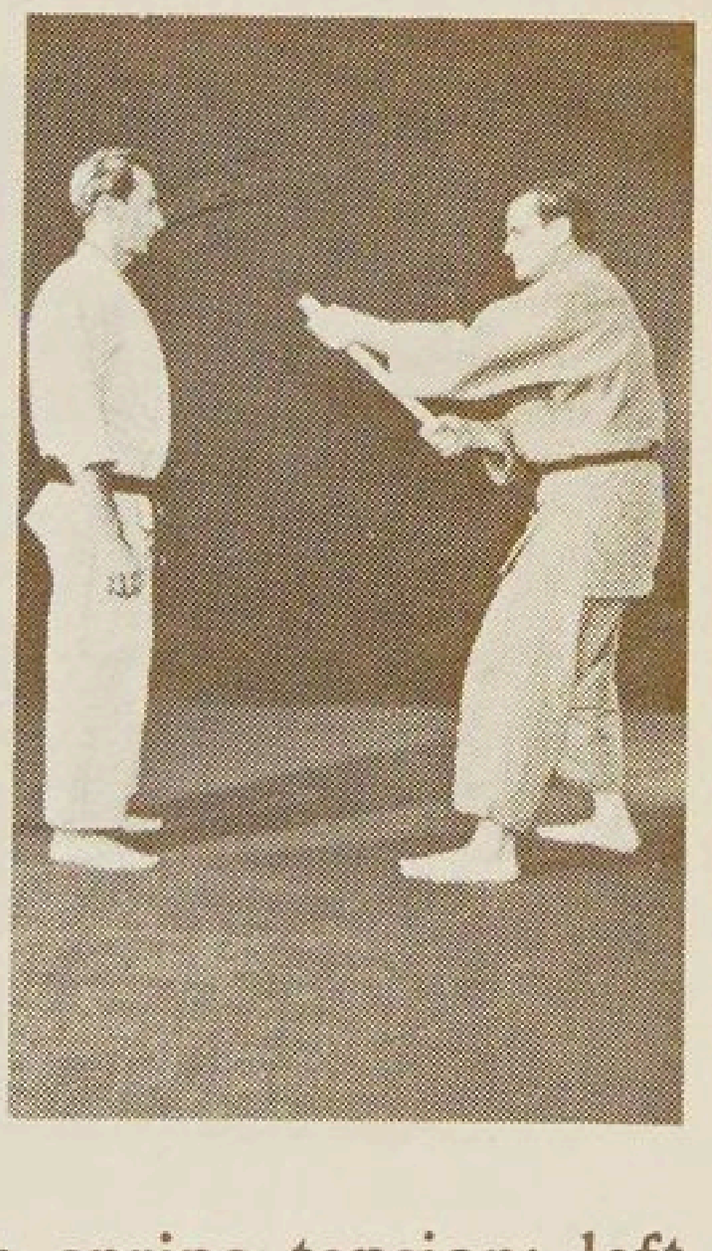
664



665

666

667



663. Number Two Ready Position is with spring tension; left hand, holding the tip and right hand holding the butt end; left hand pulls back as right hand twists forward, ready to release with added power of the tension.

664. The third ready position is High Port. The stick is held diagonally across your chest; it is a combination defense-attack position.

665. Fourth is the attack position shown, gripping the butt; tip is at face level.

666. Gripping the center of the stick with the tip at face level is the attack position number five.

667. Sixth position is a two-handed grip with the tip forward.

WHERE TO STRIKE WITH MEDIUM STICK OR BATON

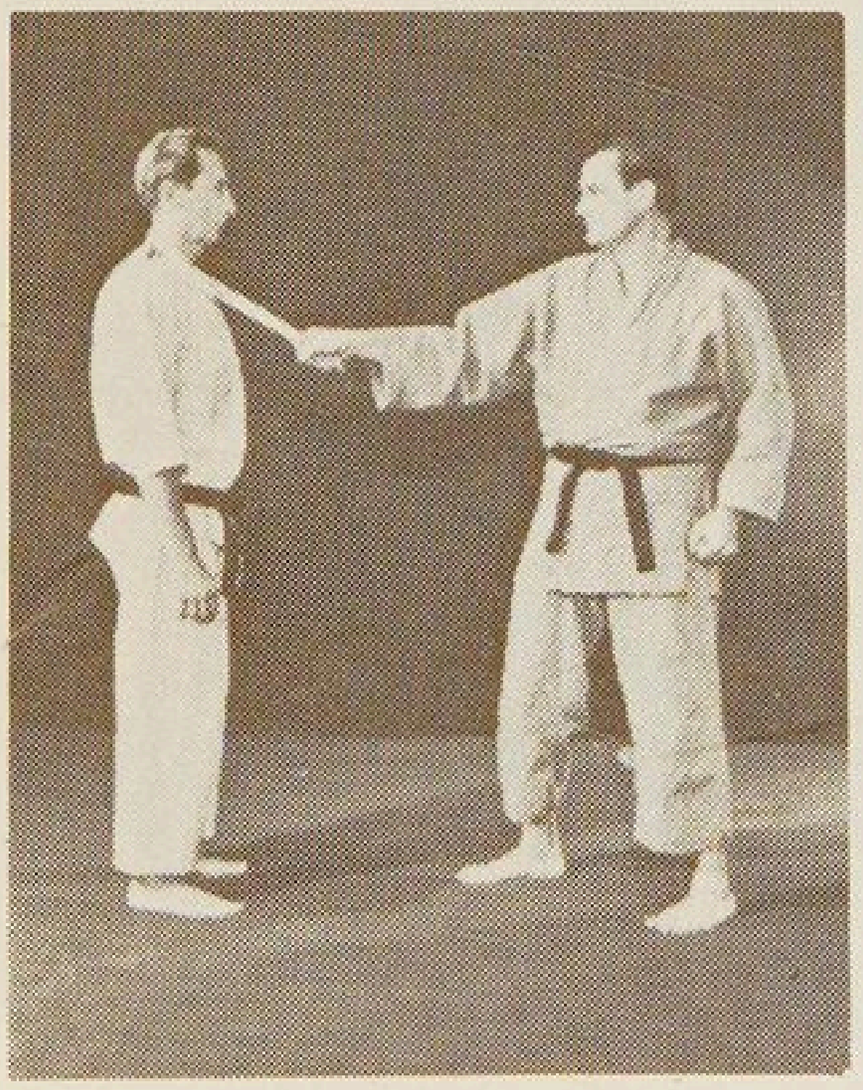
668. Onto the shoulder muscle, using downward snappy blow. The intent is to numb or immobilize the arm. Striking down onto the collarbone with baton can fracture the bone and is not necessary.

669. Onto the elbow, into the bend. Intent is to hit at the nerve, causing pain and numbness.

670. At the side of the knee, into the nerves, causing pain.

671. Using a jabbing action into the midsection. Avoid striking in an upward direction; there is danger of permanent serious injury to vital organs. When the blow is directed straight in, the resulting pain is great, but the danger of injury is not so great.

668



669

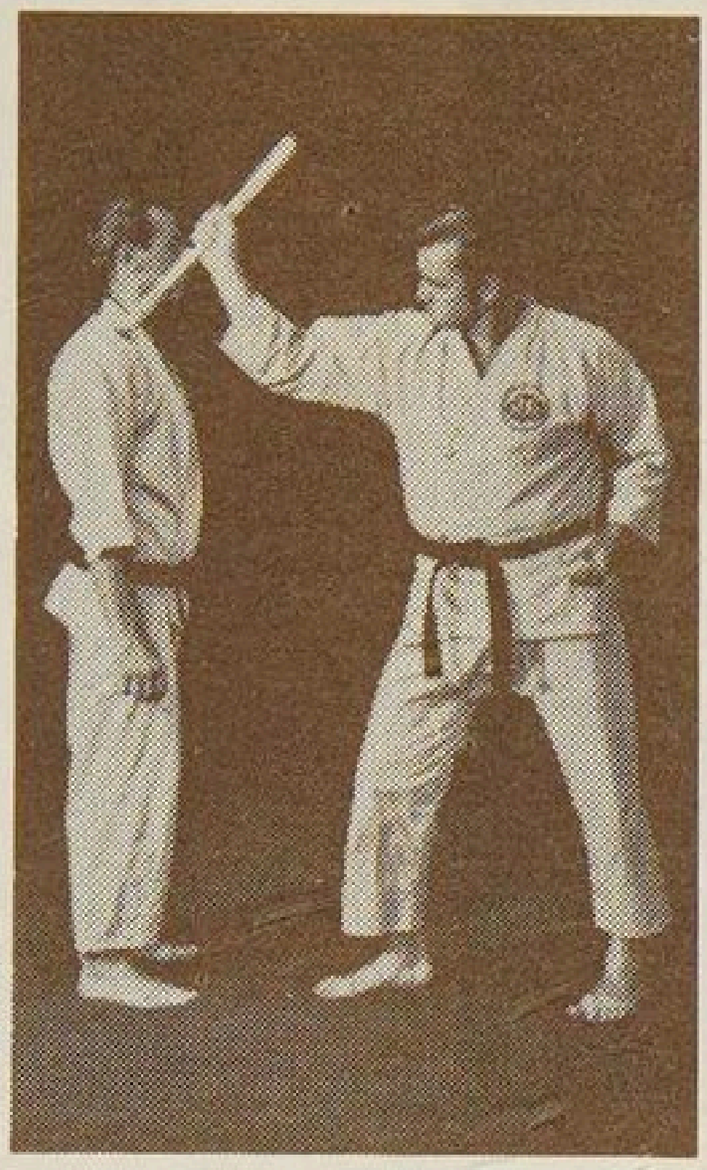
670

671

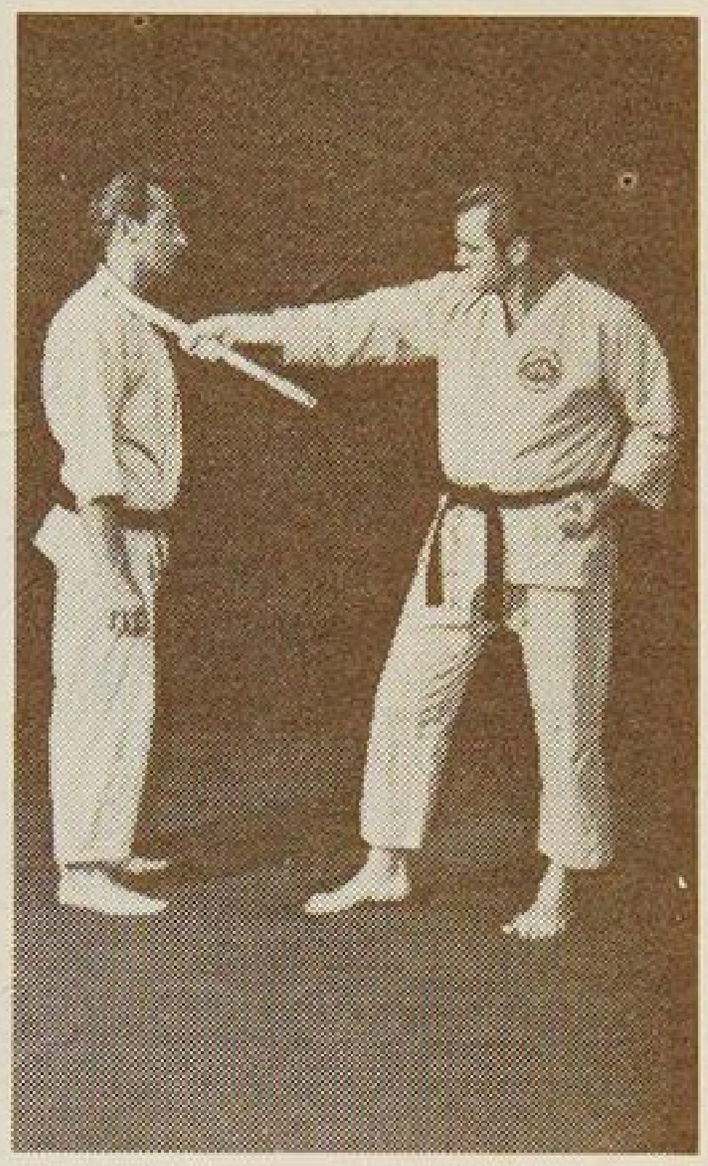
672

673

674



675



MEDIUM STICK (BATON) ROUTINES

Effective use of the stick for self-defense depends on the ability to use several blows in combination, in quick succession. Which combination is used will depend on the situation, which body target is exposed, and which types of stick blows are preferred by the individual student. Here are two examples of combinations of stick blows which are to be learned as shown for the test. For actual defense use, you must practice to respond quickly and appropriately to many situations with a variety of combinations as required.

One-Hand Routine

672. Holding the baton with one hand at the center of the stick, strike forward into the middle area with the tip of the point.

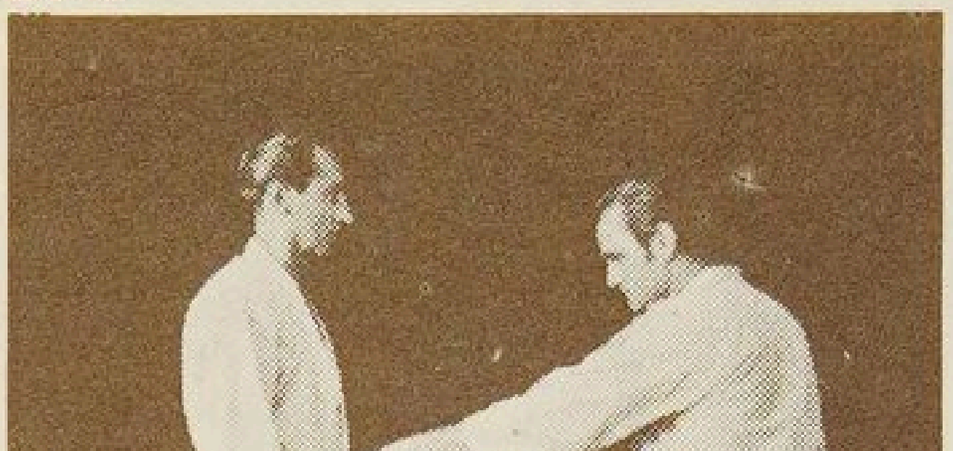
673. Without hesitation, with a rolling, upward movement, strike as though under the chin, using the side of the butt to hit.

674. This is followed by a downward blow onto the shoulder muscle with the tip of the butt.

675. Using a snappy wrist action, finish with another blow onto the shoulder muscle with the side of the point.

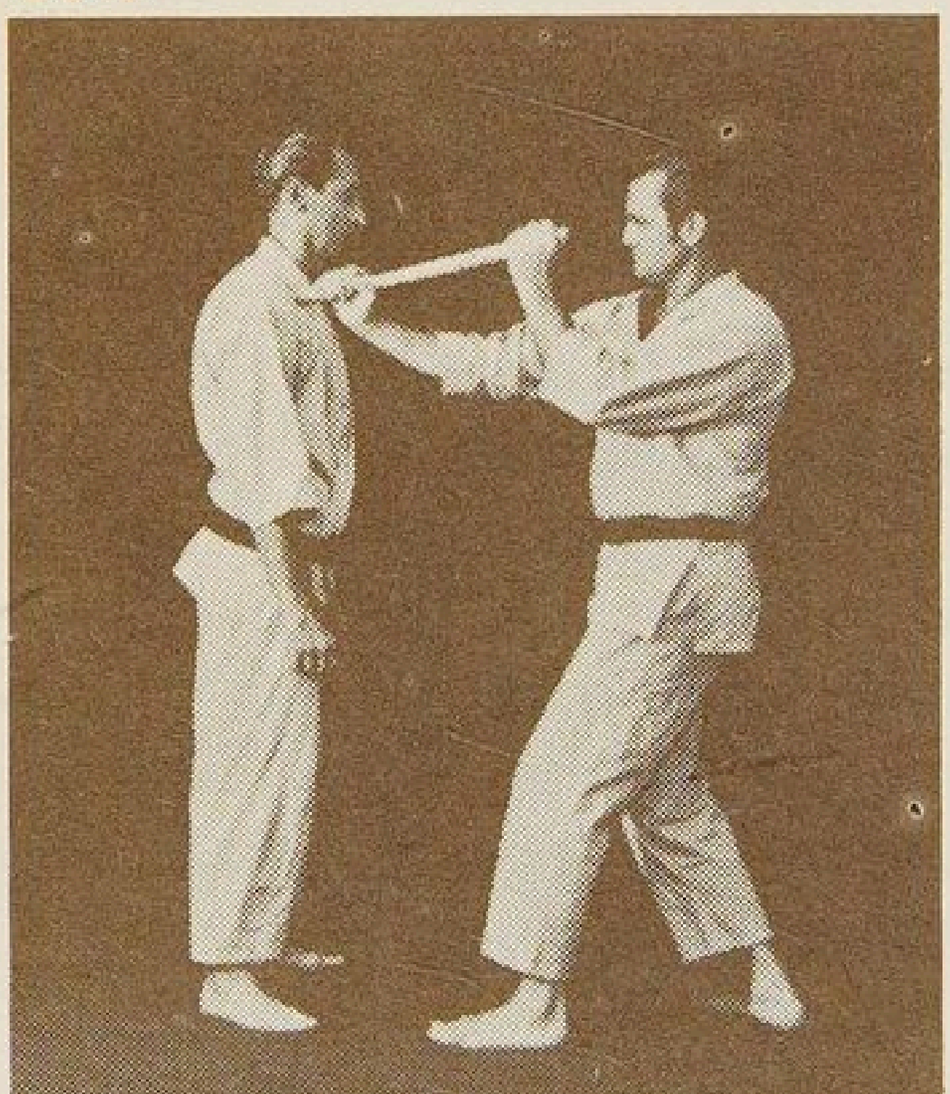
All blows are, of course, simulated, and are executed with smooth, flowing motions and good control.

676

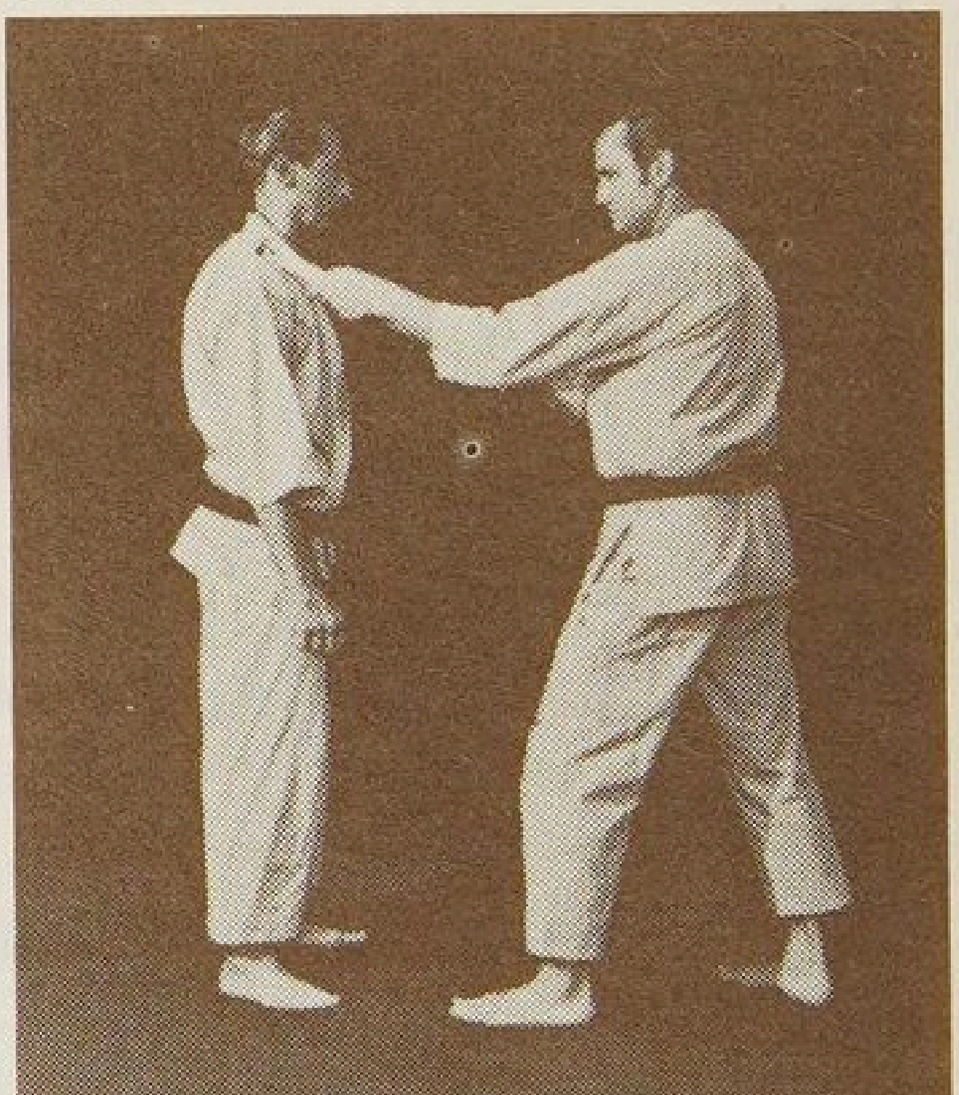


677

678



679



Two-Hand Routine

676. Holding the baton with both hands, as shown, start with a thrust into the middle area using the tip.

677. . This is followed by an upward blow into the middle area using the side of the butt.

678. Simulating jabbing action, strike into the shoulder muscle.

679. Finish the routine with another blow onto the shoulder muscle using the side of the point.

All motions should be smooth and flowing, with good control.

CREATIVE ADAPTATION OF STICK FIGHTING FORMS

For the black belt test, the student is required to demonstrate original forms using the small and medium (baton) sticks. Five

examples of each are required and each routine includes: Stopping the attack, retaliatory blows, placing adversary on the ground, restraint or subduing action on the ground.

As an example of the creative work done for this degree, here are two of the routines which were originated and demonstrated by Bob Rosenbaum for his Black Belt.

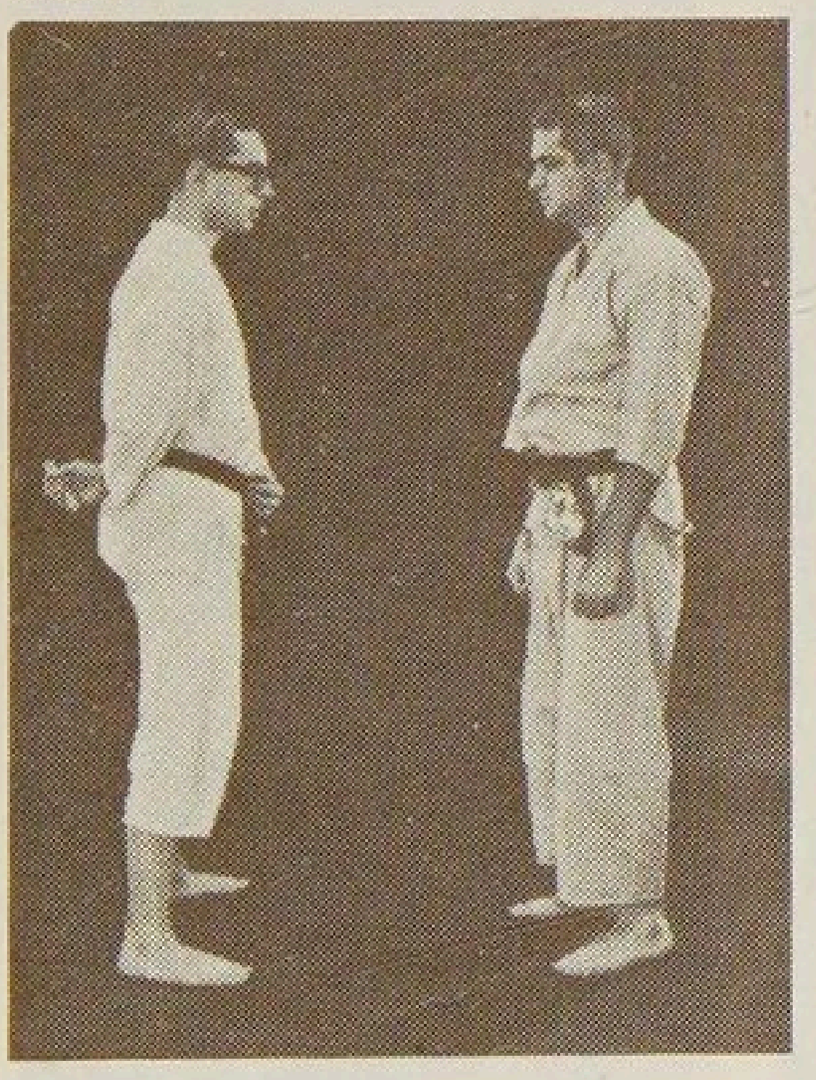
Yawara (Short Stick) Routine

680. Bob Rosenbaum, shown left, begins routine holding short stick in concealed, non-aggressive position.

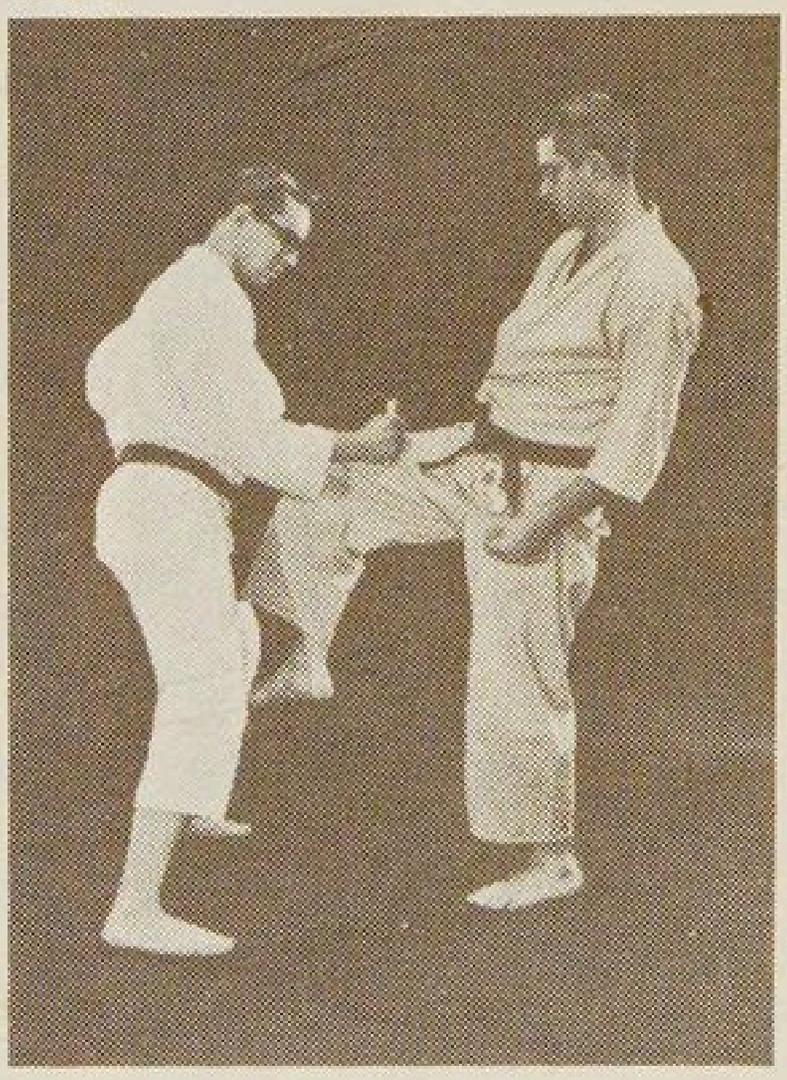
681. At the cue of simulated attack, knee kick, he strikes into the side of the knee.

682, 683. Without hesitation, the next blow is into the midsection followed by a blow into the neck.

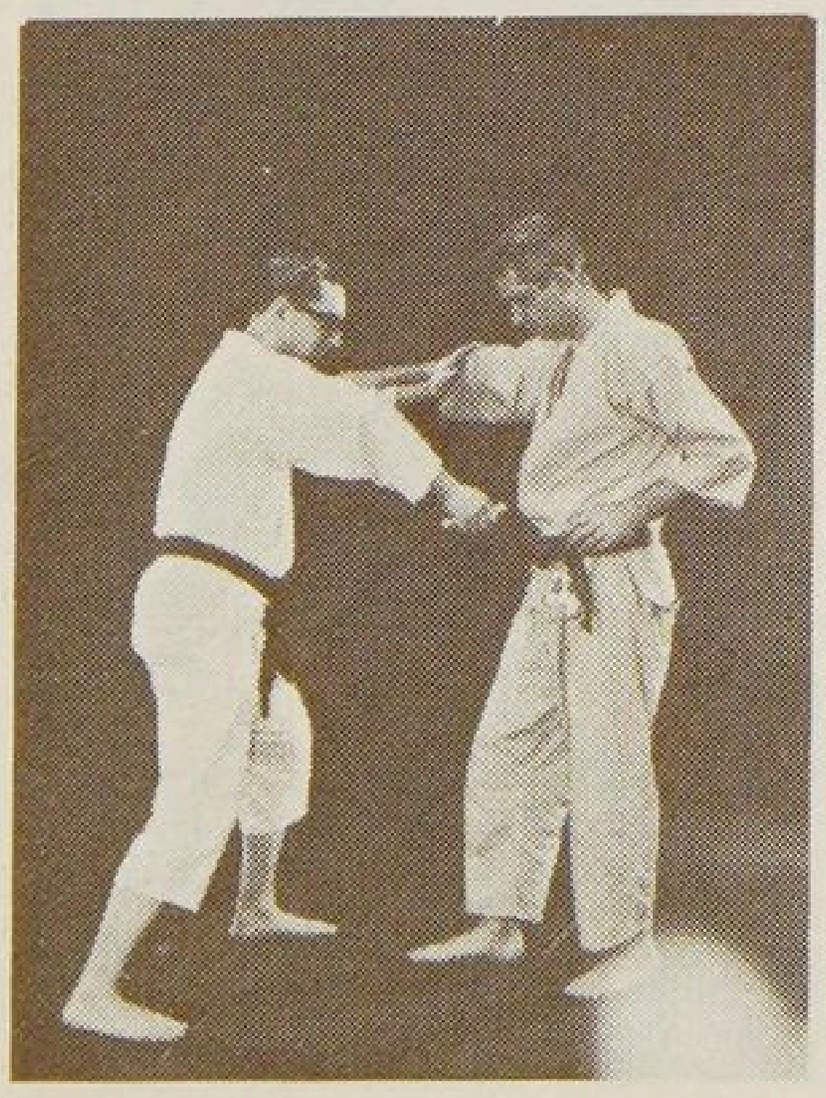
680



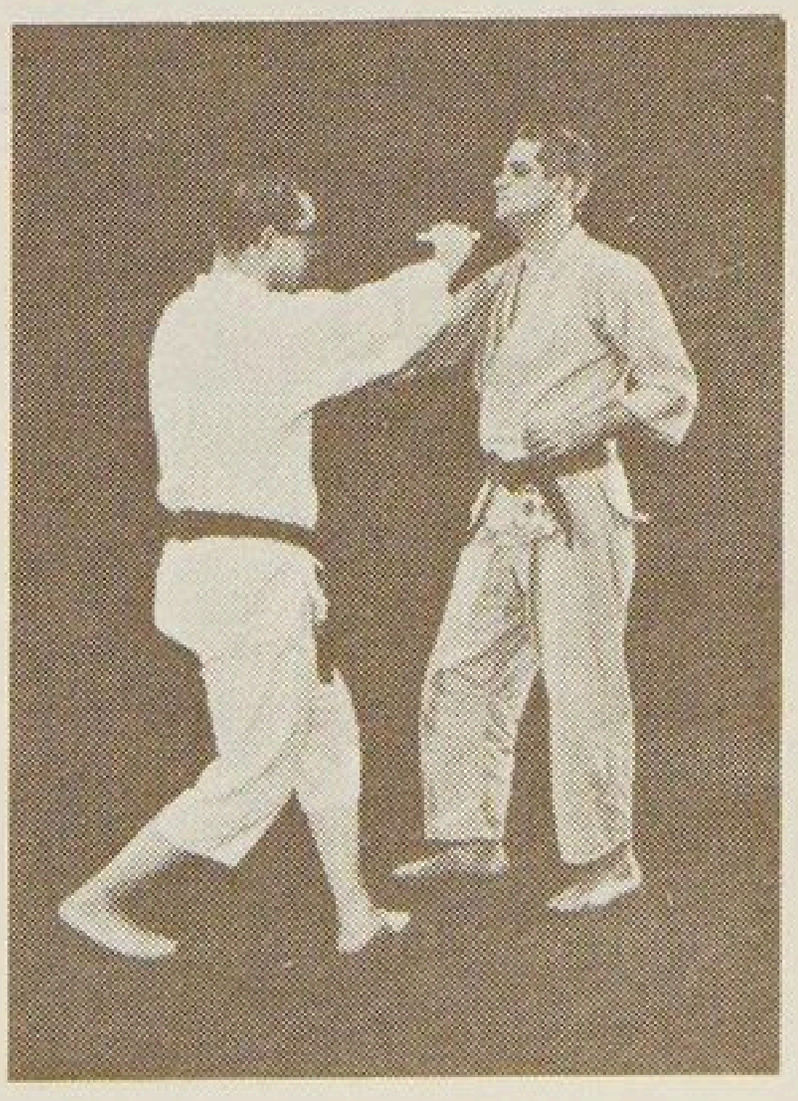
681



682



683



684. He takes an over shoulder throw position with his arms and pivots in.

685, 686. Instead of applying over shoulder throw, he executes a leg throw.

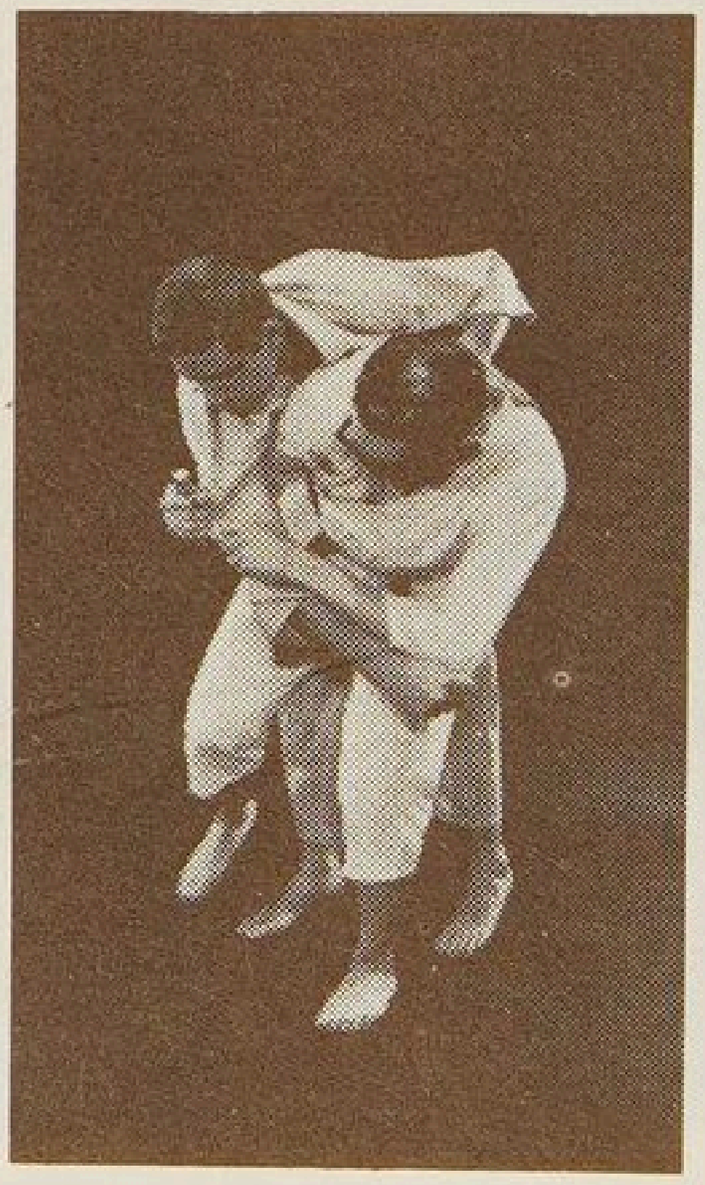
687. He simulates the ending blow.

Baton (Medium Stick) Routine

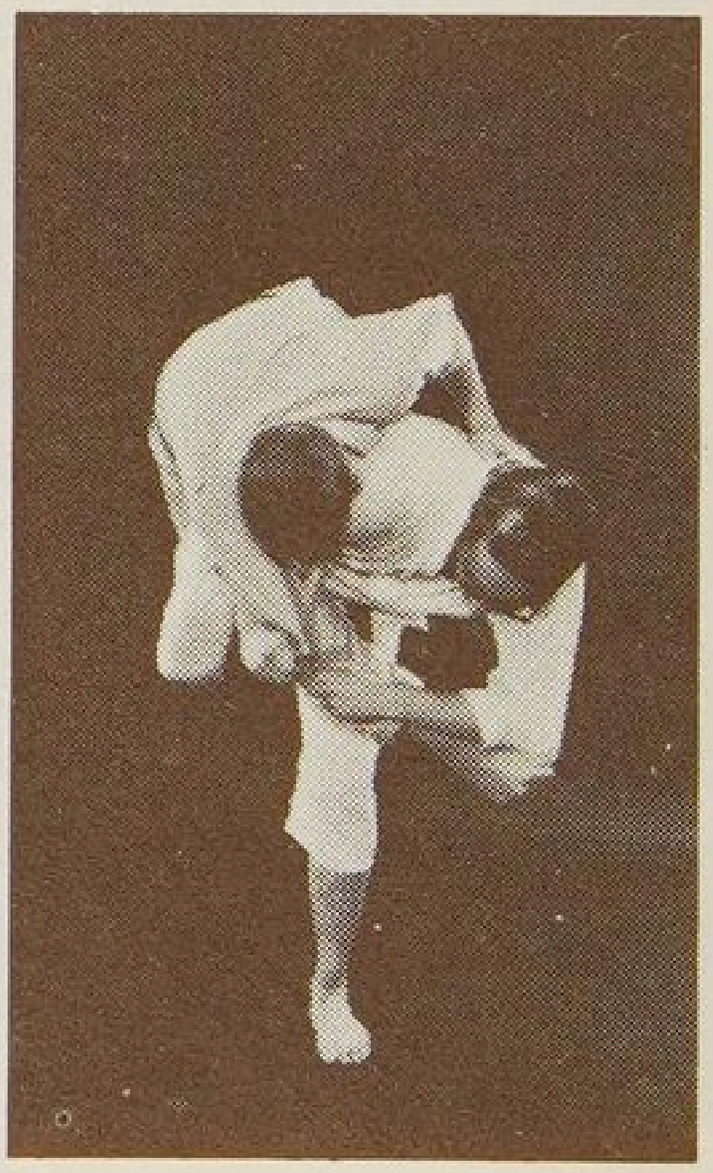
688. Bob Rosenbaum, shown left, begins the form in a non-aggressive stance with the stick concealed.

684

685



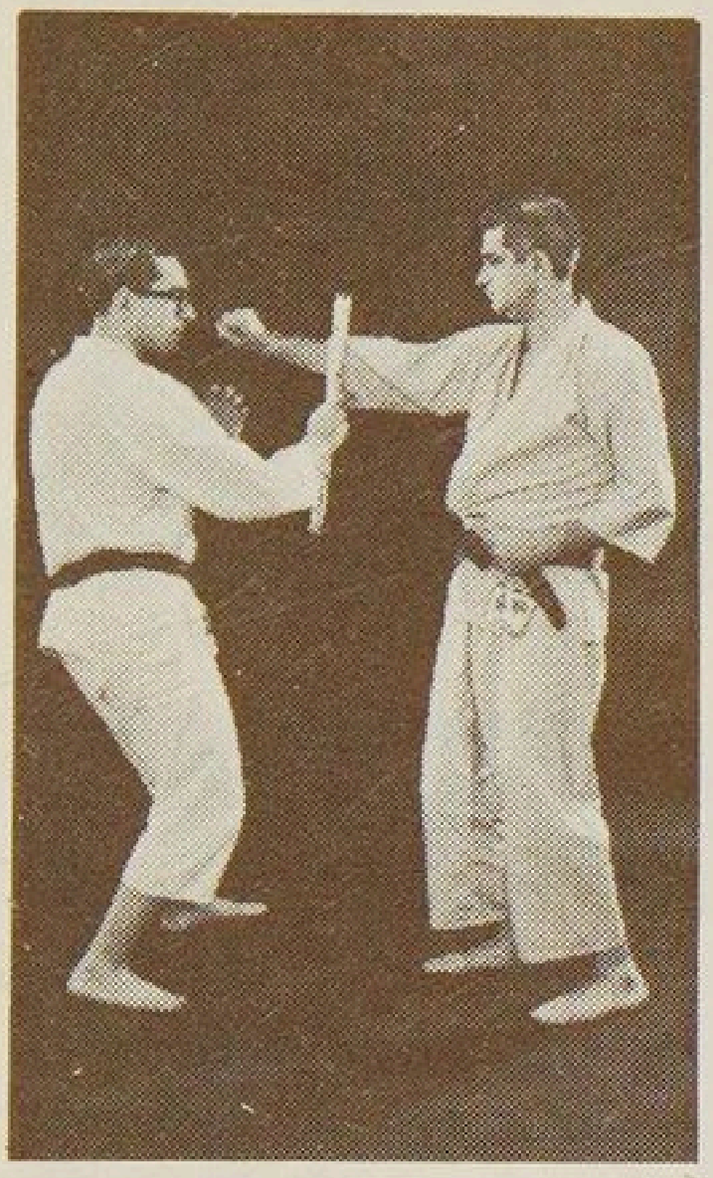
686



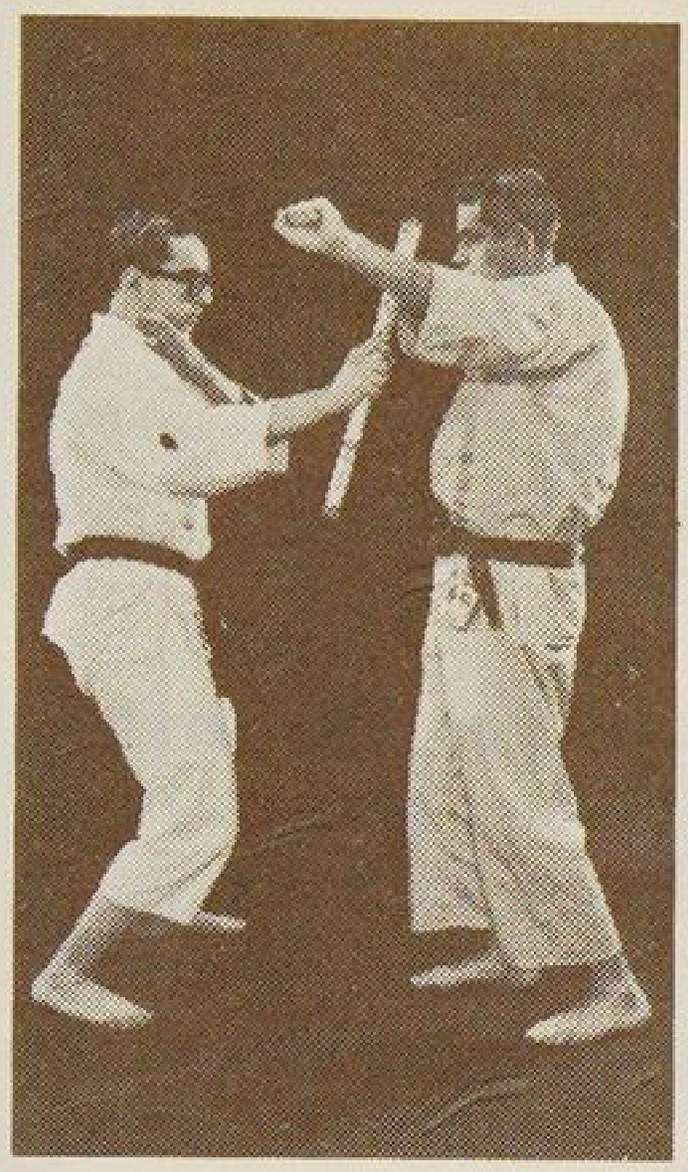
687

688

689



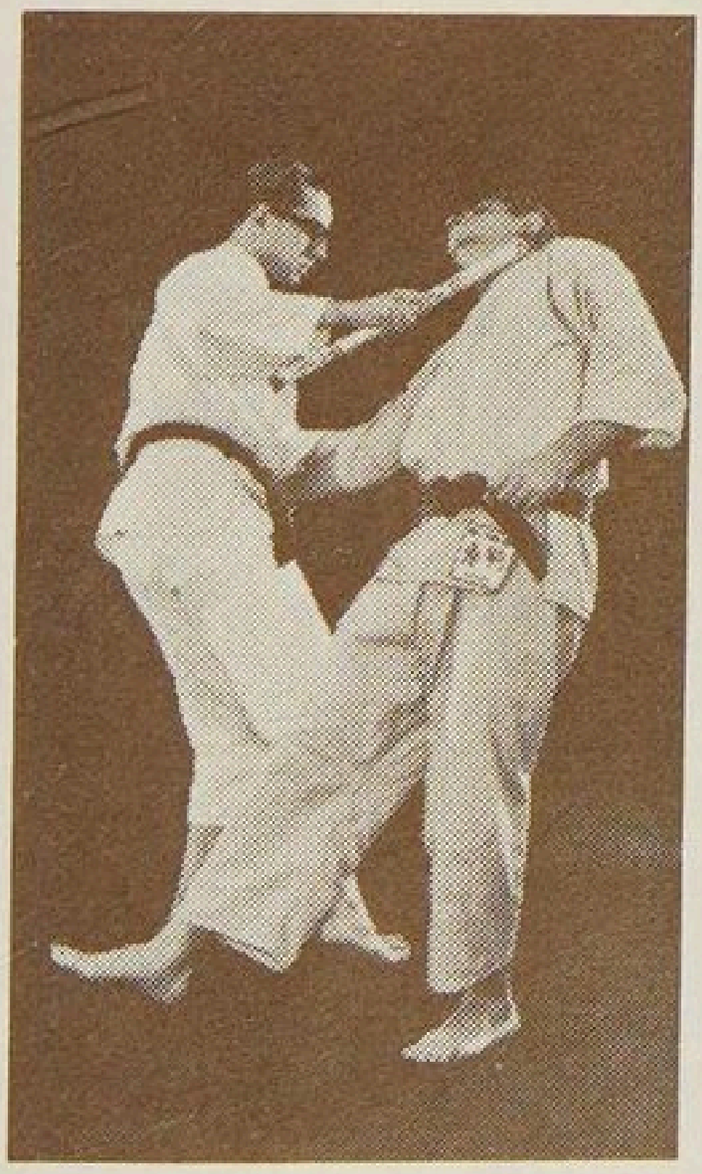
690



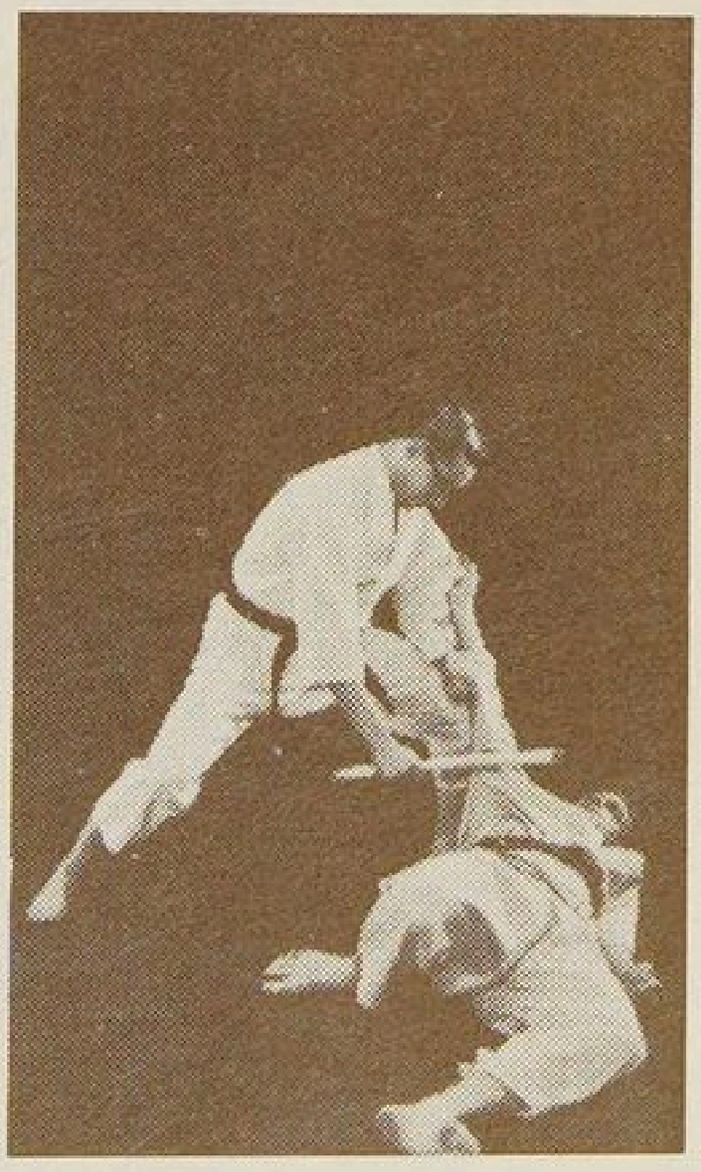
691

692

693



694



689, 690. At the cue of a punch, he strikes into the arms, blocking them.

691. Without hesitation, he strikes into the midsection.

692, 693. He executes a kick back throw, using the baton at the side of adversary's neck as a lever.

694. With opponent on the ground, he braces his knee into the captured arm as he delivers ending blow.

SPONTANEOUS DEFENSE AGAINST UNREHEARSED ATTACK

Four Unarmed Assailants

This is an example of response to unrehearsed attack situation in which the student taking the test for advancement is not told beforehand how the attack will be made, in what order the attacks will be simulated, or from which direction they will come. What is being tested here is the quickness of response and the ability to react appropriately.

695 to 703. In these photos, the student is confronted by four unarmed assailants. Defender, shown right, makes the first move, attacking one of the end men with a kick. He then follows the most efficient plan allowed in this kind of situation: he attacks, pushing that man into the nearest opponent and attacks the next available man, whom he then pushes into the nearest opponent and so on, until he has disposed of all four assailants.

706

Three Armed Assailants

The three people who simulate the attack in this portion of the test use knife, club, and chain. For safety in practice, do not use a real knife or chain. Following is an example of good response to this kind of situation. This is not necessarily the *only* proper response, which must of course be determined by the specific and unique situation which actually presents itself; but this *type* of response works best. By taking on the club attacker first, since he is the only one who can safely be blocked, he can be used as a shield against the others.

704 to 714. Faced with three assailants who simulate simultaneous armed attack, the defender moves in, blocks and attacks the club man, uses him as a shield and pushes him vigorously into the other opponents. He then carries on his kicking and pushing plan,

using one of the adversaries as a shield against the other and moving rapidly to the outside and alternating his kicking attacks as quickly as possible.

JUDO SPARRING

The requirements for jukado black belt degree include three separate types of sparring demonstration. Unlike the degrees for judo, karate, or aikido, the student is not expected to enter contest and win points in a tournament. However, he is expected to understand the theory and be able to demonstrate how sparring is done in each of three different arts. Good technique is the important objective; partner's resistance should be geared to "light" practice sparring. In "heavy" resistance, as in contest, the partners resist each other to the limit of their ability; in "light" resistance, the partners resist only when an attempt is not clear and sharp. That is, they do not "fall down" for each other at the mere indication that a throw is being tried, but offer just enough resistance to demonstrate that successful throws are being applied.

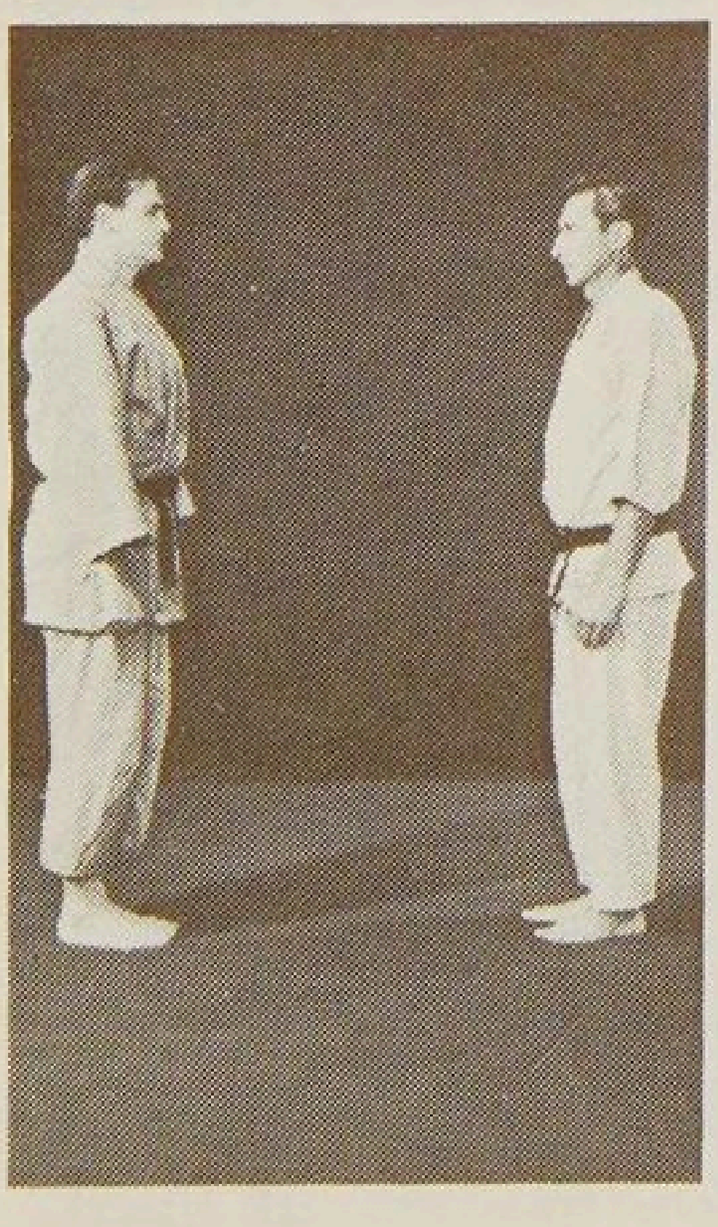
All three types of sparring begin with the minimum ceremony of:

715. Standard starting position, facing as shown, but partners should be about 12 feet apart.

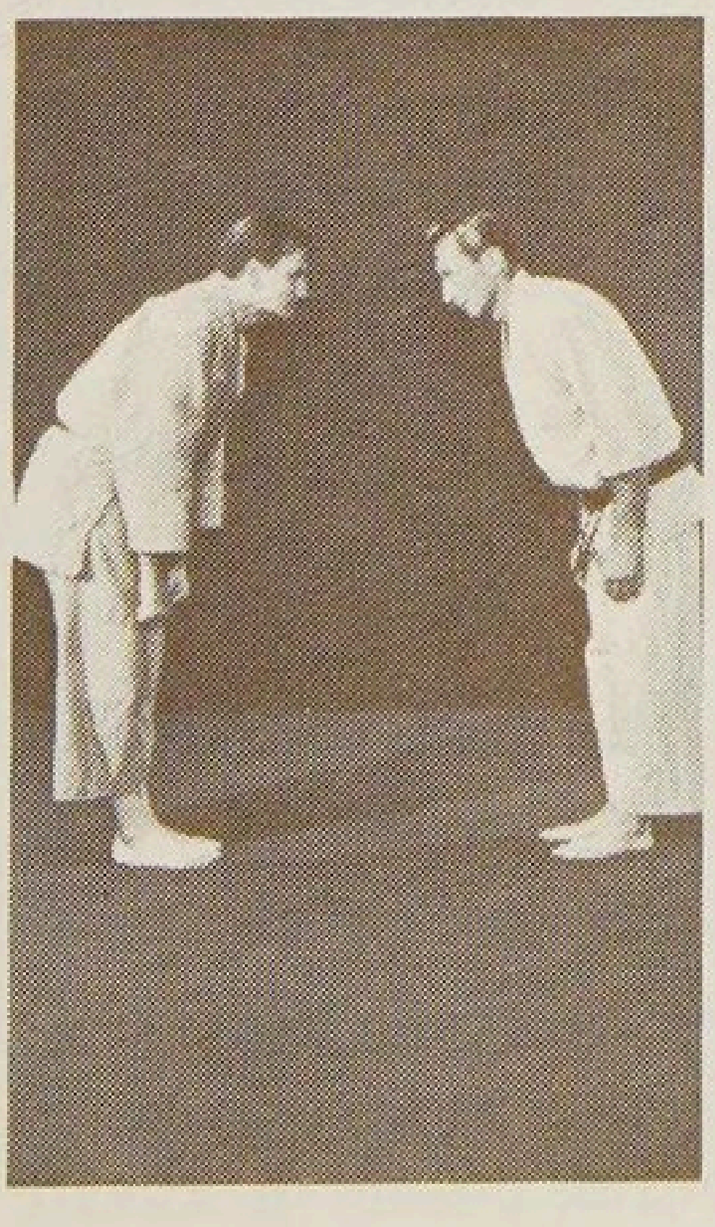
716. They bow in unison, then return to starting position.

717. For judo sparring, partners move in after the bow and grasp in standard judo fashion.

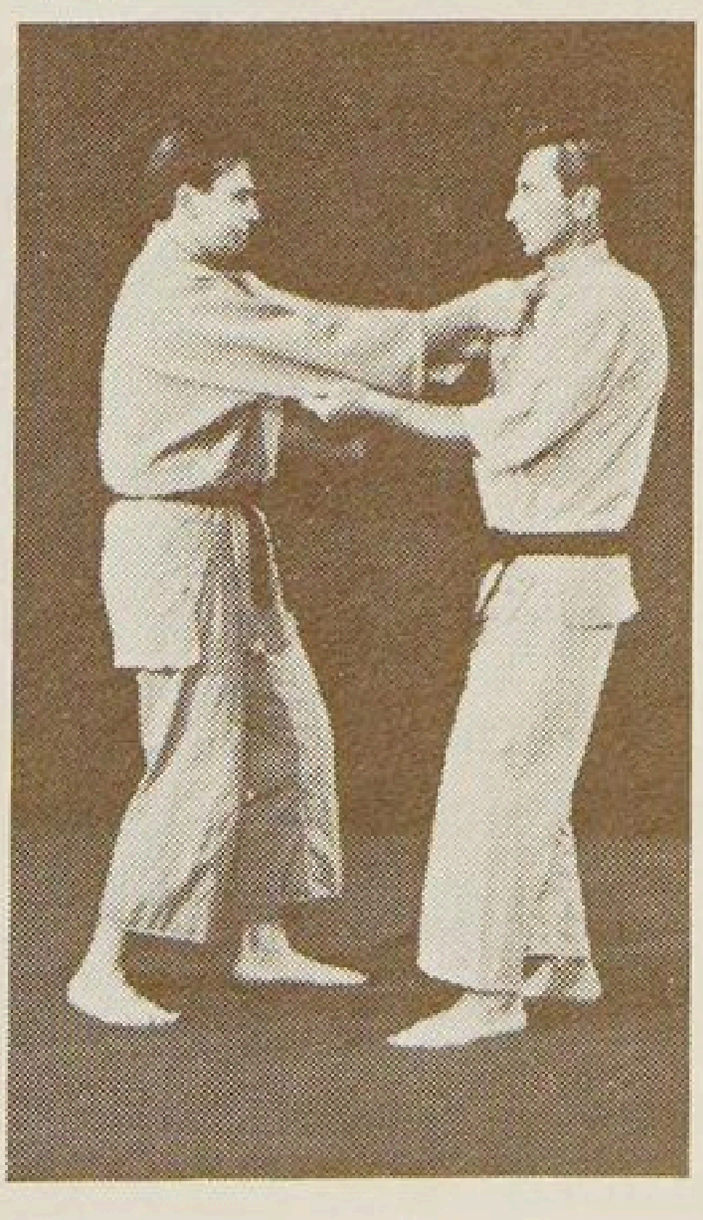
715



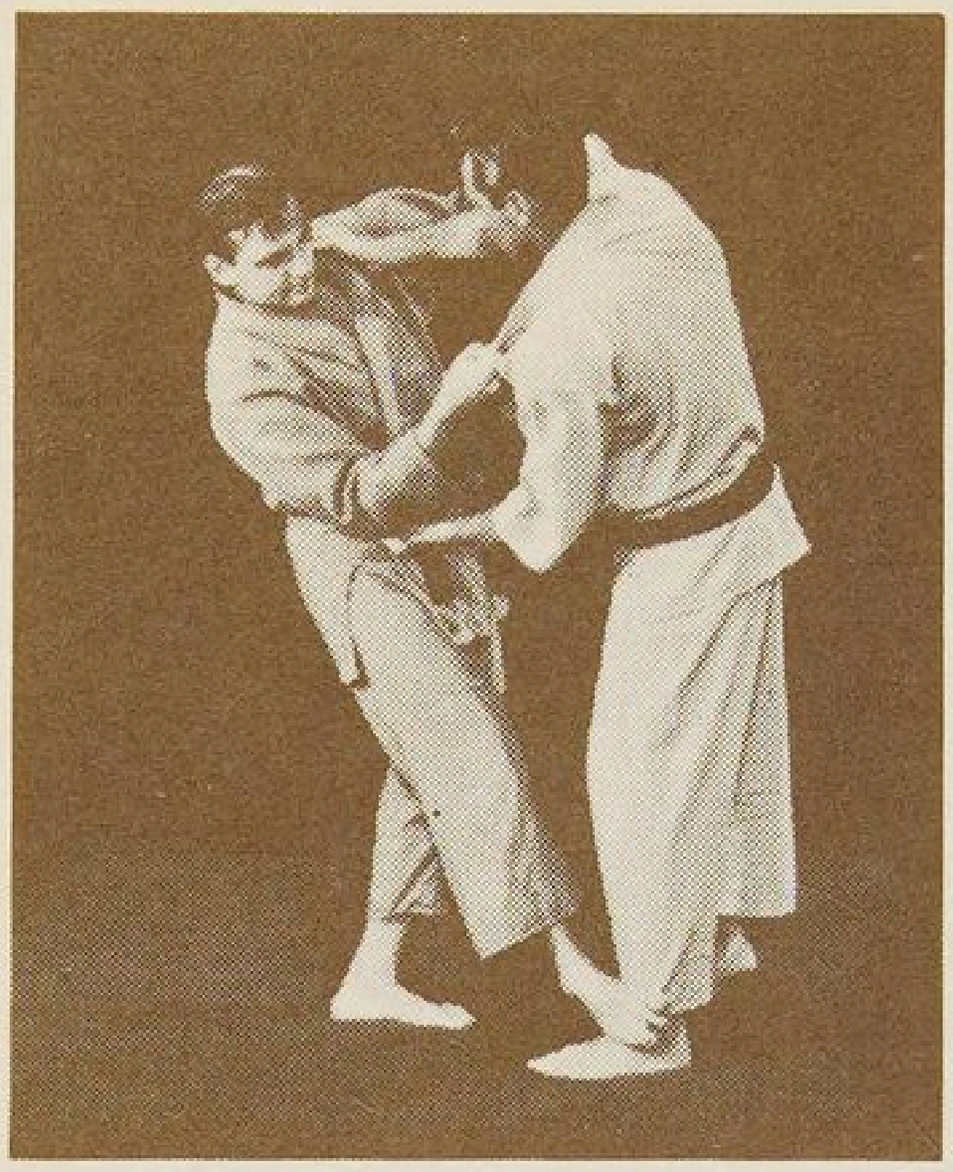
716



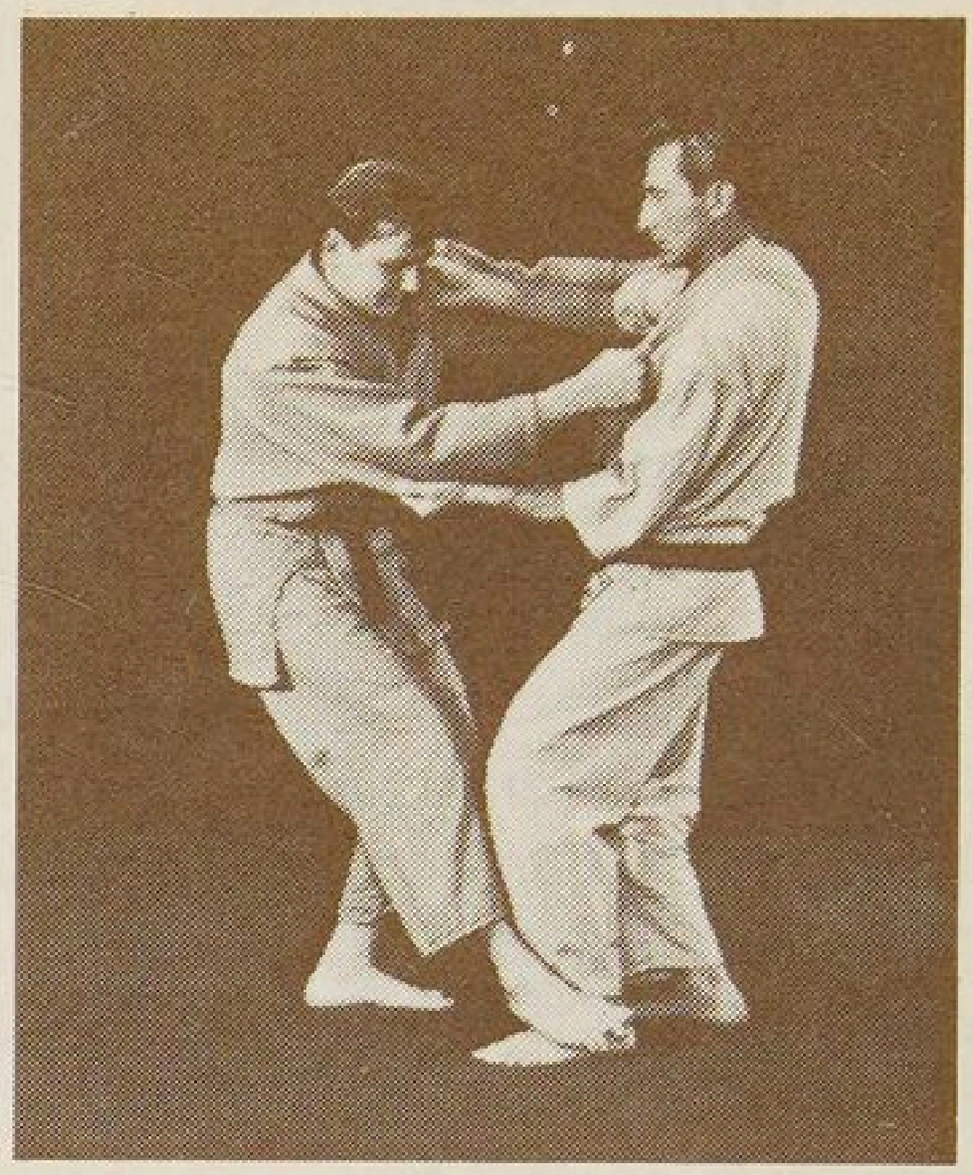
717



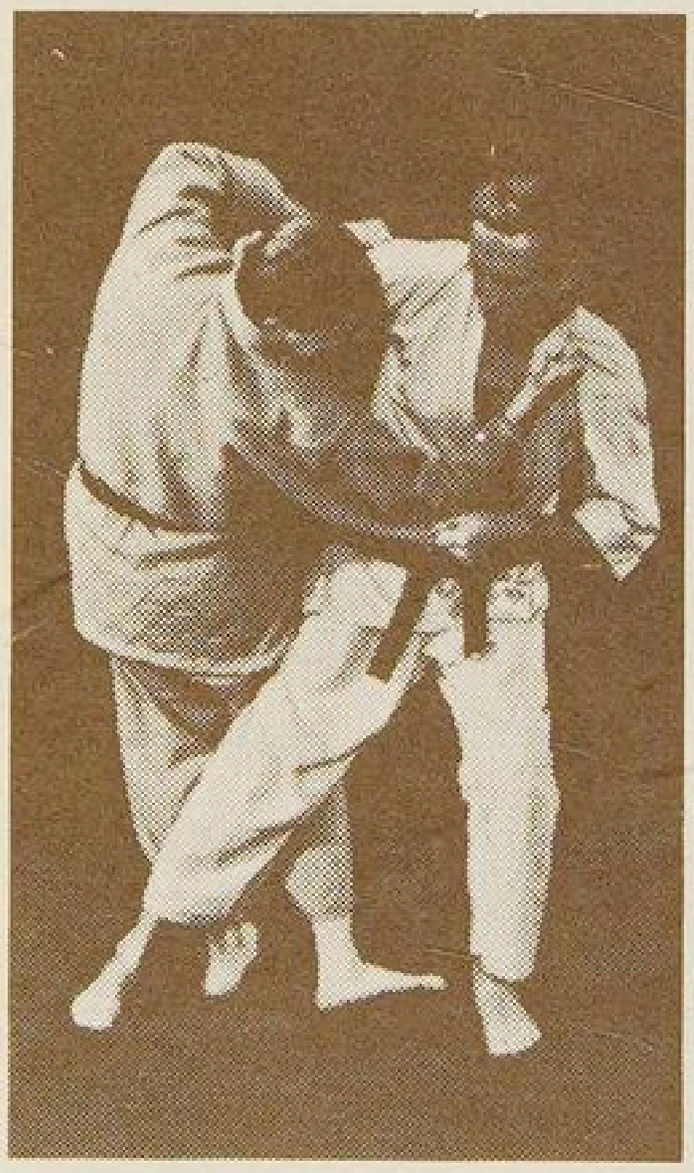
718



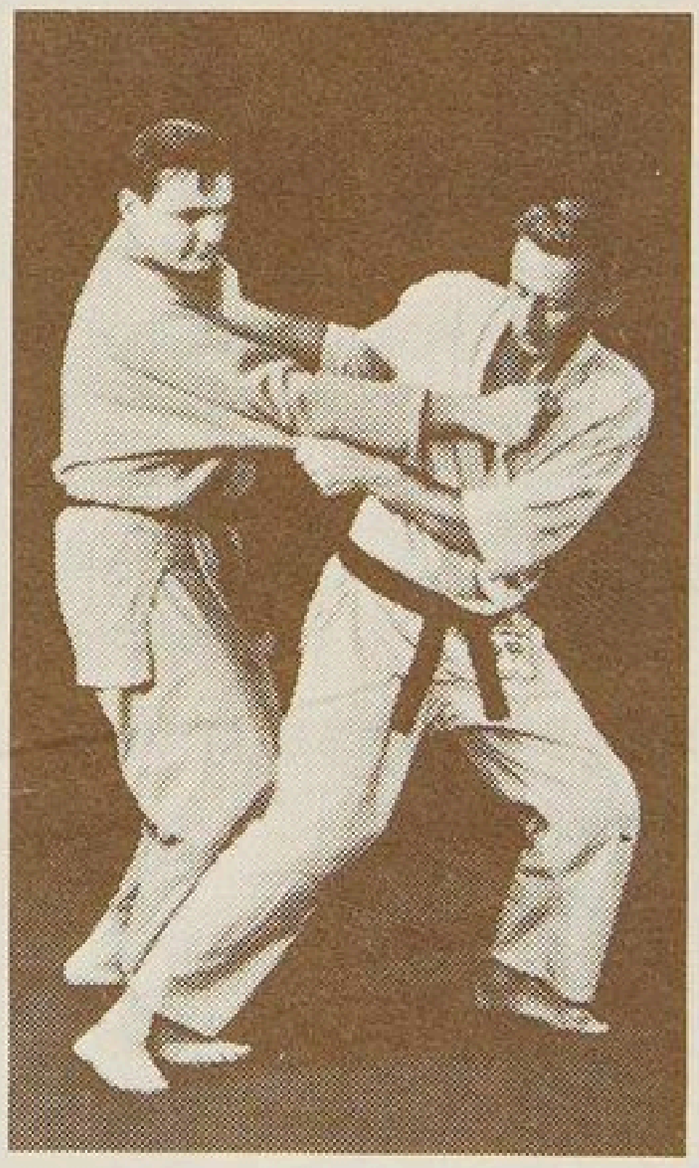
719



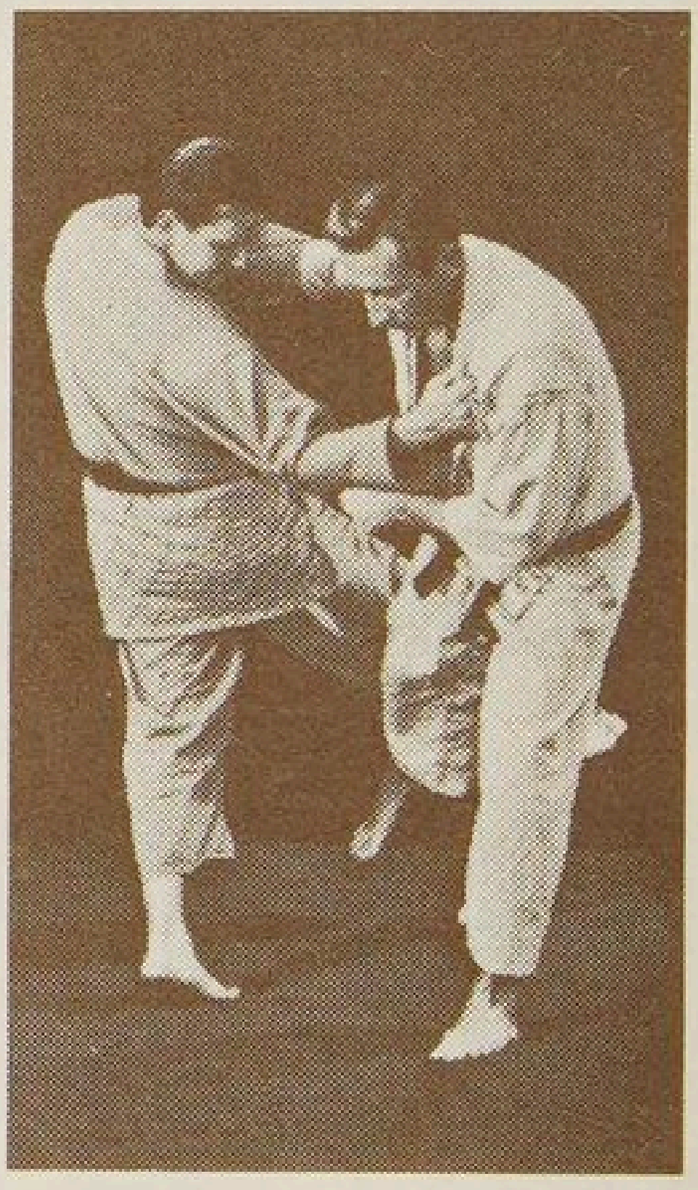
720



721



722



718 to 722. These photos merely show an example of possible judo sparring actions. Of course, there are literally thousands of possible combinations of throwing attempts, blocks, counters, throwing techniques, and combination throws which are used in judo sparring.

Left man attempts a throw, which is blocked by right man who then attempts a counter-blow. When the counter-throw is blocked, he applies a second throw.

The time for demonstrating judo sparring ability in the test should not exceed two minutes.

KARATE SPARRING

The three elements of karate sparring are: The ability to attack, ability to stop an attack, and ability to counter-attack. Though the student need not win contest points in karate tournament, he must,

in the test, show that he has theoretical understanding and practical ability in the art.

The demonstration begins with the ceremonial bow, then both partners assume fighting stance of their choice, 723.

Following are examples of techniques demonstrated in karate sparring.

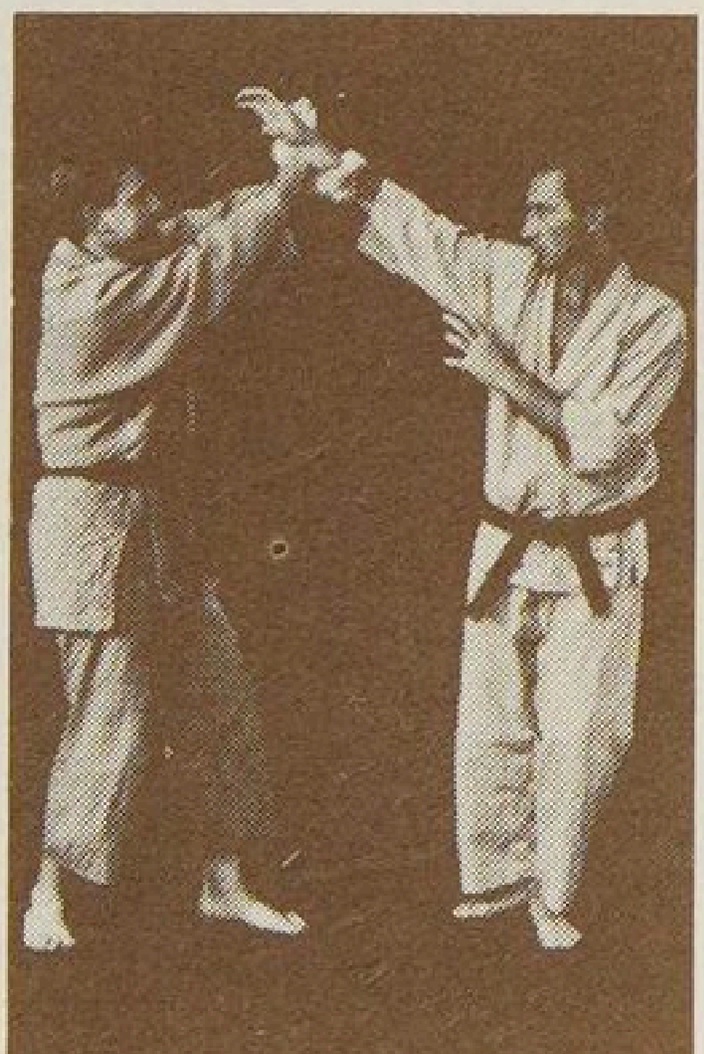
724, 725. The high hand blow here could be meant as an actual attack or as a feint. The high blow being blocked, there is a follow-up kick in this two-action sequence of combination attack.

726, 727. This is an example of attack and counter-attack. Left man attacks with high blow, which right man blocks and follows up with counter-attack.

For the test, time of sparring is from one to two minutes. The black belt examinee should be able to show his ability in a period of sparring not exceeding two minutes.

723

724



725

726

727

AIKIDO SPARRING

Though unnecessary for practical self-defense, aikido sparring ability is required of the applicant for jukado black belt rank . He must know more than the separate techniques; he must know how to use them in the flowing, rounded, classical manner which is characteristic of aikido. For the test demonstration, which is not to exceed two minutes, the student must demonsrate the ability to take aikido holds from a moving situation, he must be able to apply combination holds, he must show the ability to effect release and counter-attack. The resistance which is offered by his partner in the test is just enough to allow verification of skill. Rules of safety must be observed; partners must not resist with force. The photos following are examples of sparring.

728. After the bow, partners assume open-hand starting stances of their choice.

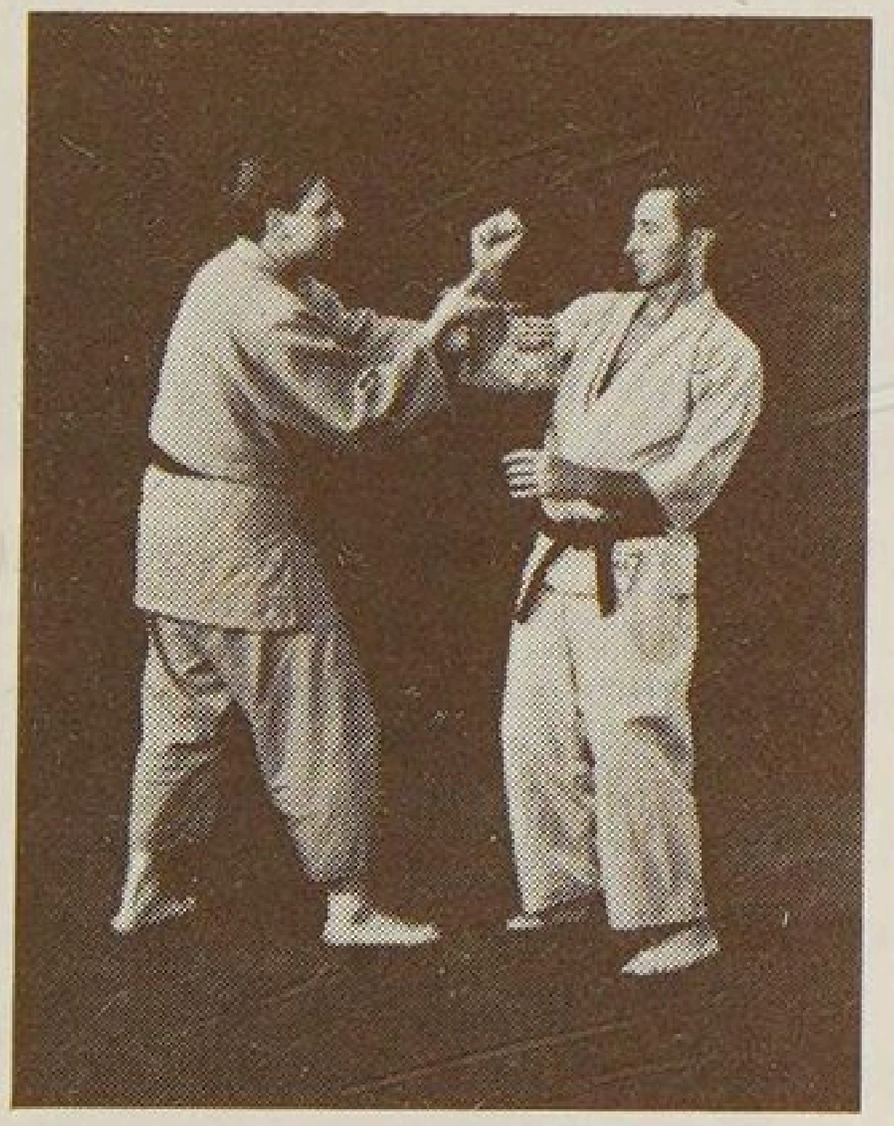
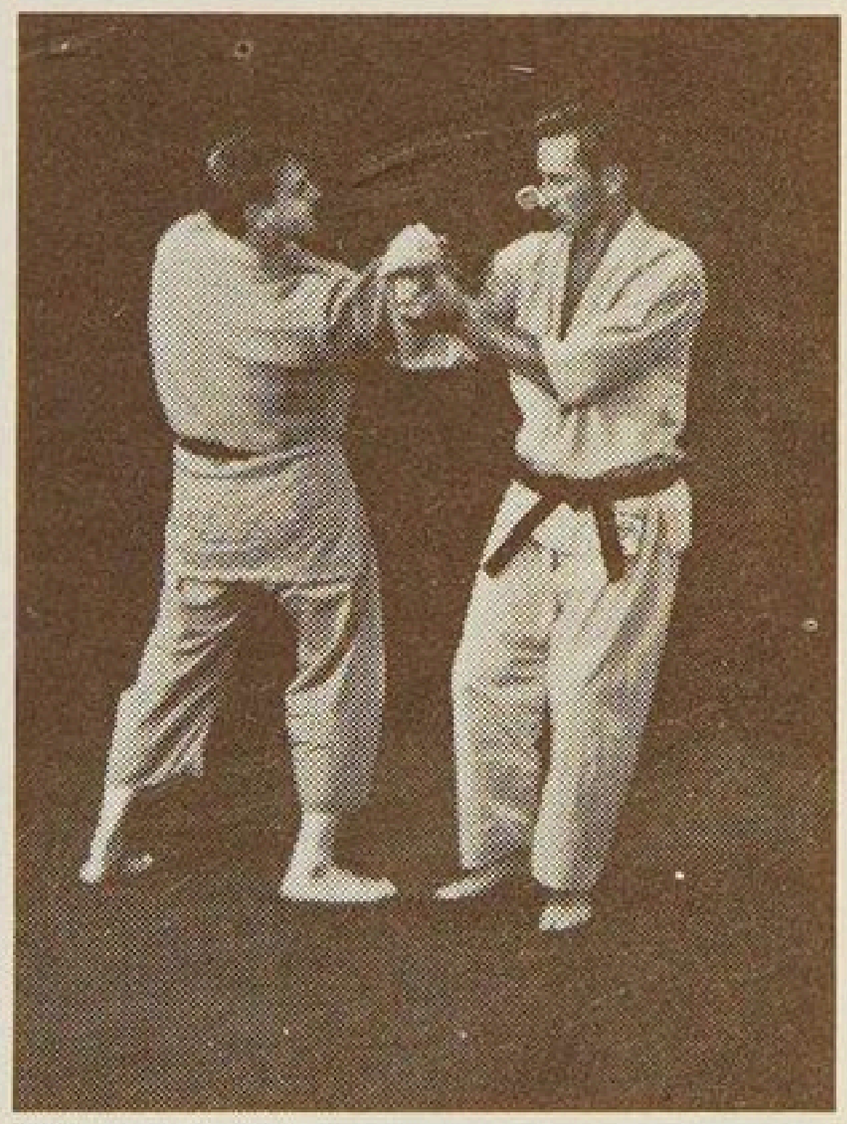
736



737



729. A single hold is taken.

730 to 733. This sequence shows right man attempting a hold which is opposed; he switches to the second hold, taking advantage of the counter-force.

734 to 737. Left man attempts a hold from which the right man escapes and then right man applies a counter-technique.

RESUSCITATION FROM ACCIDENTAL CHOKING

When all the rules of safety have been scrupulously observed, the possibility of accident is very slight; however, even when both partners take care, there still remains that slight possibility. People practicing jukado should have available to them the name and address of a doctor or an emergency resource in the event of injury. If you do not have such a resource, remember that your tele-

phone operator can quickly connect you if you speak calmly and give her the necessary information. Black belts should have basic knowledge of first aid and most communities offer Red Cross courses which you can take.

In addition to first aid knowledge, black belt rank holders ought to be familiar with these resuscitation techniques.

When accidental choking has rendered the subject partially unconscious, you can apply these techniques:

738. Loosen his belt; place him in a seated position. With the heel of your palm, strike between the shoulder blades in a downward, forward direction. The blow is snappy and should be repeated once or twice. The action is intended to stimulate the circulatory and nervous systems.

739. For someone who is more dazed but not entirely unconscious, loosen his belt, place him in a seated position. Kneeling behind him, place your knee between his shoulder blades; place your hands in front of his lower abdomen. With a snappy action, pull upward in the direction of your knee; let go quickly. Repeat twice.

740. When subject is completely unconscious, lay him on his back, loosen his belt. Place the heels of your palms into his lower abdomen. With short, jerky movements, thrust and release several times. The direction of your thrust is upward and back.

741. Alternate the above action with a pressing, jerky action just below his rib cage in a downward direction.

RESUSCITATION FROM ACCIDENTAL GROIN BLOW

742. If subject has received only a moderate groin blow and is still fully conscious, instruct him to jump stiff-legged, as shown, landing on his heels so that he is jarred as much as possible. Pain is relieved by massaging downward on the abdomen toward the groin.

743. If subject is almost unconscious or in severe pain, place him on his back, loosen his belt; his legs are spread. Kneel at his right side, hold his toes so that his leg is fully extended, as shown. Strike sharply onto the sole of his foot using the side of your fist. The direction of the blow is toward his hip joint. Do not let his leg bend. Repeat several times until pain is relieved. Finish by massaging his lower abdomen down toward the groin.

744, 745, 746. Subject is unconscious as the result of an accidental groin blow. Place him in seated position, put your arms under his armpits. Raise him a few inches from the mat and sud-

denly let him go. Make sure he does not fall to the side by bracing his upper body slightly. Repeat several times. Finish by massaging lower abdomen down toward the groin.

HOW TO TAKE THE TEST FOR BLACK BELT RANK

The test for black belt rank should be given by a board of three black belt holders.

The amount of time, practice, devotion, and involvement which is required for the achievement of black belt rank puts this degree in a special category. To pass this test, technical excellence far beyond the average, broad general knowledge and knowledge of special and classical techniques is needed. In the previous tests, proficiency has been rated for work which is closely related to the practical use of jukado; in this test, the material goes beyond the practical. For this rank the student must have skill of a superior order and erudition in the field which covers a wide range of related subjects. The aspiration of every serious student of the unarmed arts is to reach the level characterized by the privilege and honor of wearing the black belt (or equivalent symbol). The requirements and the test are geared to measure achievement and ability which are appropriate to the honor.

Whereas in previous tests a score of 75% is passing, for this test a score of 90% is needed to pass. This only allows for the margin of error which the pressure of normal nervousness might account for; it does not permit any gross errors in the execution of the work. Every aspect of the demonstration is expected to be on a high level. Perfection of technique, precision and speed of response are graded critically. Above all, the quality of imagination and creativity must be considerably above that shown in demonstrations for the previous rank advancements.
